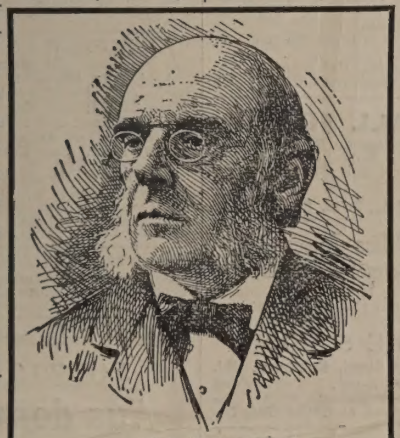
Memories of Yale Life and Men

By TIMOTHY DWIGHT, D.D., LL.D.

Doctor Dwight has been actively identified with the development of Yale, in every way, for over half a century, and for that reason he is eminently qualified to write of the varied phases of Yale University Life. He has come in close personal contact with many of the instructors and students, and the book contains many intimate touches which appeal to every reader, whether he be a graduate of Yale or not.

"These are delightful memories, full of ripe wisdom, kindly feeling, and a fund of reminiscence of wise discourse on the changes and the causes of changes that have gone on in half a century at Yale. A strong love for the university and belief in its spirit glow through the book; there is gentleness of spirit shining upon every page, and in his judgments of the many men at Yale whom he knew there is always the greatest insight, justice and tolerance. It will mean much to Yale men of all ages."—*New York Times.*



DR. DWIGHT.

"There is much thought introduced in his comments on the fine significance of the changes that have come about in Yale's methods of recent years, and he is seen to be ready to make progress with modern ideas conservatively and safely. He believes in the soundness of the present day youth, and is not alarmed at the apparent increase of luxury. It is of course primarily to Yale men that the book will appeal; but it contains much which is of great value to the educationalist and the student."—*N. Y. Commercial Advertiser.*

"It is of especial value to all those interested in educational questions."

Books on Scientific Socialism.—Catalogue free. CHARLES H. KERR & Co., 56 Fifth Avenue, Chicago.

AN EDUCATIONAL DIRECTORY.

I.—THE NATION stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in THE NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12 1-2 per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 206 to 210 Broadway, N. Y.

The Nation.

NEW YORK, THURSDAY, JULY 2, 1903.

The Week.

In directing the Attorney-General to proceed vigorously in the postal cases the President declares unmistakably for publicity. He is against the Postmaster-General's theory that, for the sake of Mr. McKinley, these "old, unhappy, far-off things" should be let alone. The letter to Attorney-General Knox will not rank among Mr. Roosevelt's great state papers—usually he more than makes up for tardiness by vigor; but the letter as it is will get a careful reading in the Post-Office Department. When Perry Heath reads of the "prosecution of guilty men, whether in the service or not," he will find a suggestiveness in the phrase which fully atones for any lack of epigrammatic form. The lachrymose Payne, too, will admit that the order to go over his head arouses thoughts too deep for tears. On all hands it is matter of rejoicing that the President, who seemed caught for a time by Mr. Payne's blundering casuistry, has finally declined to enmesh himself in the sophistry that both virtue and official wrongdoing died with Mr. McKinley.

President Roosevelt has made an unequivocal declaration of purpose in his appointment of Charles Jerome Bonaparte and Conrad Holmes as special counsel for the prosecution of the postal frauds. Both men have a national reputation as lawyers and as public-spirited citizens. Neither could have undertaken such a task except on the understanding that the rascals are to be hunted down without fear or favor. The President's own character was a guarantee that the work should be thoroughly done; his often-expressed scorn of the craven and weakling was a promise that, however his subordinates might hesitate or tremble as the trail of corruption led to the doors of men high in Republican counsels, he at least would not blench, even if jumping on Perry Heath and his Congressional backers were more painful than the ordeal of hot ploughshares. But now the President has made his implicit promise explicit. The selection of Mr. Holmes, a distinguished Democrat, is not only a proper step in itself, but is a clever political move. It will disarm partisans, for if any man under suspicion now escapes the clutch of the law, most people will believe him either innocent, or else too shrewd to have crossed the boundary between indiscretion and actual guilt.

From the President's direction that the postal investigations must all be "finished up before fall," the inference will, of course, be drawn that he wishes to forestall a Congressional inquiry. It is a question, however, whether the matter can be safely hurried up. In such a diversified and intricate system of corruption as has been little by little establishing itself in the Post-Office Department, there are necessarily parts which it will take a long time to explore. One step leads to another. Evidence turns up unexpectedly. It is not possible to fix a day by which the last nook and cranny can be confidently said to have had the light flashed into it. Besides, it does not seem probable that Congress will or should keep its hands off, in any event. The House is still the grand inquest of the nation. It is especially its business to look into the waste of the people's money. And we are not likely to get the full story of the political intrigues and entanglements which lie behind the looting of the Post-Office until some of the principals make a clean breast of it before a Congressional committee.

Ex-Postmaster-General Smith's second attempt to explain away the Tulloch charges does not seem to us more successful than his first. No one ever accused him of personal dishonesty. What he was charged with was winking at "irregularities" (polite for violations of law), and with having a dull sense of official propriety. This last letter of his is alone enough to convict him on either count. He has his formal "Exhibit A," "Exhibit B," and so forth, but the really glaring exhibit is his innocent statement that he had an estimable friend whom he would have been "a brute" not to help, and that he proceeded to do it by putting her on the Government payroll. That is to say, he used public office as a means of discharging private obligations. To have done that, and then to be capable of boasting of it, gives us the measure of Mr. Smith's official scrupulousness. He was, in this respect, in the same boat with Beavers and Machen. They, too, regarded appointments to office as their personal perquisites.

"Never," says the Nashville *American*, "since the adoption of the Fifteenth Amendment, has the negro question been so conspicuously in the public eye." This is the literal truth. The newspapers North and South are witnesses to it. It is a national question now full upon the whole nation. "What is to be done?" asks the *American;* and its answer is: "Either repeal the Fifteenth Amendment, or disfranchise the negro in every Southern State." Yet we are told that we must "let the South alone!" Mr. E. M. Shepard goes to address a Southern audience, and tells it that he has no sympathy with Northern men who doubt the South's ability or willingness to be just to the negro. At the very moment, the leading organs of public opinion at the South make no concealment of their purpose to strip the colored man of every political right. Of course, they say they will do it "for the negro's own good." No tyrant or oppressor ever failed to use that plea. It is just as valid for robbing our foreign-born citizens of the suffrage. If a dictator comes along some day and suppresses popular institutions in the South, he will do it for the good of his victims, and will tell the Southern editors that their ballot is only a bauble of which it is a real kindness to deprive them.

The aspect of the negro question to which Northern newspapers are just now giving most attention is the peonage cases. The revelation of a systematic new slavery has aroused consciences which seemed dormant in the presence of merely political wrongs. A cursory inspection of the more important newspapers of the North and West will show with how keen an interest the details of the peonage barbarities are followed, and how closely the trials of the guilty slave-drivers are watched. Several special correspondents have been sent to Montgomery to report the cases on trial before Judge Jones. One of them, writing to the Chicago *Chronicle*, quotes "a distinguished citizen of Montgomery" as saying:

> "There is one phase of this unfortunate affair which causes me more sorrow than any other. Where is the aroused public indignation which ought to follow such disclosures? What is the matter with the press of the State, with the priesthood and with the enlightened men and women of this district? Why do they withhold their condemnation of this great crime? Their silence is a serious handicap to the Federal officials who are seeking to bring to justice the men who are guilty of peonage. It encourages another class to stand out in direct opposition to the law, and circulate perverted and lying stories about the motives which control the acts of the Federal officers."

The plea of guilty in the chief of the peonage cases at Montgomery was a striking testimony to the completeness of the proof which the Federal prosecuting officers had amassed. It was the ringleader of the whole nefarious business who was caught. This man Pace, who was sentenced to five years' imprisonment by a righteous judge, himself a Southerner—Judge Jones—has been a sort of combination of feudal baron and wholesale slave-driver in the county which was the scene of his operations. A large landowner, with many plantations and mills requiring labor, he has

been the most arrogant and cruel of the men who have practically enslaved helpless negroes. It has been the boast of these new slave-owners that the proclamation of emancipation and the Thirteenth Amendment did not "go" in their counties. Absolute masters of the local politicians and the minor courts, they have until now been able to snap their fingers at the law. But the long arm of the nation has seized them at last. Pace is out on bail, pending an appeal to the Circuit Court; but the moral value of his conviction must count tremendously. It is a blow between the eyes for the very Front de Bœuf of the peonage iniquity.

Mr. Hay's circular in behalf of the persecuted Rumanian Jews is undoubtedly the precedent followed by the President when he agrees to forward to the Czar a memorial on the Kishenev massacres. Temperamentally, Mr. Roosevelt would be inclined to associate himself with the American Hebrews who plead for their oppressed co-religionists in Russia, and it is proper, perhaps, to regard his action as personal rather than official. The Russian Government would relieve an otherwise awkward situation by taking that view of the case. The President joins in pious wishes that the Czar will deal justly with his Jewish subjects. With the cause everybody must sympathize; the expediency of the action itself is, however, open to doubt. Mr. Hay's more formal overtures in behalf of the Rumanian Jews accomplished nothing beyond expressing our national concern in the matter. Moral criticism of the internal policy of a foreign Power not only transcends the scope of diplomacy, but possibly of common sense also. Conceivably, a happy island, whose disinterestedness was beyond question, might assume gracefully the superior rôle of moral censor. Mr. Roosevelt's dispatch, however, will have to be dated, not from New Atlantis, but from about the latitude of Wilmington, Delaware.

The struggle among the Iowa Democrats, which culminated in the State Convention on June 24 in a refusal, by a vote of 464 to 353, to reaffirm the Kansas City platform, is not a new one. In the 1901 convention a majority report of the Committee on Resolutions presented a platform which ignored the silver question. This was met on the floor by a minority report, and, after a bitter debate, the convention inserted a plank declaring, "We hereby reaffirm the principles of the Democratic national platform adopted at Kansas City, July 5, 1900, and, without surrendering our convictions or abating our loyalty to our national policies, we believe this campaign to be particularly one that should be confined to State issues." The vote by which this plank was inserted was 669 to 550. Last week's vote against reaffirmation shows that the majority has veered to the other side, and doubtless marks the beginning of an even more rapid decline of Bryanism in Iowa. No reference whatever is made in the platform to the former national platforms, and the slate is accordingly wiped clean, ready for a new record.

It has become somewhat the fashion to look to Iowa for party leadership in questions relating to the tariff, and for this reason the tariff plank of the Democratic platform is interesting. It is brief but very much to the point. It says: "As the most alarming features of our present conditions are the evils which come from the Trusts, we call for the removal of the tariff from all Trust-made goods, and demand that all tariff schedules be adjusted with a view to tariff for revenue only." Nothing could be more simple than this, or cut more directly to the root. The platform refers briefly to the postal scandals, and in a tone which is at once temperate and firm. An investigation by a Congressional committee is called for; but whether this demand will become a leading feature of the campaign in Iowa and other States depends, of course, upon the vigor of the housecleaning now going on at Washington and in the various post-offices throughout the country.

There is a strong presumption of truth in the report from Washington that Speaker Cannon is going to set his face like a flint against currency legislation next winter. "Uncle Joe" has never shone in financial reform. He was born too early. The silver and greenback microbes got too firm a foothold in his system ever to be completely expelled. In the important measures looking to the establishment of the gold standard, Congressman Cannon has played but a minor rôle. The really alert and aggressive men like Fowler and Hill and McCall got little but sneers and objections from him. It is clear, therefore, that his sympathies and inclinations would be against even that moderate legislation which convinced currency reformers have, with the approval of the President, urged the Republican majority to enact at the coming session of Congress. It is a bold thing for the Speaker to challenge the announced policy of the President and powerful Senators of his own party, but that is apparently what Mr. Cannon has done. At the same time, we suspect that the Speaker takes this position only as a part of his campaign of resistance to a presumptuous Senate. A group of complacent Senators, headed by Mr. Aldrich, have undertaken the task of preparing a currency bill. It never occurred to them to consult the House. But Mr. Cannon sharply reminds them that they reckon ill who leave him out. He has before expressed his deep disgust at the stand-and-deliver methods of the Senate, as confronting the House. The signs are that he means to reassert the ancient dignity and privileges of the Representatives.

The Missouri legislative investigation daily furnishes more information in regard to the ways of great corporations. Lieut.-Gov. Lee's statement, supplementary to his testimony of last week, dwells upon their naturally friendly disposition, and the gratitude with which they reward those who have been kind to them. These Trusts are not unfeeling monsters, after all. They feel keenly that almost every man's hand is against them, and it is really touching to see how they respond to little kindnesses. Here is the Tobacco Trust, for instance. It was little enough that Mr. Lee did. He merely "wrote the obituaries of some of them, and boosted others when they got promotions," yet these little seeds of kindness sprouted into fifteen fifty-dollar bills for his campaign fund. This payment was far above the scale of the obituary writers' union, but it may not be altogether easy to write prose elegies on a Trust promoter. The rate is but little higher, at least, than that paid by the Sugar Trust for Mr. Lee's pamphlets. The exact nature of the Lieutenant-Governor's "boosting" is not disclosed, but we are assured that the Trusts' helping hand in return was "simply an act of friendship on their part and nothing more."

The slight extension of municipal ownership which Mayor Low now favors in connection with the Staten Island ferries is evidently a step to which he has come reluctantly. It is taken only after the failure of other proposed solutions of that particular transit problem. The railroad and trolley companies involved could not come to an agreement, and the city authorities therefore pass on to the alternative of municipal purchase and control of the Staten Island terminals and the ferryboats running to them. Even so, however, it will be observed that no proposal of operation by the city is positively made. A lease to some operating company is seemingly contemplated. This illustrates the caution with which the Mayor feels bound to approach the whole question of public ownership and management of business which can be better done in private hands. He might well hesitate to embark upon any such enlargement of the public service in view of the Post-Office revelations, which have given the advocates of the "ownership and control of public utilities by the people" a knockdown blow. Be it remembered that the Post-Office has long been their chief boast and argument. As-

sert that a great public business cannot be dispatched honestly and efficiently by the municipality or the State direct? Why, look at the postal business! There you have a very model of the kind of thing we mean. If we only had the telegraph and the telephone and the railroads "nationalized" in the same way, and the cities in immediate control of gas and electric lighting and street-car operation, this would be a country of the blessed.

In view of the recent warm discussions over the bank position, the prices of stocks, and the allied problem of "undigested securities," returns of the national banking system as a whole are peculiarly interesting. Five times a year the Comptroller of the Currency calls for these returns from all the 4,900 national banks at once. The result is a comprehensive picture of the state of the country's cash holdings and credit fund; for although the report does not cover the direct operations of the State banks, the trust companies, or the savings and insurance institutions, it is recognized nevertheless as a fairly correct exponent of the movement in them all. The past three months, and in large measure the past year, have been commonly described as a period of liquidation—notably on the Stock Exchange. Yet the first thing that strikes the eye in the Comptroller's figures, just compiled from returns under the June 9 call, is the fact that loans of the national banks have increased $11,828,000 over April 9, and no less than $193,186,000 since the report of last July. Deposit liabilities have increased $102,117,000 during the year, while cash reserves have not only not increased in an equal ratio, but are smaller by $17,409,000 than in the middle of 1902. It will naturally be asked, why should the loan account have increased at this portentous rate—the expansion over last year is fully 6 per cent.—if liquidation was general on the markets? The answer is, that trade at large has been rather more active even than a year ago; that high prices prevalent in many industries have required a larger use of capital to conduct them; that the various syndicates have continued, until very recently, to borrow extensively for their undertakings, and, finally, that our banks have had to take up a mass of loans previously placed in Europe. When this series of operations is considered, and with it the fact that cash reserves of the banking system as a whole have decreased in the period, it should be easy to understand why forced liquidation followed the line of least resistance—namely, Stock Exchange securities. Possibly, too, these figures may enlighten people who have cheerfully assumed that, once the "shake-up" in stocks was reasonably complete, renewal of last year's wild speculation might be looked for.

Mr. Wyndham's surrender to the Irish appears to be complete. The minimum rate of land purchase has been abolished, so that landlords and tenants may make such bargains as they choose, while the Government bonus has been largely increased. Though a fairer arrangement than that which fixed an arbitrary minimum price for farm lands, this is a costly way of maintaining the principle of special inducements for sale under the act, and it may somewhat reduce the number of sales. Under the original arrangement there was a kind of moral obligation upon a landlord to sell to any tenant who offered the legal price. Now, such a transaction becomes more or less a matter of bargaining on either side. The bill as amended is fairer, but on the whole weaker. Too great hopes have been pinned to it in the first instance, and the present radical modification makes the new Land Bill appear more than ever simply a payment on account—not the liquidation of England's debit balance to Ireland. The compromise, or rather surrender, should serve its immediate purpose of holding the Irish Nationalists to their wavering allegiance. It also emphasizes the fact that Mr. Balfour is in the hands of those who cannot honestly be called his friends.

Austria and Russia alone participated in the reception of Peter I. at Belgrade. Both these nations have condemned the assassination, and both accept its results. As guardians of Servia they refuse to break off relations, quite as parents will sit in the prisoners' box with a guilty son. That is the real significance of the solemnity at Belgrade. The Powers which have refused to recognize the *de facto* King have inflicted a rather empty diplomatic slight upon him. They are really—whether formally or not—represented by the Russian and Austrian Ministers, who would in an emergency act for any or all of the absent envoys. It is needless to add that a joint withdrawal of the Ministers would never have been considered in the case of a first-rate Power, no matter how blood-stained its new dynasty might have been. The hesitant and, on the whole, futile rebuke now administered to Servia is evidence of the inevitable bankruptcy of diplomacy before any issue of pure morals.

When Mr. Chamberlain declares that England is "on the eve of a great controversy," he must mean a contest at the polls, with his scheme of preferential tariffs as the main issue. In a letter to a constituent he speaks of it as the coming "big fight." This makes it clear that the present Cabinet does not expect to go on for long. The "open mind" cannot be left so wide open that all manner of antagonistic opinions find lodgement in it. Even the Duke of Devonshire, Government leader in the House of Lords, admitted the other day that the position of the Ministry, rent by such sharp divisions, was "difficult." Yet he maintained that it was not wholly "impossible." Why could not good men agree to disagree? Above all, why should any Minister resign? On that subject the Duke was fairly plaintive. Was Mr. Chamberlain bound to quit office because the Chancellor of the Exchequer would have none of his new-fangled notions? Should Mr. Balfour resign simply because he couldn't make up his mind either way? Come to think of it, why should anybody ever resign? The Premier's speech which saved the awkward situation for the time being was, no doubt, adroit with the cleverness of a man who had a nominal party majority behind him that did not want to be turned out of power. But it was, after all, only dangerous balancing on a tight rope. He is certain to fall one side or the other. In fact, that grieved protectionist, Mr. Chaplin, asserts that Mr. Balfour has already fallen. "You say you have no settled conviction; that you will inquire and keep an open mind; yet you begin by striking off the only duty that looks our way." But Mr Chaplin is quite too blunt and crude for these new-fashioned Parliamentary refinements. He should have done as Mr. Chamberlain did—denounced the repeal of the grain tax, but voted for it just the same.

On the reballoting in the Reichstag elections the Socialists have increased their total seats to 81, nearly twice their strength in the last Reichstag. The reduction in the Centre and Conservative delegations—about one-quarter in either instance—increases the probability that the Government will be hard put to it to make up a majority. It is even likely that the Chancellor, taking a leaf from the French and Italian book, may attempt to gain support from the Socialists, who very nearly hold the balance of power. The spectacle of the Clericals and Socialists pulling together would be odd enough; but before this politics has made stranger benchfellows. A minor result is the reappearance of the Radicals, who failed to win a seat on the first balloting. With 36 members, in three groups, they will be able to continue their valuable work of presenting genuine Liberal ideals to a body generally given over to petty politics. The able leader, Dr. Richter, has been returned by a handsome majority, and Dr. Barth has gained his election. Generally speaking, the time seems favorable to an alliance between the Radicals and Socialists. Nothing can be predicted of the new Reichstag until the Social Democrats have determined on a policy—to accept a bribe from the Government, or to continue the work of opposition.

THE LYNCHING MADNESS.

Bishop Butler once speculated on the possibility of a whole people going mad. That the general brain may suffer a lesion resulting in what looks like popular insanity, indeed, is arguable with a good deal of force. The early stages of lunacy in the form of "fads" and "crazes" often manifest themselves in whole communities; and, as we are unhappily seeing just now in the outbreak of barbarous lynchings, East and West, North and South, the thing sometimes mounts to acute mania.

An alienist might easily detect in the bearing and actions of the frenzied mobs many of the symptoms of dementia. There is the wild obsession, the insensate fury, the cries, the howls, the "fixed idea," the rage knowing no bounds. It is a point at which the psychology of the crowd most strikingly reflects the mental condition of the individual maniac. But the madness of the mob is worse than that of the single man, because it is infectious. One crazy band bent on murder incites another to bloody-mindedness. In these days of quick communication, impulses pass swiftly from one section of the land to another. It is like the inmates of adjoining padded cells in Bloomingdale stirring each other up by the example of shrieking and foaming at the mouth. A mob at the South bellows, and presently another in Belleville, Ill., takes up the hoarse cry. Thence the mania passes on to Indianapolis, only to break out later with redoubled fury and with every refinement of cruelty at Wilmington. We almost seem to be beholding the fancy of Butler come true, and an entire nation losing its reason.

This conception of the passion for lynching as a vast wave of madness, inundating people by the thousand, is one, it seems to us, which is fitted to heighten our sense of public peril as we confront the startling phenomenon. Where it will declare itself next, no man can tell. It is the instant and urgent duty of all sane men, and of every community not yet bedlamized, to gather up all the resources we possess against this threatening evil, which has already become a stinging national disgrace. For there is method in this madness. It takes its origin, as everybody can see, in the notion that there is one class of men beyond the pale of the law. Mind, we say class of *men*, not class of crimes. Not all bestial outrages or ferocious murders are punished by mob law and with every circumstance of atrocity, as was the horrible crime by the more horrible lynching in Delaware. The trembling brute who was burned to death spoke the simple truth when he told his tormentors that he would not have been dealt with in that savage fashion had he not been a negro. Not all monsters of depravity are black; yet where do we hear of the red fury of the mob turning so upon white fiends? No, the idea is abroad that "niggers" may be hunted like wild beasts. Beginning by attempting to de-citizenize them, we have passed on to considering them de-humanized. We deny them the inalienable rights of every human being under our laws. For the white criminal the orderly processes of the law, the court, the sentence, the noose; but for his fellow in crime—that is all he is—the colored man, there is nothing but the howling of the mob and the leaping flame.

This is the first and great warning which the lynching mania speaks to every man who will hear. Class prejudice is at the bottom of these ferocities. In Bessarabia it is the Jew who is the outlaw, and who may with impunity be massacred because he belongs to a hated class; in America it is the negro for whom the most sacred guarantees of the law simply do not exist. Discrimination against a man because of his race or color shows us, in the insensate mob at Wilmington, into what wild animals it turns human beings when it does its perfect work. And we have not the slightest security that such class prejudice, erected into the controlling passion of the mob, will stop with any particular race or color. Any day it may suddenly be declared, and adopted in practice, that other classes of men, other races, other colors, are fit only for lynching. When once you depart from the principle that all men as such have fundamental and equal rights, or from the duty of doing justice even upon the vilest under the strict forms of the law, you cannot tell to what fearful and bloody consequences you may be driven.

That is really the alarming aspect of this invasion of old communities by the lynching habit. It threatens to burst the social bond itself, and make us all cave-men again, every one taking justice into his own hand. "Rough justice" lynching has been called by its apologists. We perceive the roughness, but not the justice. Society exists at all only because individuals agree to put their private griefs into the hands of the ministers of the law; and every attempt by individuals or by mobs—be they "mobs of gentlemen"—to wreak vengeance on their own account, is a stab at the life of our society. How deep our shame as a nation should be at these awful barbarities, no one perhaps can fully perceive who does not read the foreign newspapers. The story of our lawless ways is telegraphed to them in all its ghastliness. Englishmen, Germans, and Frenchmen have been thinking of Americans at their breakfast tables just as we were thinking a few weeks ago of the murderous Russians at Kishenev. The stain has come upon our country's name at the very moment when we were loudest in protesting against the atrocities of others.

What violence can do as a remedy for violence, we see in the secondary rioting in Wilmington, with the threats of disturbance in other parts of Delaware. The Governor seems to have taken the novel view that if the mob were only given its head, and whites and blacks allowed to fly at each other's throats for a time, everything would soon settle down into a beatific calm. It was reserved for Richmond to teach the real stern lesson to mob rule. The application of martial law with an iron hand, open orders to the troops to shoot the first rioter that showed his head—that was the way they did it in Virgania, and it is the only way to deal with murderous lawlessness, as the history of government has shown, before and since Napoleon's "whiff of grapeshot." The moment that a public official dallies with men who set the laws and courts at defiance—worst of all, cowers before them and allows them to sway the action of the sworn guardians of order—that moment does he endanger the whole fabric of government. As for the riotous negroes of Wilmington, what moral had the white mob taught them but the one they drew—namely, that the way to secure their rights was not to appeal to the authorities, but to arm themselves and strike terror into every heart?

NEW PHASES OF THE LABOR CONTROVERSY.

Ever since free labor replaced the work of slaves, the relation of employer and employed has been essentially unchanged. The master asks: "What wages must I give?" The man's one inquiry is: "What wages can I get?" In the give and take involved in the answers to those two questions, we have in a nutshell the history of the labor movement. It changes in its manifestations from time to time; it is affected by alterations of law and of public sentiment; it is influenced by the development of political institutions; but, at bottom, it is always the same. Behind all trades-unions lie the factors which ultimately determine the rate of wages and the lot of the workingman. No organization, no rhetoric, no jugglery can conceal the fact that laborers can be paid only for efficient production, and only as much as their employers are able to give them without being ruined themselves.

Nevertheless, the varying phases of the controversy are perennially interesting. The real question is, in the last analysis, one and simple, but it presents itself in many complex guises. Just at present, for example, we are witnessing a marked shifting of the scene and stress of the age-long trouble between capital and labor. The striking and novel feature to-day is the combination of employers to withstand the onset of combined unions. It is not wholly new. Several years ago the employing print-

ers of this city banded together in such an organization for their common defence. Every one knows how the master-builders of Chicago were compelled to stand together as one man to resist the impossible demands of the building trades. The point is that the movement is now greatly expanded, and promises to become universal. We hear of it in Pittsburgh, in Charleston, as well as in New York. It is extending to many industries. It is distinctly the latest aspect of a very old quarrel.

In its presence labor leaders have displayed much uneasiness, not to say indignation. This idea of combining was really wicked—when it was a combination against, not by, themselves. They even applied to District Attorney Jerome to proceed against their employers for conspiracy! But he quietly reminded them that they were the last persons on earth to talk about illegal combinations. In reality, they had no reason to be surprised at this final resort of the employing builders. The union game was to combine all the building trades into one, and then to pick off the separate builders in detail. It was certain, however, that the process would not be allowed to run a long course. The employers have at least as much acuteness as the workmen. To deal with a massed body of unions, they simply devised the counter-union of contractors. It was an inevitable return blow. It does not, as we have said, alter the fundamental nature of the everlasting wage dispute. Indeed, it only brings it out more clearly by restoring something like equality between the two parties. As the individual employer used to confront the individual workingman, so now the united employers face the combined unions. And the questions to be asked and answered are the familiar ones: "How much can we get?" "How much can we afford to pay?"

The instructive thing is that none of the changes in the recent organization of either capital or labor have, in fact, proved to be the panacea that they were hailed to be in advance. Labor unions are stronger than ever, more "federated" than ever; yet they have only called out a stronger force on the other side. The deadlock is just as complete as if it were one man striking against a single master. The most powerful unions have simply learned the old lesson—that there is a point at which their excessive demands necessarily break down, since there is a point at which the owner would rather see his business go to wreck than to have the control of it taken out of his hands, or to submit to a wage scale which would wreck it anyhow. Nor does the cure-all of the Trust appear, on the other hand, to any better advantage. It was a part of the current nonsense about Trusts, two or three years ago, that they were to solve permanently the labor problem. We now see that they have rather inflamed it. In the first place, labor leaders have been quick to take the hint, and to form a Trust of their own; in the second place, the huge and top-heavy combinations of capital, with a sensitive stock market attachment, have been peculiarly vulnerable as they have been especially timid, have invited attack in a thousand ways unknown before, and have helped to make the last state of the labor movement worse than the first.

Both sides ought to learn something from this recent experience. The unions should perceive that organization cannot take the place of character. Their blackmailing agents have dealt organized labor a fearful blow. Until it abolishes these arbitrary and corrupt walking delegates, it cannot expect to enjoy the respect of good citizens. Nor can the corporations which prefer illicit relations with labor manipulators hope to fare any better. It is well understood that there are some such in this city. They find it easier to have a regular scale of blackmail, which they pay the walking delegate, than to insist upon open contracts, lived up to on both sides to the letter. Like the corporations which pay bribe money or fright money to Tammany, they would rather be bled secretly than fight in the light of day. They are as corrupt at heart, and as dangerous in operation, as any walking delegate or Tammany collector that ever took their money. There is no final peace to be had in the business or manufacturing world—no "peace without a worm in it," in Cromwell's phrase—which does not rest upon honesty, fair dealing, and the looking of all the facts, economic and moral, squarely in the face.

PRIMARY REFORM.

Massachusetts, which has always been a leader in election reforms, has just adopted a direct-nominations law. It is to go into operation in Boston immediately, and to be applied to other cities of the State when accepted by the local authorities. The new statute provides that party primaries shall be held at a common date fixed by law, and at the same hours and places in the various districts. The regular election officers or inspectors are to attend, and everything, from the printing of the ballots to the counting and preserving of the vote, is as official as on election day. Each candidate for a party nomination must obtain blank nomination papers from the secretary of his organization, and, in order to be placed as a candidate on the official ballot, must secure a limited number of signatures—five for a ward candidate, and five for each ward where the district involved is greater than this unit.

On primary day the elector announces the party in whose nominations he chooses to participate, retires to a booth after the ticket has been handed him, votes in secret, and deposits his ballot under the official supervision of representatives of both parties. For the first year there will be no enrolment, but a record is to be kept, showing which party the voter selected, and thereafter he may not participate in a primary of any other party without first having his previous enrolment annulled. This is a process requiring ninety days' delay. Manipulation across party lines is thus effectually checked.

Another feature of the new law, and one which might well be applied to our own system, provides for municipal parties, and permits them to participate as such in the official primary. In general, the law provides that to be recognized as a party an organization must poll a certain per cent. of the vote for Governor, but exception is specifically made in favor of organizations of citizens taking part only in municipal affairs. An enrolment in one of the national parties does not prevent an elector from voting in the primary of one of these municipal organizations. It should be noted, of course, that this latter provision is not as confusing in Massachusetts as it might be in New York, for the reason that in Massachusetts the idea of separating national and State from municipal elections has been carried to its logical conclusion, the municipal elections being held, some in December, and some in the spring, instead of at the time of the general election in November. The movement which has resulted in the passage of this law in Massachusetts has been thoroughly non-partisan in its nature. Leaders of both of the two great parties have given it their support. The new statute bears evidence of having been carefully drawn. Especially in its provisions to prevent corrupt combinations between the baser elements of both parties, there are evidences that the experience of other States has been carefully studied.

One striking feature of the movement for direct primaries is the rapidity with which it is spreading. Many of the Southern States have long observed the principle, though the element of official regulation, which is basic in the systems adopted by the Northern States, has been for the most part lacking in the South. We are chiefly concerned, however, with the progress which has been made in States where political conditions more nearly resemble our own. Of these, Minnesota, Maryland, New Jersey, and now Massachusetts have adopted the system with various modifications. Wisconsin has considered it, and would be using it to-day, but for the dissatisfaction of Gov. La Follette with the details of a bill passed in 1902, which he vetoed. This year he had no chance to pass on a primary bill, though this was one of the chief issues of his campaign, the Senate

effectively blocking all attempt to change the convention plan now existing in Wisconsin. There are indications, also, that Michigan will soon join the ranks of States having the direct primary.

No two States have adopted exactly the same system, but the statutes are similar in that they provide for official supervision of the primary, and direct voting for the candidate without the intervention of delegates or conventions. In New Jersey this direct voting is confined to candidates within the smallest political unit, and an attempt has been made to preserve the conventions for the larger nominations, electing delegates only by the direct plan. Other variations relate to the matter of eligibility of electors to vote in the primary. In Minnesota, which was the pioneer State in adopting the direct primary, its most obvious defect was early discovered. The thugs of both parties joined together in Minneapolis and took "Doc" Ames from the gutter to nominate him for Mayor. To forestall similar evils, the Minnesota law has been amended so that, when challenged, an elector may be barred from the primary if it can be shown that he is not an adherent of the party whose ballot he has selected.

In Maryland, on the other hand, the election officers are required to state to the voter that participation in the primary does not bind him to support the candidate named. If the Massachusetts law is an expression of the latest tendency in this matter, it will be seen that it inclines to hold the voter more and more strongly in his choice when made. This applies to the primary, not to the election. Any obligation to vote at the election for the candidate of the party in whose primary he participated must ever lie, of course, solely between the elector and his conscience. With the secret ballot no coercion could be successful, even if foolishly attempted.

It is unnecessary to point out that the increasing strength of this movement in other States must profoundly affect the minds of our own citizens, especially in New York city, where both parties are suffering intensely from boss rule. Some of the best features of the system which is so rapidly growing in popularity, we have possessed in this State since 1898. Our primary is under official supervision, and no other State has an enrolment system equal in efficiency to ours. But our primary unit, nominally the election district, is in fact the Assembly district, and our nominations are far from being made by the people. For many years New York led in the matter of primary reform. Some advance steps must soon be taken unless we are to lag behind.

"AMERICANIZATION" OF WESTERN CANADA.

The Western States show some nervousness over the recent large emigration to the Canadian Northwest. It is probable that the number of farmers moving across the border this year will be greater than last, despite the fact that the newspapers of the Middle West are giving much space to warnings against seductive tales about the new farming region. They call attention to the long, cold winters, and to the restriction on crop diversity by reason of the brief summers. They lay stress upon the differences in government. Nevertheless, well-to-do and prosperous farmers are selling their prairie lands and are going with their families into the comparatively unbroken territory of Alberta and Assiniboia.

A part of this emigration is traceable to generous advertising in the country weeklies throughout the West. It is placed by the Canadian Government. In practically every little "home paper" between the Mississippi River and the Rockies are displayed the flattering statements of what is offered to farmers who will journey to the Northwest. These announcements, with other advertising matter, have changed the Western farmer's conception of the Canadian Northwest, which he formerly looked upon as akin to Siberia. As a result, the movement to the new section has grown remarkably. In 1896 only thirty-six people were listed by the Canadian Government as having come from this country. In 1900, despite the good crops in the West, the number was 5,791; in 1901, 18,000, and last year it rose to 37,000. The immigration to the same region from the provinces of eastern Canada, from Continental Europe, and the United Kingdom was last year over 39,000. It is estimated that 50,000 English will this year seek homes in the new lands, and perhaps as many Americans.

Upon such figures as these, Western statisticians build theories of the "Americanization" of Canada. They foresee a revolution of sentiment among the Canadian population, by reason of the working of this leaven of farmers from the States, which will in the near future bring about annexation, or the establishment of a new republic. They forget, however, the rapid and increasing introduction, beside the people from this nation, of many more from other countries, and that the whole trend of the influences among which the new comers are to be placed is fully as likely to "Canadaize" the recent settlers as vice versa. While the interests of western Canada are somewhat separate from those of the eastern provinces, and its development is still in the embryonic state, the strength of the British sentiment is none the less notable. The population of the Northwest Provinces before the rush of immigration began in 1901 was 413,898, of which 246,892 was of British origin, with nine-tenths of the remainder European. It will take a long time for immigration from this country to catch up with such a lead.

Few realize the immensity of the cultivable lands lying north of the boundary. Col. G. E. Church has estimated the area available for wheat raising in the Canadian Northwest at 400,000 square miles, or four times that on which wheat is grown in the United States. Only one per cent. of this area is under cultivation. Manitoba and North Dakota began wheat-raising about the same time; yet while Manitoba had in 1901 2,212,000 acres, ten contiguous counties of North Dakota had 2,894,000 acres. It is said that one county of North Dakota had last year more land in wheat than all of Manitoba. Of course, these comparisons will soon lose their point if the present rate of immigration from our own West continues, for there will be opened a vast area of now unbroken plain.

At present, Canada's transcontinental trade passes south of Lake Winnipeg, and therefore within sixty-five miles of the United States border. This leaves the transportation lines in a very unfavorable position strategically. There is under consideration, however, the Trans-Canada Railway from Quebec to Port Simpson, passing north of Lake Winnipeg and but a hundred miles south of the southern extension of Hudson Bay. This road would tap the northern wheat lands, and would shorten the distance between Europe and Japan by 700 miles. If it be true that Canada's trade movement is at present tending to bring her into closer relations to the United States than to England, the projected road would probably have a counterbalancing effect, through its direct connection with the English business world. With over three million acres homesteaded last year, and railway land sales of three million acres more, the settlement of the yet unoccupied stretches will be a matter of but a short time.

Whatever our Western States think of this movement, it is an active factor in the development of the North American continent, and will remain so as long as the policy of keeping the new country before the public is maintained by the Canadian Government, by railways and land companies. The immigration which has followed their campaign shows no sign of diminution. While, for commercial purposes, population in the Canadian West is not so valuable to us as population in the American West, it should not be considered that an imaginary boundary line can bar the currents of trade. A populous Canadian West is better for us than an uninhabited wild. It can scarcely be maintained that Canada's development is accompanied by any neglect of our own opportunities so long as a moving army of something like 400,000 homeseekers is occupying the unsettled portions of

our own West. Some may be spared to "Americanize" the grassy plains of Canada, and yet leave us a surplus for our own upbuilding.

LIBRARY GIFTS IN 1902-1903.

At the twenty-fifth annual meeting of the American Library Association, held last week at Niagara Falls, the customary report on gifts and bequests from June 1, 1902, to May 31, 1903, was presented by Mr. J. L. Harrison of the Providence Athenæum. From his statistical tables, which will be published in the *Library Journal*, many interesting inferences may be drawn by those who believe that library development is a rough index of the culture of a community. Naturally, the figures emphasize Mr. Carnegie's peculiar eminence as a giver of libraries. The year has seen 158 Carnegie libraries added to a list which has probably passed one thousand and increases with almost daily rapidity. In other words, Mr. Carnegie, in the year ending last May, provided three library buildings for every one furnished at the public expense or by private beneficence. Or, if one chooses to regard Mr. Carnegie's gifts from the point of view of expense, he has given during the year $6,679,000, out of total library gifts (excluding, however, 96,247 volumes) of $10,306,407. In fine, Mr. Carnegie contributes two-thirds of the money and three-quarters of the buildings.

Little new is to be said about this broadcast sowing of public libraries. The results are unquestionably mixed, and until one can be assured that there is a skilful librarian in each building and an enlightened board of directors in control, there will be reason to doubt if the educational value of these institutions justifies the expense. Yet the future will probably bear out not only Mr. Carnegie's liberality, but his faith in the value of the reading habit. For, in the long run, local boards will see the absurdity of buying dozens or scores of each worthless novel, and will cease to rival the excellent agencies which render this service at a reasonable cost.

The fear sometimes expressed that Mr. Carnegie's lavishness would discourage other givers and leave him with a monopoly of the library business, does not seem warranted by Mr. Harrison's figures. Public interest is measured not in dollars, but in gifts, large or small. Mr. Harrison enumerates all money gifts of $500 or over, and all gifts of not less than 250 books. By this rating, Massachusetts, with a total of eighty-five gifts to libraries, leads all the other States. Her five Carnegie libraries, to cost $65,000, form only a small fraction of gifts from other sources, amounting to more than $300,000; while it should be noted that Massachusetts is notably liberal in the expending of public funds for such purposes, and very rich in library endowments of long standing. Gifts of 18,591 books, a figure only surpassed by New York's 25,944, are a significant sign of the intimate interest that citizens of Massachusetts take in their libraries.

Pennsylvania leans heavily upon Mr. Carnegie, as is not unnatural. His gifts for the year amount to $3,105,000, of which nearly a half is for the enlargement of the Carnegie Institute at Pittsburgh. Other gifts are only a little more than $517,000. Only in the Middle West does the Carnegie habit tend to harden into an exclusive formula. Ohio (17), Indiana (14), Michigan (12), Wisconsin (13), Iowa (18) easily lead all the other States in their readiness to accept Mr. Carnegie's offer of library buildings. These are States which, as far as the gifts of the past year show, have a retarded library development. In every case, gifts from other quarters are but a small fraction of the Carnegie funds for buildings. But of these States, too, it should be said that they lack initiative rather than enterprise. Mr. Carnegie doubtless counts it an especial triumph for his propaganda when he loads scores of libraries upon the public funds in States that have naturally little interest in library matters. New Hampshire, Vermont, Rhode Island, Connecticut, Delaware, and Virginia have not drawn upon Mr. Carnegie, nor, except Rhode Island, have they received noteworthy gifts.

Measured on this scale, our own State makes a very creditable showing for the year. Mr. Carnegie, after his great gift of branch libraries in this city, has been in desuetude, with a mere nine buildings at a total cost of $139,000, while the list of gifts from other sources comes to $679,835 in money and 25,944 in books. This would probably entitle New York to second place after Massachusetts, whose primacy is proved quite as clearly in eighty-five gifts, against sixty-five for the Empire State, as in figures of dollars and cents.

These statistics of private gifts have a peculiar significance. They not only mean that a community is willing to support libraries, but they are also the indication of a public that aids in the proper management and use of libraries. That bureaucratized Washington should leave its library concerns to Congress and Mr. Carnegie is not surprising; that whole ranges of States in the South and West show only a handful of gifts to libraries, is evidence that besides public libraries many communities need training in the use of the facilities which, under the Carnegie dispensation, seem to come so easily. On this matter Mr. Churton Collins says some sensible things in the current *Nineteenth Century:*

"If philanthropists—I submit it with all respect—instead of continuing to assist in scattering these libraries broadcast over the country, would substitute some provision for rendering those already existing really efficient and beneficial, they would supply a want more urgent than their multiplication. And it is not difficult to specify what is needed; it has just been indicated—provision for enabling readers to know how profitably to avail themselves of the treasures placed at their disposal; provision for an adequate regular supply of the best books in leading subjects of study, and for securing the services of properly trained and properly qualified librarians."

That Mr. Carnegie realizes this truth is shown in his gift to Western Reserve University for a library training school.

MAZZINI REDIVIVUS.

FLORENCE, May 26, 1903.

Just a quarter of a century after Mazzini's death, his little book on 'The Duties of Man' has been introduced into the public schools of Italy by the present Minister of Public Instruction, Signor Nasi. Many attempts had been made (by Bertani first) to induce successive ministers to allow the work to circulate among the schools; but the fear of priestly clamor and the fact that the apostle of United Italy, though in homage to the principle of popular sovreignty he bowed to the plébiscites, and abstained from any attempt to transform monarchy into a republic by violent means, yet adhered to his convictions that the republic is the ideal government, prevented any minister hitherto from acceding to what was at one time a general desire on the part of liberals. The editorial committee for Mazzini's works, however, has in the course of twenty years published thirteen editions, reducing the price of the pamphlet to one halfpenny. The present minister has thought it necessary to slightly curtail or omit the paragraphs that exalt the republic, and to substitute for the author's dedication to workingmen (for whom the book was originally written, commencing in 1844, and reproduced in the *Roma del Popolo* 1871-2) a preface which affirms that the slight omissions do not alter the nature of the work. This affirmation is difficult to accept, because Mazzini believed that human progress could not be fully attained unless governments result from the free election of the people. A few notes summing up Italian liberties secured under the monarchial régime since Mazzini's death would have sufficed.

The omissions may find explanation at least in the violent attacks on the book's introduction into the schools made on all hands—by monarchists and republicans, but most especially by clericals and Socialists. The republicans, of course, object to the omissions, but also to the *Doveri* as "too theological," as "too dogmatic," "too mystical." They seem to forget that the schools are already inundated with Catholic, often Jesuitical, catechisms, and in certain schools text-books are used which excite openly to the abolition of Italian unity and to the restoration of the temporal power. The objections of the Catholics to the *Doveri* need not be enumerated. They are at least intelligible and logical; but the fury, the venom, the calumnious libels of the Socialists surpass all measure, and leave one with the impression that they are not so sure of their present influence and future triumph as they seemed to be some time since. Mazzini, who from 1833

affirmed that all political reformation which had not for its object the amelioration of the social condition of the masses was worthless, who foresaw in coöperation, in association, in the union of labor and capital, the real levers for the emancipation of the working classes from the position of salaried laborers—this long before coöperative societies or trade unions had assumed form and shape—is accused of always having been the "declared enemy of the proletary class." His religion, it is said, his God, his economical doctrines all tend to the maintenance of the classes against the masses, of the *borghesia*, of property individual and absolute. Further, because he was a believer in God, he is denounced as a bitter and implacable despiser and enemy of "the contemporary scientific movement—eminently positivist and naturalistic." Space does not allow quotations. Certain it is that this authorization of the 'Duties' in the schools has raised such a torrent of polemics as no other publication has given rise to since public schools have existed. And this is beneficial. Dr. Napoleone Colajanni, member of Parliament, republican, with advanced social views, first-class polemist, editor of the *Rivista Popolare*, has summed up the whole question in a pamphlet entitled 'Priests and Socialists against Mazzini,' with a delightful "tak it among ye" impartially. He not only gives a fair exposition of Mazzini's social doctrines, showing how from the first he opposed the economists of "supply and demand," the "buy in the cheapest, sell in the dearest market" school, and that he, long before Marx or Bakunin expounded their special theories, came nearer to a really practical collectivism than any of them have yet done.

Meantime the second volume of Mazzini's Correspondence is on the eve of publication. It is wholly devoted to the years 1835-6, after the failure of the Savoy expedition. Those years were assuredly the very saddest of his life, years of desertion by his followers and friends, of separation from the only woman (Giuditta Bellerio Sidoli) that he loved wholly, solely, as a true and noble man could love—a separation rendered doubly bitter by the fact that its object (her reunion with her children left in the custody of her father-in-law, a devout adherent of the Duke of Modena) was not attained. Worse still, all these material trials were deepened by the tempest of doubt which was gradually gathering in his soul, lest, after all, the idea of Italy reborn was only a chimæra of his imagination and not a "providential design" at all. His New Year's letter home indicates his state of heart: "This is the first day of 1835; am I to formulate wishes for you? What would be the use of my auguries? Some one came into my room this morning wishing me 'A happy New Year!' 'My dear,' I answered, 'let me wish you nothing for fear that the roof should crumble on your head. Neither will I wish anything for you; only I say with even more fervor than usual that I love you, that I have always loved you, that I shall love you to the end. In these words are all my New Year's greetings, as in them lies my whole existence. Happy I can never be, whatever direction men and things may take, but happy in the peace and happiness of others—that I yet can be!"

On the 10th of January Mazzini has removed to Berne with Giovanni Ruffini, but hopes soon to return "to his mountains and his rocks," where the cold that his mother so fears has no terrors for him—she has brought him up too hardily for him "to swaddle himself in flannel now; besides, in Switzerland they have fires, which in Genoa are unknown." The Federal Directory which remained in charge as long as the Diet was not sitting, "is not badly disposed, but allows itself to be too much influenced by the French Ambassador, M. de Rumigny." Mazzini and the Italian exiles in general had ceased, of course, to hope for any help from Louis Philippe and his *juste milieu* Ministers, who had banished all exiles from France; but they were not yet aware of the deliberate determination of the entire French Government to compel Switzerland also to banish all from her territory. They hoped for a little peace as long as they kept quiet and did not interfere with Swiss affairs; but their hopes were shortlived. As long as Mazzini was in Switzerland, Louis Philippe had no rest. Austria was no less importunate, Metternich threatening to "withdraw her ambassador," and alleging, but this was natural, that Mazzini's persistence in remaining so near to Italy had no other object than to prepare the Italians for a crusade against that "foreign intruder." He has written for the French *Revue Républicaine* an article on "The European Initiative," which he tells his mother she will not be able to read, as the review is not allowed to circulate in Piedmont.

"For a year past I have expressed my opinion that the mission of France is finished. France has done much for Europe, and one people cannot do everything. It is well that this is so, or it would necessarily become a 'tyrant people.' But of this change the French will not admit the truth: their pride increases in the same measure as its foundations diminish. If you could read their newspapers! Whenever France itself is the subject, they do not refrain from speaking of things as they are—lamenting, cursing the apathy, inertia, and immorality everywhere prevalent. But as soon as another nation is the subject, then only to France must it look for salvation; the progress of all other nations depends on that of France alone."

He keeps himself up to date in English politics, though he hopes nothing from the English Government for oppressed nationalities. Great hopes arise on the death of the Austrian Emperor Francis I. (March 2, 1835). Mazzini hopes for nothing, "seeing that Austrian policy is centred in Metternich, and though the young successor hates him, he must adhere to his policy, as any attempt at conciliation would be interpreted as a sign of weakness and lead to immediate revolt, already attempted in Transylvania." Meanwhile Metternich threatens to "exterminate Berne." Mazzini and Giovanni Ruffini go to Grenchen, telling only his mother of the flitting, and, when arrived there, taking up the "thread of his discourse" on books and European politics, as though the removal had been voluntary, just from one house to another. Meanwhile, search is being made for him everywhere, and he has to remain hidden so as to leave the French police with their conviction that, if he is not at Belleville, near Paris, he is certainly in the vicinity. He hardly ventures to go out for a breath of fresh air during the stifling summer months late at night, and that rarely. "The Powers demand that the Swiss Diet reintroduce the old laws fettering the press, and that they abolish the right of asylum." Bombelles, the Austrian Ambassador, has quitted Berne, declaring that he will not return until Mazzini is expelled. "And nothing will persuade them that at Berne I am not!"

The cholera invades Italy—Piedmont, then Genoa—and he hears that it is making ravages in Rome, where his Giuditta is still. He is tortured with anxiety, and prays his mother to keep him exactly informed. She tells him of the extraordinary exertions of his father, the courage that he infuses into his brother physicians; how with five of these he had visited the Hospital of Carinano, and, having obtained permission from the Governor of Genoa to use his own judgment, unfettered by the prescriptions in vogue, which forbade the physicians to touch the patients for fear of infection, he had treated them as he believed best, felt their pulses, passed his hands over their persons, and pronounced that two were suffering from nervous fever, other three from inflammation, none attacked with Asiatic cholera. Thus he infused courage among the families who hitherto had fled, leaving their sick untended and uncared for. The mother of the Ruffinis bears witness to his courage and success. The son is "proud and glad, but not surprised." But the real cholera ravaged Genoa throughout 1835-6, and Dr. Mazzini continued his unostentatious and successful crusade.

These letters, as the 'New Memorials and Letters of Jane Welsh Carlyle' do for her much-maligned husband, show what manner of man was Mazzini's father, and leave one with a sad sense of the injustice of fate and biographers, and special remorses for one's own share in the misjudgment of a man who lived out his whole life for others—his son's career forming his sole ambition. This cut short forever in 1830, he worked as professor at the university until 1844, then continued his profession as physician far too long for his strength, so as to maintain his son in exile, and died in 1848 without ever again beholding him or even living to see his ideas triumph, for a time at least, at Rome in 1849. One other mistake these letters correct. In the *Nation* of February 24, 1898, deceived by Cagnacci's mistake in confounding the many aliases of Mazzini, I referred to a drama entitled "Alessandro Medici" as written by Mazzini and much praised by the Ruffinis. The author was, instead, Antonio Ghiglione, an erratic and not very reputable exile, who committed certain acts of indelicacy which have been attributed to Mazzini by outsiders. Of this drama Mazzini speaks highly in his letters home, and we hear of one later entitled "Anna."

Mazzini is disgusted with Fieschi's attempt to assassinate Louis Philippe, as with all similar attempts. "If the birth of a republic depends on the death of an individual, what is a republic worth?" He foresees that it will strengthen the king's arbitrary power, and in fact the law restricting the press and public meetings was the chief result, with renewed persecution of the exiles. He visits the island of St. Pierre, on the Lake of Bienne, where once Rousseau took refuge. "The room in which he lived is bare, squalid, with two or three straw chairs—a room such as Chatterton died in. Genius allied to poverty produced a strange impression upon me,

though I did not manifest what I felt to my Swiss companions. I did not expect to be impressed, for, though I look upon Rousseau as a powerful writer, I do not sympathize with him wholly as I do with Byron and one other [probably Schiller]." At Rome there has been a perquisition in Giuditta's apartment, it being believed that a certain person "was travelling in Italy."

Mazzini gives a charming description of the Swiss family with whom he lives:

"One of the articles of our politico-religious creed is the abolition of domestic service, the regeneration of the class of so-called servants—a class which, like all enslaved people, like the Jews and other classes which the present organization of society deprives of human rights, has of necessity become bad, selfish, without affection for, nay hostile to, the class of masters. If you want to regenerate an individual, emancipate him; make him your equal, give him consciousness of himself. Here we are served at table by the daughters of the house; they clean our rooms and light our fires; but we live on terms of equality, and we are loved as well as served."

For an entire year the exiles were left in peace at Grenchen; then, their refuge discovered, the French police got up a story that a meeting of refugees was to be held there to concert an invasion of the Badenese territory. The baths were invaded by 200 Swiss gendarmes. The house was searched, but of course neither visitors, nor arms, nor compromising papers were found; but the authorities of Soleure, under orders from the ambassadors, arrested Mazzini and Ruffini and took them to the prison of Soleure, where the inhabitants raised such a clamor that they were forced to release them. But, for fear of damaging their kind hosts, the exiles resolved on leaving their refuge, were welcomed by a Protestant pastor at Langenau; from this place (which we find on no map) Mazzini writes to his mother on June 2, making light of the trouble, which was indeed a grievous one. Then follow a number of letters without any address. Meanwhile the Swiss Government, to satisfy the "ambassadors," violates the right of the press, arrests all the directors, writers, printers, and compositors. One hope remains, that they may be received as citizens of the Canton of Soleure, and the birth certificates are asked for and forwarded. "Now for the first time," writes Mazzini, "I know when I was born." His letters are more cheerful than usual, but the iron had entered his soul. The Ruffinis could not stand the close confinement; moreover, they had long shown their total disbelief in any further sacrifice.. "Italy was unredeemable save by providence or fate." The Canton of Soleure was prevented by the Diet from granting them citizenship. Then followed six months more of literal hiding. They cannot even give their address, save orally to one faithful friend in a far-off canton, who receives and sends letters to and from Genoa. Mazzini's hour of Gethsemane had come—an hour, or rather days and weeks, of black despair, which really brought him to the border of insanity, though he revealed his state to no human being. Then, yielding more to the Ruffinis than to his own desire, he accepted the offer of the English Ambassador to procure them passports and a safe conduct through France, and in January arrived homeless and almost friendless on the hospitable, but "gloomy, sunless, musicless" shores of England.

J. W. M.

TITIAN'S SACRED AND PROFANE LOVE.

ROME, June, 1903.

Few paintings have been so universally known and admired as Titian's so-called "Sacred and Profane Love" of the Borghese Gallery in Rome. For four centuries the world has admired this marvellous canvas, captivated by the exquisite harmony of its colors, the beauty of its figures, its delicate flesh tints, its wonderful coördination of light and shade, the freshness of its spring landscape. But the world has paid its tribute of admiration without knowing the subject of the design. True, it has borne various titles at various epochs—the first that we know, "Beauty Adorned and Unadorned"; then, "Heavenly and Earthly Love," "Artless and Sated Love," "Innocence and Experience," and finally that by which it is commonly known to-day, "Sacred and Profane Love." But certainly not one of these titles answers to the truth, not one of the allegories succeeds in explaining the composition of the Borghese masterpiece. What is, then, its subject?

Let us try by careful study to answer the question, asking those two female figures their meaning, examining the expression of their faces, seeking light from the symbols and attributes which accompany them. The nude figure at the right has the semblance of a Venus. All art critics, from those of the seventeenth century, who saw in her the embodiment of Beauty, to Lübke and Cavalcaselle, who believed her that of Love, all have considered her a Venus. And if her beauty, if the splendor of her nude form, do not express this conception, it is certainly shown by the little censer, the Cytherean symbol, which she raises with her left hand, and by the presence of her little son, Cupid. Furthermore, the whole picture breathes love; all seems to form a crown for the Goddess of Love, from the butterflies which beat their wings and pursue one another in the air, to the amorous peasants who embrace in the distance, the rabbits which crouch close to one another, the springtime, and the bewitching hour when the sun casts his last rays upon the earth.

Venus is certainly in the act of speaking. Turned toward the other woman so as to show her profile, she enforces her words with her uplifted arm, and, looking fixedly at her companion, seems to wish to persuade her. The other, seated upon the opposite edge of the fountain, looks instead before her into space, like one who thinks and hesitates. Evidently she does not hear with pleasure the words of Venus, toward whom she does not turn her face as would be natural. Rather she turns from her. Is she another goddess of Olympus? No. If we seek her in the statues, bas-reliefs, pictures, in the mythological literature of the Greeks and Romans, we shall find no goddess so richly attired, none carrying under her right arm a box, basket, jewel-casket, or whatever it may be, and in the left hand a small green branch. These attributes of the woman are unmistakable. Her principal characteristics are beauty, youth, and splendid attire. It is easy with the assistance of so many and so rare indications to recognize Medea. Richly attired and with a little branch in her hand, seated in a balcony with Eros near, she is to be seen in vase No. 2,413 of the Museum of Naples. Richly attired, we see her again in vase No. 377 of the Caputi collection at Ruvo, where she is also in company with Cupid, a basket in her left hand. The same figure recurs in many other vases, among them that of the British Museum reproduced in Roscher's well-known 'Dictionary of Greek and Roman Mythology,' and that of the Lateran bas-relief No. 278, *Sala* IV, where Medea is in the act of opening the box of magic charms. In literature, too, Medea is represented with the Greek φωριαμός or the Roman *arca*, and with the potent little branch in her hand, the branch "immortale virens," as Valerius Flaccus says.

Now if, as seems to us certain, the three principal figures of the picture are Medea, Cupid, and Venus, what myth does Titian wish to immortalize upon canvas? Any dictionary of mythology will give it. It forms one of the best-known episodes of the 'Argonautica' of Valerius Flaccus and of the 'Metamorphoses' of Ovid. Venus appears to Medea and urges her to follow Jason and save him. Medea at first indignantly repels the proposition, which offends in her at once the virgin, the daughter and the queen. The seductive arguments of the Goddess of Love, however, lead her to forget father and country and duty, supplanting all with a burning love for Jason, who will die unless aided by her magic charms. She decides to follow Venus: "Te ducente sequor." But before setting out, not content with her poisons—"nec notis stabat contenta venenis"—she girds her belt, and takes the portentous, never-fading herbs, then goes to overtake Jason in the wood near by. This, briefly told, is the myth which has so numerous illustrations in Greek and Roman literature, and it was from literature rather than from art, we must believe, that Titian received the inspiration for the Borghese picture, in which he seems to have wished above all to illustrate the famous words of Medea, when, after a fiery struggle between duty and love, she decides to follow Jason and exclaims:

"Video meliora proboque,
Deteriora sequor."

Documents contemporary with the picture, which would indicate its subject, are as yet unknown; but that the subject should be sought in mythology, given the spirit of the profane pictures of Titian and of his contemporaries, seems to us beyond doubt.

But perhaps there is some authentic document which will offer further proof that this myth which we have cited is the subject of our canvas. In an article in the *Frankfurter Zeitung* (February 4, 1902) it is stated that an edition of the 'Argonautica' of Valerius Flaccus exists, printed in Paris in 1550, which reproduces as its frontispiece the Borghese picture with the inscription, "Venus Persuading Medea to Fly with Jason." Certainly, the editor might most appropriately have chosen Titian's picture as an illustration, since the love of Medea and Jason is one of the principal episodes of the poem. But does this edition really exist? Researches which I have made myself in several of the most important libraries of Germany, such as those of Heidelberg, Strassburg, and Mu-

nich, in which are to be found almost all the editions of the 'Argonautica,' have proved fruitless, as have also my researches in the leading libraries of Italy and the Bibliothèque Nationale of Paris. Furthermore, no bibliography mentions an edition of Valerius Flaccus printed in Paris in 1550. In the other editions of the sixteenth and seventeenth centuries which I have examined, no engraving of our picture appears. From this I would conclude, not that the citation is false, but that it is inaccurate.

In 1895, Wickhoff, in an article upon Giorgione, speaking incidentally of the 'Argonautica' which inspired Zorzi da Castelfranco with one of his pictures, states that the account of Venus and Medea contained in Book vii. suggested to Titian the theme for the Borghese canvas. Wickhoff, who does not stop to demonstrate his assertion, is followed in his new interpretation by both Lionel Cust and Claude Phillips. Again, the *Frankfurter Zeitung* (February 25) published an article upon the same canvas in support of its earlier assertions, always arguing from the reproduction of the picture in the edition of the 'Argonautica' of 1550, with its explanatory inscription.

Among the reproductions in the "Masterpieces of Painting" executed by Callway of Munich, our picture is also to be found, and I have observed with surprise that it does not bear the usual title, "Sacred and Profane Love," but "Ueberredung zur Liebe." In brief notes, printed inside the cover, the critic remarks that, after four hundred years, the subject of this masterpiece is not understood, but he goes on to say that in the nude woman must be recognized Dame Venus herself ("Frau Venus selber"), "who speaks in a seductive manner to the haughty woman, whose pride quickly disappears as the goddess aproaches her"; and he concludes, "It might be possible to give the work the title, 'Incitement to Love.'" The German critic, therefore, without thinking of the myth, but merely from observation, has recognized Venus in the nude woman, and, what is more important, Venus who, with seductive words, incites her companion to love. This is an indirect proof, but it goes to confirm our interpretation.

Other questions now suggest themselves, of which one is most important: For whom was this myth of Medea painted? Unfortunately, no documents are known which can aid us in replying, and the only thread of evidence which can lead us to the discovery of Titian's patron in the present case is the coat of arms painted upon the fountain. I have been fortunate enough to find it in a manuscript volume of heraldry, reproduced exactly, under the name of the Aurelio family. Nothing else is stated in the manuscript, not even the city to which this family belonged. But from researches which I have just now commenced, I hope that the name will give us some light. The noble family "Aurelio" originated in Aquileja, passed to Padua, and from there went on to Rialto, where its principal branch became extinct in 1207 with Giovanni Aurelio, *provveditore dei riti*. However, in the orders of Venetian citizens we find one noble and prominent personage, Nicolò Aurelio, who in 1523 was Grand Chancellor of Venice. It would be useless now to hazard speculations, but I hope that a continuation of these researches will lead later to the discovery of the name of the patron who ordered Titian's famous picture, and of its date, and will enable us to discover the vagaries by which it arrived in the gallery in Rome. For the present, we must be content to restore its true title to the famous masterpiece, to which four centuries have paid profound admiration, although ignorant of its subject, "Venus Persuading Medea to Follow Jason."

UMBERTO GNOLI.

Notes.

Paul Elder & Co. (lately Elder & Shepard), San Francisco, have in preparation 'The Voice of the Scholar, and Other Addresses,' by President Jordan of Leland Stanford Junior University; 'Poems of Ralph E. Gibbs,' a memorial volume edited by Prof. Charles Mills Gayley; and 'Antigone,' an account of this play's performance at Stanford, with illustrations.

A. C. McClurg & Co., Chicago, will publish 'Poe's Best Tales' and 'Poe's Best Poems and Essays' in two volumes, edited by Sherwin Cody.

A new popular edition of Thackeray in twenty-five volumes is announced by Harper & Bros., with the familiar illustrations.

Macmillan Co. will publish in the autumn 'Select Statutes and Other Documents Illustrative of the History of the United States, 1861-1898,' edited by Prof. William MacDonald.

'Studies in Human Nature,' by Prof. Élie Metchnikoff, will be immediately brought out by G. P. Putnam's Sons, with an introduction by Dr. P. Chalmers Mitchell.

The Oxford University Press (New York: H. Frowde) will issue at once 'Sacred Sites of the Gospels,' by Dr. W. Sanday, canon of Christ Church, with special illustrations, maps, and plans.

J. F. Taylor & Co.'s "Library Edition" of Charles Kingsley's Novels and Poems proceeds with 'Alton Locke' in two volumes, containing Thomas Hughes's long prefatory memoir. So the "Fireside Dickens" of Chapman & Hall (New York: H. Frowde) adds 'Barnaby Rudge,' the Christmas Books and 'Child's History of England' to that series, with the elder illustrations. Mr. John Lane's pocket Trollope arrives at 'Framley Parsonage'—plain and modest volumes in a fair type. Of like description is his George Eliot's 'Silas Marner.'

Mr. Newnes's attractive Caxton thin-paper editions—the paper a shade too thin and transparent in the present instance—take in Evelyn's Diary, and the 800 pages bulk only about three-quarters of an inch in thickness.

The "Centenary Edition" of Emerson's writings has for its third volume the 'Essays: Second Series,' originally published in 1844, when Dr. Hedge ventured to prophesy that they would "carry far into coming time their lofty cheer." The likelihood of their doing so is greater now than then. The notes in this volume are as interesting and important as in the two preceding. The introductory note to "Experience" relates that baffling essay to "one of the critical epochs of Mr. Emerson's life," when "the old and the new were contending within him" and "he was severely tried." The impression given of Emerson's moral agitation is a novel one, but, unfortunately, no date is mentioned. What some have suspected is confirmed by a note, quoting Emerson's journal, which assures us that George Ripley and Brook Farm were intended where we read (p. 101), "I knew an amiable and accomplished person who undertook a practical reform, yet I was never able to find in him the enterprise of love he took in hand." We have a good example of Emerson's sincerity where, using in East Lexington some pages from an earlier sermon, he said, "I do not now believe what I have just read." Yet in one sense he was "a two-faced man," as the sculptors French and Morse, modelling his face, discovered; one side presenting the philosopher, the other the friendly and domestic man.

Accounts of events of more than local importance prepared with thorough local knowledge are always pleasing and valuable. Among the best of recent books of this class is to be reckoned Mr. Frank H. Severance's 'Old Trails on the Niagara Frontier' (Cleveland: The Burrows Brothers Co.), which has now reached a second edition. The author's undertaking—"to illustrate," by a series of monographs, "certain typical and well-defined periods in the history of the Niagara region"—is excellently performed. "The Cross-Bearers," "With Bolton at Fort Niagara," "Underground Trails" (the crossing of the border by fugitive slaves), "Niagara and the Poets," are among the more important titles. The scholarship, accuracy, and local knowledge shown in the treatment of these events described give the book more than a parochial interest. Of no slight value as contributions to history are the account of the early Jesuits' visits to this region, to which fathers of the Huron Mission came as early as 1626, and the story of Fort Niagara during the Revolution, when it was the headquarters of the Tory and Seneca operations against the New York frontier.

Franklin College was opened at Lancaster in 1787, in the interest of the German settlers of Pennsylvania, the educational opportunities of whose children had been very poor. Its obligations to its patrons of English blood (prominent among whom were Franklin, Morris, Rush, Mifflin, and MacKean) were repaid later by its becoming an interpreter of German thought and learning, and a medium whereby these came into contact with American life. This was especially the function of Marshall College, which was founded at Mercersburg in 1836; the two were united at Lancaster in 1853. Though not among our larger institutions, Franklin and Marshall is something more than the chief school of the (German) Reformed Church. It has always stood for the traditions of culture and for conservatism in college life, with a marked preference for "the humanities" above the sciences. It has a highly logical course in metaphysics, and the requirements for its post-graduate degrees are unusually severe. Located in an interior town, away from the larger expenses and excitements of great centres, it has aimed to maintain unworldly standards of plain living and high thinking. While smaller concerns are calling themselves universities, it has been content with its own sphere, as preparatory to that of the (ideal) university. These facts should impart more than local interest to the 'History' of this college, compiled by Dr. Joseph H. Dubbs, and published at Lancaster by the Alumni Association. It is a

sizable octavo, unpretentiously written and liberally illustrated.

Miss Somerville and Miss Martin of Ross, the authors of the 'Experiences of an Irish R. M.,' achieved an instant success even with readers whose notions of Irish life are derived from an hour's stay in Cork harbor or at most a trip to Killarney. Their latest volume, 'All on the Irish Shore' (Longmans), is in the same vein: a series of amusing and absolutely faithful sketches of Ireland as she is, with her continual "soft" weather, her slovenliness, her salmon-fishing and fox-hunting, her atmosphere of petty sessions and horse-dealing—all the elements that lend a charm to life in the south and west of Ireland, where one meets the most complete ignorance of the indoor arts, the most perfect absorption in and mastery of life out of doors. These writers practise an admirable parsimony of dialect, using it only for occasional ornament—a method that we commend to the New England "salt-water sketch" school. The tragedy that underlies so much of Irish life is still (in spite of Mr. Moore's last volume) an unworked vein, but the everyday country life of the remoter counties of Ireland could hardly be chronicled with more humor or greater sureness of touch than in these sketches.

The Hakluyt Society, by its latest publication, 'The Portuguese Expedition to Abyssinia in 1541-1543' (Series II., vol. x), has revived a long-forgotten but most heroic episode in African history. To a Portuguese fleet anchored off Massowa in 1541 came tidings from "Prester John" that "his kingdoms had been for fourteen years occupied by the Moors, and that the main of his people were in captivity," and beseeching aid. A council was held of the captains and "fidalgos," and "they agreed that it would be to the service of God and his Highness to send them help in their great necessity." Four hundred men under the command of Christopher da Gama, son of the great navigator, marched into the interior, and, after varied fortunes and the loss of the greater part of their number, including their leader, finally drove out the Moors. Thanks to their prowess, Abyssinia remained Christian. Two narratives by members of the expedition are given, the longest and most trustworthy being that of Miguel de Castanhoso. The other is by a monk, D. João Bermudez, who claimed to be the patriarch or head of the Abyssinian Church. In both are numerous instances of the credulity and exaggeration which characterized those who wrote of strange lands at that time. They both relate that the Apostle St. James rode "on a white horse in front of the army, armed with all arms, and carrying himself proudly, . . . and wrought great destruction" among their enemies. When Da Gama's head was cut off and fell to the ground, "a fountain of running water gushed out, which had never been seen before; its water, through the goodness and power of God, gives sight to the blind, and cures those ill of other diseases." The translator and editor of the narratives, which now appear for the first time in full in English, is Mr. R. S. Whiteway. An introduction, also by him, furnishes much information in regard to the history of Abyssinia. A map and a very complete bibliography, containing some 500 titles, of works concerning Abyssinia—by Mr. Coulsby of the British Museum, and Hon. Secretary of the Society—add to the value of the work.

The fore matter of the 'Switzerland' in "Macmillan's Guides" testifies to the superior character of the work. The editor aims to convey, in a few brief, but not dry sections, a notion of the country and its people, and to furnish a motive for taking an interest in both. This is followed by the ordinary hints to travellers, with a survey of baths and springs, of glaciers, and glacial origins, and of avalanches. Next comes a list of hotels, with an indication of those frequented by English and Americans, and of charges. After these hundred pages the routes for tourists; with maps made in Switzerland whose "quality is certainly unsurpassed" in rival guide-books —a not unworthy claim. "Switzerland" is also liberally interpreted so as to warrant inclusion of neighbor lands physically allied to it—*e. g.*, the lake country of northern Italy.

The Saxon Switzerland is treated in the latest issue of Velhagen & Klasing's "Land und Leute" series (New York: Lemcke & Buechner), in the original title, 'Dresden und die Sächsische Schweiz.' The extraordinary natural features of this mountainous region are beautifully displayed in half-tones, along with equally fine views of the Saxon capital, of Meissen, and other places within the scope of the work. There are two indexes.

We had occasion, a few months ago, to mention in these columns a Dano-Norwegian Etymological Dictionary now in course of publication in Christiania, and to call attention at the same time to the very serious lack of a Danish or Dano-Norwegian dictionary that should be to that public what the Standard or the Century Dictionary is to the American. The standard or rather only dictionary of the Danish language was, up to the present time, Molbech's 'Ordbog,' which in 1859 appeared in its second edition, and for many years has been out of print. Molbech's old publishers, the Gyldendalske Boghandel in Copenhagen, are now sending out a new 'Danish Dictionary for the People,' which, within a rather limited compass (about 800 large two-column octavo pages), purports to give all the Danish words occurring in regular present-day speech and writing, as well as the more common words of foreign origin, while foreign words of exclusively technical use are to be omitted. Of each word the origin and derivation are given, as far as possible. The first two parts (pp. 1-64), carrying the Dictionary to the middle of the letter B, have appeared and permit a judgment of the manner in which the work is being done. The completeness seems, so far, to be very satisfactory, the etymologies up to date, although perhaps too strongly influenced by the above-mentioned etymological dictionary; but the strictness of the definitions leaves much to be desired. We quote as an example the definition of the Danish word for *oar:* "A long pole, one end of which is flat, and which is used to row with." This lack of precision is particularly prominent in the zoölogical and botanical names—*e. g.*, the definition of the Danish word for English *auk:* "A kind of sea-fowl." This, to be sure, is an extreme case of unsatisfactory statement, but not in a single instance is the exact scientific name given. The authors of the dictionary are Messrs. B. T. Dahl and H. Hammer.

The first number of the new quarterly *Modern Philology* (The University of Chicago Press) sets a difficult standard for its successors. Philology in the severer sense is represented in such papers as Mr. Henry Bradley's "The Intrusive Nasal in Nightingale," in Dr. Ford's "Old Spanish Etymologies," and in Dr. Hempl's account of Hickes's bedevilment of the Anglo-Saxon Runic Poem; but most of the articles are devoted to what laymen call literary history. Notable are Professor Kittredge's discovery of a source for Chaucer's Prologue to the "Legende of Good Women" in certain poems of Eustace Deschamps, and Professor Emerson's identification of the "text" (in the Decretals) which states that "hunters ben not holy men." To the drama fall three papers, all valuable—"Some Features of the Supernatural as Represented in Plays of the Reigns of Elizabeth and James," by Professor Schelling; "The Mediæval Drama," by Prof. Brander Matthews, and "The Influence of Theatrical Conditions upon Shakspere," by Prof. E. E. Hall—a lucid and entertaining paper.

Though the connection between the structure of kites and geographical research is remote, many besides the students of the problem of aerial locomotion will welcome Dr. Alexander G. Bell's paper on this subject to which the June number of the *National Geographic Magazine* is devoted. It was originally a communication made at a recent meeting of the National Academy of Sciences, and is intended simply to call attention to the importance of the tetrahedral principle in kite construction. From experiments carried on during the past four years he is convinced that "tetrahedral kites combine in a marked degree the qualities of strength, lightness, and steady flight." The paper is illustrated by about a hundred diagrams and photographs with explanatory notes by Dr. Bell. It is announced that, at Mr. William Ziegler's invitation, the National Geographic Society will direct the scientific work of the north-polar expedition equipped at his expense which has just sailed for Franz-Josef Land, where it is to winter. The chief of scientific staff and second in command is William J. Peters, one of the Alaska explorers of the United States Geological Survey. His principal lines of research will be the determination of gravity, observations of the tides, the magnetic elements, aurora, the height, drift, and velocity of clouds, and the sea depth. The commanding officer of the *America* is Anthony Fiala, of Brooklyn.

The principal contents of *Petermann's Mitteilungen*, number four, are a study of the Alpine glacial conditions from the beginning of the ice age to the present time, the geologic changes of the southwestern Baltic coast region and its settlement by prehistoric man, and some notes on the industries of the Yap islanders. Among these is the catching of flying fish by torchlight. The fishing lasts for 100 days, during which the men are forbidden all intercourse with women; they refrain from certain kinds of food, and can neither cross a brook nor climb a hill.

Germany, as usual, occupies the most space in the current Consular Reports. The continued vigorous increase of her transportation facilities, notwithstanding the business depression of the past two years,

her fuel briquette industry, which is assuming great proportions, and her system of primary commercial education are among the subjects treated. The seriousness with which the education of clerks is regarded is illustrated by the rule in force in one school, "Apprentices are absolutely forbidden to attend dances or to take dancing lessons." The new tariff of Persia, which went into operation on February 14, is given, and there is a short description of the Corinthian Canal, completed in 1893. From its poor location it is practically a failure. With walls 260 feet high and a width of only eighty feet, it is like a huge airshaft, and foreign vessels at least do not dare to encounter the mighty gusts of wind which rush through it. Our Consul-General at Montreal contributes a long list of American investments in Canada in the four months preceding last April.

—With nothing sensational in its table of contents, the *Harvard Graduates' Magazine* for June will be found one of the most impressive numbers of this unique periodical. Here one can feel the very pulse of the great educational machine, whether in the tables showing "What it costs to run Harvard University," with the several apportionments for ten years, or in the exhibition of the working of the elective system, as deduced from the programme of studies of 448 members of the class of 1901, or in the numerous evidences of material and spiritual growth—the new lecture hall, the projected concert hall and Emerson Hall, the projected fireproof stadium. Here, too, will be found the whole law of hoods and gowns; the beginnings of new customs, like the picnic of the graduating class or the various festivities contrived for class reunions at Commencement. Among the statistics we select, from those relating to the class of 1901, already referred to, the following—that, of 372 who took the A.B. degree with all the requirements, 254 took no physics, 250 no mathematics, 247 no Greek, 215 no chemistry, 178 no Latin, 147 no fine arts, 140 no philosophy, 137 neither Greek nor Latin, 87 neither Latin nor mathematics, 29 no science of any kind, 8 neither physics nor chemistry, 60 neither botany, zoölogy, mineralogy, nor hygiene. Radcliffe announces the first deaths among its women graduates, of whom the entire 415 were intact up to December, 1901—a remarkable vitality. We might go on without exhausting the subject. Even the dry records of the Corporation, with item after item of benefaction to the living and memorial to the dead, we have found affecting reading.

—The July *Century* presents the first instalment of a really important addition to the correspondence of Sir Walter Scott. In 1806 he became acquainted with Mary Ann Watts Hughes, the grandmother of Thomas Hughes, and a year or two later began with her a correspondence which continued until 1831. The editor of the letters, Horace G. Hutchinson, assumes that the correspondence went on without interruption from 1813 to 1821, and that the letters covering these seven years were not preserved. The first letter after this break contains a reiteration of the famous denial of his authorship of the Waverley novels, and Mr. Hutchinson surmises that we owe to her suspicion of the real situation the preservation of all his letters from that date to the end. An interesting sketch of Mrs. Hughes is contributed by her only living grandson, William Hastings Hughes, of Milton, Mass. The two-hundredth anniversary of the birth of John Wesley gives occasion for a careful sketch of the life of the founder of Methodism from the pen of Prof. C. T. Winchester, of Wesleyan University. The present discussion of "race suicide" is sharply recalled by contrast when we are reminded that Wesley's gentle mother was the twenty-fifth child of Dr. Annesley, and that she herself was the mother of nineteen children. Professor Winchester suggests that it would be truer to say that Methodism had its origin in Susanna Wesley's nursery than in the University of Oxford, as is often said. To her domestic regularity, at any rate, her son owned his order and precision, his gift of organization and mastery of details. Wesley's appeal to the middle and lower classes, rather than to the aristocracy, the writer attributes to "the sure instinct of the philanthropist." Professor Winchester's paper is divided, the second half to appear in August. Dr. William Hayes Ward writes of the great archæological discovery in the code of Hammurabi, the founder of Babylon, "the most important document for the history of civilization that has been discovered in many years."

—Alfred Hodder's 'A Fight for the City' (Macmillan) is mainly devoted to Mr. Jerome and the campaign of two years ago, in which he played so prominent a part. The matters discussed have been gone over and over again in the political columns of the newspapers, but they look somewhat differently as discussed in this volume. One interesting point which Mr. Hodder brings out (and it is one which is always in danger of being forgotten) is, that while Mr. Jerome's outspoken campaign probably pulled the ticket through—he was the "star" speaker, at any rate, and the vote polled for him showed what a hold he had on the masses—his outspokenness caused the greatest terror in his own camp; had the managers dared, he would probably have been muzzled. What they dreaded was that the campaign should be made "personal"; what they wanted discussed was "issues." Now, as Mr. Hodder remarks, there are no political issues between Tammany and the community. Tammany is a sort of tyranny by which an organization of thieves, pimps, blackmailers, and other criminals, with a strong ruffian at their head, manage public affairs for their own private profit, under democratic forms; and a campaign against it is not a political campaign, in any proper sense of the word, but more like a pursuit of criminals, caught red-handed, by a sheriff with a posse comitatus. We want their trail pointed out that we may run them down, not arguments showing the advantages of honesty and law and order over crime and oppression and blackmail. Such abuses as we have to extirpate now—the revolting pictures of them given here would have been incredible a generation ago—cut so deep that nothing short of the means of attack employed by Mr. Jerome are of any avail. Why, then, do our solid men always dread them, and cry "Hush, hush" whenever they are resorted to? No doubt because our solid men are implicated in the guilt which is to be unearthed. They have had favors, they have had exemptions, they have profited by Tammany, while the poor and friendless have been ground to the earth. When Jerome begins to speak they all begin to quake. In Tweed's time and in Croker's time their quaking, their desire for "issues" and dread of personalities, was a sign that we were on the right track.

—In his 'Shakspere and the Rival Poet' (John Lane), Mr. Arthur Acheson of Chicago has added one more to the innumerable attempts which have been made to pluck out the heart of the mystery which Shakspere has enshrined in his sonnets. In so far as Mr. Acheson's work represents a reaction from Mr. Sidney Lee's interpretation of these famous poems (as almost wholly conventional exercises in a metrical form which was the fashion of the day), many readers will be in sympathy with him; but one cannot help being somewhat startled in the discussion of so thorny a subject to come across the following statement: "In the twentieth and twenty-first sonnets I have found a clue which not only leads to a full identification of Chapman as the 'rival poet,' but gives us also a settled date for those two sonnets which enables us to work out dates for the production of the whole of the remainder of the series and, incidentally, for several of the plays." The suggestion that Chapman was "the rival poet" of course originated with Professor Minto; but the clue here in question turns out to be the poem by Chapman called "The Amorous Zodiac," and it is against this poem, according to Mr. Acheson, that Shakspere vents his sarcasm in the twenty-first sonnet. As a matter of fact, the poem would come very well within the scope of Shakspere's criticism (which, after all, strikes us as not very seriously meant), but so would many another of the Elizabethan time, when surely no one poet had the monopoly of comparing his mistress with "all things rare that heaven's air in this huge rondure hems." The general language of Shakspere's sonnet would, indeed, seem to accord better with a poem of less exact and definite structure than the "Amorous Zodiac," with its elaboration of one distinct though far-fetched image. There are things in the book a good deal more extravagant than this, but in the main the value of it depends on the theory of the connection between these two poems. For our own part, we should feel no hesitation in rejecting that theory.

—By a singular omission, no biography of Isabella d'Este has appeared until now, when Julia Cartwright (Mrs. Ady) publishes a life of this celebrated princess in two volumes (Dutton). It will be remembered that the same author has written an excellent book on Beatrice d'Este, the sister of Isabella and Duchess of Milan in the days of Lodovico Moro. These sisters share with Elizabeth Gonzaga and Vittoria Colonna the fame of having been the most unusual and attractive princesses whom Italy could boast during the heyday of the Renaissance. Of the four, Isabella d'Este was the most successful in the eye of the world, and also in her own right by virtue of gifts and training the most brilliant. For many years during the first half of the sixteenth century she was the ruling power at Mantua, through the influence which she possessed over her husband and her son. Thus placed at the head of an important court, she enjoyed a remarkable opportunity to show her taste in literature and art,

Guarino had been her tutor, and Ariosto sang her praises. Mantegna lived at her court, and she made her Studio of the Grotta the home of a collection which was hardly to be equalled in Italy or Europe. The personal qualities of Isabella d'Este were also admirable if judged by the standards of the Renaissance. Amid much profligacy she lived without reproach, and displayed a genuine capacity for the domestic affections. Like other rulers of the period, she acclaimed the winning cause without much thought of former allies, but such was the way of the world in the days of Machiavelli. As Mrs. Ady says: "She would have risked her life for the sake of advancing the interests of her husband and children or brothers, but she did not hesitate to ask Cæsar Borgia for the statues of which he had robbed her brother-in-law, and danced merrily at the ball given by Louis XII. while her old friend and kinsman Duke Lodovico languished in the dungeons of Loches." When this reservation regarding her political cold-bloodedness has been made, the biographer can praise Isabelle d'Este with a clear conscience. Lorenzo the Magnificent did not play his rôle more perfectly or with greater sincerity. Her learning was very considerable, and the degree of her interest in the various branches of art may be inferred from her correspondence. She devoted forty letters to a painting by Giovanni Bellini, and fifty-three to one by Perugino. She was generous and considerate. That she did not have a taste for devotion like Rénée of Ferrara is true, but she was the offspring of a pagan movement. Concerning the present biography we need only say that it confirms the favorable judgments which were formed of Mrs. Ady's earlier book on Beatrice d'Este. It is learned and graceful. When Luzio and Renier produce their long-promised life of their favorite Duchess, it may be more elaborate, but we doubt whether it will be more sprightly or more discriminating.

—Mr. Morris K. Jesup, in his latest report as President of the American Museum of Natural History of New York, gives a summary of the work accomplished during the year by the different departments of that institution and by the various exploring expeditions under its control. The department of vertebrate palæontology has maintained five expeditions in the field, which have contributed some notable additions to its collections. Among them are a complete skeleton of an upper miocene three-toed horse, a skull and jaws of the horned dinosaur *Triceratops*, and three complete skeletons of a rare cretaceous reptile, *Champsosaurus*. The most important accession of invertebrate animals is a collection of cœlenterates, consisting of about two hundred specimens of West Indian corals, actinians, and alcyonarians, collected by Dr. Duerden in Jamaica. The collection of fishes has received from the Hon. George M. Bowers specimens of a new genus and species of fish, *Mistichthys luzonensis*, from the Philippine Islands, the smallest known vertebrate. During the year the department of anthropology has installed several collections not previously exhibited, notably the Hyde collections from the ancient cliff-houses, burial caves, and ruined pueblos of Colorado, Utah, and New Mexico. This department has maintained expeditions in several parts of the United States and in British Columbia, Mexico, Central America, Siberia, and China. Messrs. Bogoras and Jochelson have finished their researches on behalf of the Jesup North Pacific expedition in northeastern Siberia, and the aim of the expedition to collect full information concerning all the tribes of the North Pacific coast has in the main been accomplished. The whole district from Columbia River in America westward to the Lena in Siberia has been covered, and the study of the material gathered reveals a closer relationship between the peoples of northeastern Asia and northwestern America than has hitherto been supposed. A comparison of the customs and traditions of certain tribes indicates that in culture at least they must be regarded as one. Dr. Hrdlička of the Hyde expedition has obtained anthropometric data and many photographs relating to twenty-one tribes in the southwestern Territories and in northern Mexico, and has secured several skulls and skeletons from this region, including the first Yaqui skulls known. The explorations of Mr. Saville of the Mexican expedition, in the State of Oaxaca, throw much light on the burial customs of the ancient Zapotecans. This expedition has also secured some rare specimens of gold, copper, and jadeite, and the Duke of Loubat has contributed a valuable collection of gems from Oaxaca.

SAYCE'S RELIGIONS OF ANCIENT EGYPT.

The Religions of Ancient Egypt and Babylon. By A. H. Sayce, D.D., LL.D., Professor of Assyriology, Oxford. (The Gifford Lectures Delivered in Aberdeen.) Edinburgh: T. & T. Clark; New York: Charles Scribner's Sons. 1902. Pp. vi., 509.

Professor Sayce is full to bubbling over with suggestions of every description, which he pours forth in print in an incessant series of volumes. As a natural result, it is generally easy to pick his work to pieces and point out innumerable major and minor mistakes, disagreements, and impossibilities. On this account, also, his works are rarely to be recommended to the beginner or the person unfamiliar with the subject, who is likely to be misled by such fascinating speculations, so stated that they seem to him, as they do for the time certainly to Professor Sayce, as altogether proved. It must be said, on the other hand, that many of Professor Sayce's suggestions are of great value, and that he has done most useful pioneer work in many fields.

In this volume he wanders in fields which are particularly dear to him, as affording the better opportunity for bold hypothesis —the borderlands of history. The first half of the volume, dealing with the religion of ancient Egypt, is more sober, and, we are inclined to think, more valuable than the second half. Through the whole ten chapters in which the religion of ancient Egypt is discussed runs the hypothesis of the Asiatic origin of the Pharaonic Egyptians. He believes that the Egypt of history is the result of an invasion of the Nile Valley by a Semitic population from Asia, which, after a long struggle, recollections of which survive in the Horus myths and in various folk-tales, succeeded in overwhelming and imposing itself upon the native African population, which latter, however, continued to the last to form the backbone of Egypt. The conflicting practices and beliefs of the Egyptian religion he traces back in general to the two different populations which were thus united. The tendency to fetish and animal worship comes from the native African population, who are akin in this regard to the negroes of Central Africa. The Asiatic Semites, on the other hand, held that man was created in the image of God, and they therefore represented the gods in human form. The combination of these two ideas produced the peculiar composite creatures with the body of a man and the head of a hawk, jackal, etc., so characteristic of the Egyptian representations of the gods. The divine nature of kings, as incarnations of the god himself, so distinctive a feature of Egyptian religious and political life, are derived from the Asiatic invaders; and the Babylonian inscriptions in which Sargon of Akkad, Naram Sin, and others give themselves the title of god, are cited in proof of this. The practice of mummification, in contrast with the earlier use revealed by the excavations at Negada, where the bodies were buried without mummification, and secondary burial was practised, are likewise ascribed to the influence of the Asiatic invaders.

Now, in point of fact, Semitic burials, as we know them, from both Babylonian and Palestinian exploration, are like the primitive burials in Egypt and do not in the least resemble the later Egyptian use, where the bodies were mummified; and long after mummification had become the general practice in Egypt, the Semitic inhabitants of Babylonia and Palestine buried their dead, frequently at least, in a fragmentary condition, skulls and other bones being tumbled together helter-skelter in almost any sort of receptacle. So, also, in the matter of the deification of sovereigns, while it is true that some of the Semitic sovereigns of Babylonia were deified, yet this can scarcely be maintained to be a Semitic practice. The indications are rather that it was due to foreign influences. With the full dominance of Semites in Babylonia it seems to have passed away; and in other Semitic countries no trace of its existence has hitherto been discovered. In these two cases Professor Sayce seems to have been carried away by the charm of his own theory, so that he has neglected carefully to consider the facts at present available; and in general we think that this is true of the whole of his theory of the Asiatic origin of the Egyptian civilization, which plays so important a part in the volume. It is undoubtedly true, and he has made it abundantly plain, that the Egyptian religion was very composite, and, from the philosophic standpoint, an incoherent and illogical combination of a considerable number of divergent beliefs and practices. He has traced in the religious development the rise and fall of the influence of various nomes; and the final result, if the religion at any period can be called a finality, contains elements drawn from many different cults, places, and periods. His treatment of the evidence of these diversities of origin is full of suggestiveness, even though we do not accept his main theory as proved.

If we were to single out any one chapter of this section as more interesting than an-

other, it would perhaps be that on the popular religion of Egypt.

"In a crater-like hollow of the mountain cliff of Shêkh Herîdî there are two domed tombs, dedicated not to a Christian or a Mohammedan saint, but to a snake and his female mate. Shêkh Herîdî, in fact, is a serpent, and the place he inhabits is holy ground. Pilgrimages are made annually to it, and the festival of the 'Shêkh,' which takes place in the month that follows Ramadan, is attended by crowds of sailors and other devout believers, who encamp for days together in the neighborhood of the shrine."

But Shêkh Herîdî is really the lineal descendant of a serpent which has been worshipped in this same neighborhood since the prehistoric days of Egypt. A bronze serpent with the head of Zeus Serapis has been found near the same place, and the nome itself was called Du-Hefi, "the mountain of the snake." Elsewhere, sacred trees are found under which are set by the fellahin to-day offerings of bread and water, the most famous of these trees being a special object of veneration to the Christians, who, after the manner of religious inheritance common everywhere, represent it as the tree under whose branches the holy family rested during their sojourn in Egypt.

Professor Sayce classes the Egyptian as one among the few inventive races of mankind, to whom we owe "the chief moulds into which religious thought has since been thrown," the doctrine of a Trinity, the incarnation of the Deity through a Virgin birth, the principle of emanation out of which the gnostic systems grew, and much of the psychology and eschatology of the Christian religion. But while claiming so great a debt of Christianity to the Egyptian religion or religions for the suggestion of its doctrines, he most emphatically differentiates developed and completed Christianity from the religion which gave to it these crude suggestions.

The second half of the volume deals with the religion of the Babylonians. Fourteen years ago, Professor Sayce delivered a course of lectures for the Hibbert trustees on this same topic, which was a pioneer work. Referring to that volume, he says: "My lectures were necessarily provisional and preliminary only, and I had to content myself with erecting a scaffold on which others might build. The time had not yet come for writing a systematic description of Babylonian religion, and of the phases through which it passed during the long centuries of its existence." And to-day he feels that the conditions are much the same. The evidence is still scanty and imperfect, and our knowledge of the religious beliefs of Babylonia and Assyria at best only piecemeal. In the interval between these two courses of lectures several works have appeared, dealing with the religion of the Babylonians and Assyrians, notably the handbook of Professor Jastrow, a conservative and careful investigation of the data now at hand. It is to be regretted that Professor Sayce did not make more use of such works as this latter, instead of forming brilliant theories to which he appears to endeavor to fit the facts.

As in his treatment of the Egyptian religion, the main theory which runs through these lectures is that of two conflicting elements, an earlier Sumerian faith, which is Shamanistic, a belief in spirits, ghosts, and demons, and a later religion, superimposed upon this and affected by it, of a higher order, the belief in gods and goddesses; the goddesses of this later Babylonian religion, however, being nothing more than the female spirits of the Sumerian faith. En-lil of Nippur, the lord of the spirits, is the characteristic god of the Sumerian period. But our author is compelled to recognize a striking divergence between the religious ideas which he believes to have emanated from Nippur, and those which emanated from the equally Sumerian Eridu, where the god Ea was worshipped. The different character of this latter worship he attributes to the fact that at some early period the Sumerian religion of Eridu must have been dominated by a non-Sumerian people. The names of the gods of Eridu are all, according to him, Sumerian; but the attributes not being those which he conceives of as Sumerian, he assumes this non-Sumerian influence. This is perhaps a fair specimen of the method which he pursues in general. Another specimen of his rash theories lies in his treatment of the influence of the cults of the two neighboring cities of Eridu and Ur. Eridu, according to him, lies on the alluvial ground among the marshes, and was the ancient port of Babylonia, while the neighboring Ur lay on the edge of the Arabian plateau. On this difference in position he bases a theory with regard to the difference of the religious influences emanating from the two cities. In point of fact, he has precisely reversed their positions. Ur lies on the alluvial soil close to the Euphrates, Eridu some miles to the westward on the very edge of the Arabian plateau.

In this part of the volume, as in the first part, Professor Sayce lays much stress on the points of resemblance between Egyptian and Babylonian beliefs and cults, which he thinks are evidence of the Semitic and even Babylonian origin of the race which built up, by its conquest of Egypt, the Pharaonic civilization. It seems to us that the greater part of those resemblances certainly are due to the natural development of similar primal conceptions, which are to be found not only in Babylonia and Egypt, but practically everywhere throughout the world. The trinities of the Babylonians and Egyptians may be paralleled by the trinities of the Indian religions, and all three are due not to borrowing somewhat similar ideas, but to thought development from common ideas. In one essential point Sayce notes a striking difference between the religions of Babylonia and Egypt. Egyptian religious thought deals very largely with the world beyond the grave. In contrast with this, the Babylonian religion limited itself practically to the present life. "The world beyond the grave was a place of unspeakable dreariness. The Babylonian was punished in this world for his sins and shortcomings." The magical element which seems to have been, to judge from the incantations and religious texts that have come down to us, so prominent in the Babylonian religion, Sayce ascribes to the influence of the Sumerian element. A study of Hebrew literature shows practically the same conceptions prevalent among the people of Palestine, and it may be said that, underlying any religion, there is a similar element—the survival of that animism according to which primitive man interprets the world, attributing to animate and inanimate objects and to the powers of nature spiritual existences comparable to the spiritual existence which he feels in himself.

Had the remarkable legislative code of Hammurabi been discovered before these lectures were delivered, doubtless Sayce would have amplified his discussion of Babylonian morality and legislation. That code makes it clear that practical morality embodied in legislation formed an essential part of the old Babylonian religion, precisely as it did of the Hebrew; it is one of the most striking of the many striking points of resemblance yet discovered between Babylonian and Israelite cults and practices.

THE SAGA OF KING HORN.

King Horn: A Middle English Romance. Edited by Joseph Hall. Oxford: Clarendon Press; New York: H. Frowde. 1901.

King Horn, Floriz and Blancheflur, The Assumption of Our Lady. Re-edited by George H. McKnight. (E. E. T. S. Original Series, 14.) London: Kegan Paul, Trench, Trübner & Co. 1866 (re-edited 1901).

The Story of Horn and Rimenhild. By William Henry Schofield. (Publications of the Modern Language Society of America, vol. xviii., pp. 1-83). Baltimore. 1903.

It would be easy to fill this column with the titles of recent monographs devoted to the story of King Horn, a romance so interesting in itself, offering so many general problems and extant in so many versions, that the attention which has been given to it cannot be regarded as excessive. Nearly all the English legendary stories—"Havelok," "Bevis of Hampton," "Guy of Warwick," even "Hereward the Wake"—have been transmitted through French or Latin redactions, and have unquestionably suffered in the process. Horn has passed for the single legend of pre-Conquest origin which has come down in a right English tradition. It has been extraordinarily prolific and long lived. In the twelfth century it was taken up by an Anglo-Norman jongleur, Mestre Thomas, who did it at length in the assonantal form of a *chanson de geste.* The shortest and apparently purest form of the story is that of the thirteenth century, "Geste of King Horn." Another English version, "Horn Childe," much modified and not uninfluenced by the French redaction, was recited early in the fourteenth century, and mentioned among the "romans of prys" parodied in "Sir Thopas." The climactical scene of "Horn Childe" was passed down in ballads which were still sung when Motherwell was collecting his minstrelsy. Harking backward, the French romance of the twelfth century was, towards the end of the fourteenth, done over into a prose romance entitled "Ponthus et Sidoine," which became very popular and was translated twice into English and twice into German, one of which last versions led a chapbook life as late as the second half of the eighteenth century, and was in the sixteenth century turned back into an Icelandic narrative poem or *rímur.* As Dr. Schofield maintains, with much plausibility, that the legend was originally of Scandinavian growth, the life history thus briefly traced constitutes an extraordinary and probably unique example of boxing the legendary compass.

The legend itself belongs to a familiar series of exile and return stories. King

Murry of Suddenne is slain by the Saracens, and his youthful son Horn set afloat with his fellows in a frail boat. Good chance brings them to Westnesse, where the King receives them hospitably and has them trained as knights. The princess Rimenhild falls deeply in love with Horn, who in beauty and accomplishments far outshines the rest. He refuses her not wholly discreet advances until he shall have won his knighthood. This degree granted, the proof of his valor comes with a descent of Saracens. Horn's victory is clouded by the treachery of his companion Fikenhild, who whispers slanderously of the innocent affair with the princess. Rimenhild, when she knows Horn is to be exiled, gives him a talismanic ring, and the lovers swear to be true to each other for a seven years' term.

Horn's exile is passed in Ireland, under a *nom de guerre*. Again he slays Saracen invaders, among them the murderer of his father, and refuses courteously the hand of the King's daughter and the succession. Meanwhile the Princess Rimenhild is being forced into an unwelcome marriage with King Modi of Reynis. Her messenger finds Horn in Ireland, and calls him to the rescue, but is himself drowned on the return voyage. Horn, landing in Westnesse, gains access to the wedding-feast disguised as a begging palmer, demands drink of Rimenhild, and slips her ring into the cup, bidding her pledge Horn. Recognition follows, and the discomfiture of King Modi, who was "made all bloody." But Horn refuses to marry his princess until he has redeemed his kingdom of Suddenne from the Saracens, and very foolishly he leaves her in the care of the traitor Fikenhild.

To reconquer Suddenne is an easy task. Horn's mother is found in hiding, and the people acclaim their Christian king. But Fikenhild has meanwhile immured Rimenhild in a sea-girt castle. Warned of his betrothed's peril through a dream, Horn sails back, enters the castle with his comitatus disguised as minstrels, slays Fikenhild, weds Rimenhild, gives his faithful friend Athulf the lovelorn daughter of the Irish King, and rules his two island kingdoms in God's law until death ends his wedded bliss.

Beyond noting that the intermittent Saracens are Danes, the story English, and dating probably from the tenth-century Danish invasions, little headway had been made in determining the origin or the geography of the legend. Mr. Hall and Dr. McKnight treat the matter gingerly, locating the story in South England; and Mr. Hall, for no apparent reason, opines that the legend was originally Celtic. Dr. Schofield's illuminating article appears to settle this matter once for all. He finds that Horn's kingdom of Suddenne is the Isle of Man. Westnesse is, of course, the west coast of England. On this theory, all of Horn's otherwise impossible voyages become reasonable. The argument is rather circumstantial than direct, for all these names were vaguely and variously employed. Since the story is Manx, it must date from the Viking occupation of that island. Several of the names, proper and geographical, betray this Norse derivation, and the legend, which may have a kernel of historical fact, is analogous to the "Gunnlaugssaga" and the "Laxdoela saga." It follows, then, that there must have been a lost English version (say of the eleventh century), which—through an intermediate French redaction (lost), Professor Schofield thinks—gave us the most primitive form extant—the "Geste of King Horn," and was variously modified in the French Romance and in the later English version.

For a Scandinavian origin and the Isle of Man the evidence seems conclusive. At other points, while admiring the fertility and suggestiveness of Dr. Schofield's method, one is tempted to take issue with him. Is there, for example, sufficient reason for supposing that the "Geste of King Horn" is a translation of a lost French version? Professor Morsbach has proved the point to his own satisfaction, in an article published in the 'Festschrift für Wendelin Foerster' (Halle: Max Niemeyer, 1902). But the argument comes to saying that a handful of the Anglo-Saxon (or Norse?) names in "King Horn" are in Gallicized form. This seems a very slender peg upon which to hang any weighty conclusion. "The Geste of King Horn" was composed not earlier than the middle of the thirteenth century. By this time numbers of Anglo-Saxon names had gone by the board. Suddene, Ailmar, Ailbrus were, in the thirteenth century, quite as fanciful as Tintagel, Gawain, Bedivere to-day. The anonymous poet of the "Geste of King Horn" naturally used the names that were familiar to himself and his hearers in preference to the obsolete, if purer, names that lay before him in some older text. We see precisely this process in the Harleian MS. of the "Geste," which adopts two forms—Allof (for Murry) and Godmod (for Cutberd), from the French romance, with no other indication of contamination from that source. Accordingly, while there may have been one or many lost French versions of King Horn, to create one merely to account for the Gallic coloring of the proper names is to explain a very simple matter over-elaborately. The French coloring was in the air in which the "Geste of King Horn" grew.

Of the always perplexing version "Horn Childe," Dr. Schofield disposes very prettily by showing that there is contamination with an historical tradition of a Danish inroad into Northumberland, possibly that described in the saga of Olaf Tryggvason. King Hatheolf of the romance is identified with Eadulf Earl of Northumbria from 966. Even the apparently legendary Malkan, slayer of Hatheolf, appears to be Malcolm, King of Scots, and it seems probable that the whole beginning of "Horn Childe" is based upon an older poem concerning Eadulf, now lost. In any case, it is clearly demonstrated that "Horn Childe" need not be considered in elucidating the more primitive forms of the Saga. Schofield's study suggests, what has already been inferred from the style and metre of the "Geste," that there must have existed a number of early middle-English romances, upon native themes, far superior in quality to those later versions which have come down to us.

The consideration of Dr. Schofield's generally triumphant hypothesis has left us little space for the editions of Hall and McKnight. But the preliminary discussion will have shown that the text is valuable enough to justify a minute editorial care which in a less important romance would be sheer pedantry. The mere existence of two editions covering so nearly the same ground shows the need of a philological clearing house. Dr. McKnight should not have toiled over his new edition of Lumby while Mr. Hall was doing the same work much better. And, contrariwise, there should have been some way for Mr. Hall to lend the plates of his parallel texts to the Early English Texts Society. A comparison of the two editions is everywhere in favor of Hall. He prints the three texts parallel, numbering each separately. McKnight, to save space, prints the Harleian MS. at the foot of the page, and keeps the numbering even, text by text, by reckoning all the lines in whichever version found. For example, McKnight's line 401 in all three texts is actually l. 383 of the London text, 392 of the Oxford, and 381 of the Cambridge. This makes it almost impossible to use McKnight with any earlier edition unless first the texts be severally renumbered with the pen. Hall punctuates only the best MS. (C.), printing O and L diplomatically. McKnight punctuates and recapitalizes all three, which brings in a host of minor infidelities to his originals and inconsistencies with himself. McKnight's critical apparatus is neither well nor ill done. Hall's is virtually definitive, and his lists of parallel phrases and formulas from other romances, in the notes, are fuller than any previous collection and worthy of all praise. Both editors deserve commendation for printing all three MSS. To construct a critical text from such material as is at hand for "King Horn" is a mere seminary exercise. On the score of accuracy the advantage is ever with Hall. No one who has himself experienced the treachery of the eye and of the types will wish to dwell upon McKnight's manifold minor transgressions, of which a few material corrections will conclude this notice. Both editors stick to routine business and have nothing original to say on the question of the legend. Hall's book is an admirable piece of patient scholarship, almost incredibly accurate in details, and indispensable to all who deal with the earliest English version of "King Horn," or, for that matter, with the later romance of "Horn Childe," of which a reprint is appended. To be corrected in McKnight are (Harleian MS. 2253, by his own line numbering), l. 320, *he* read *heo;* l. 352, *aknęu* read *aknen;* l. 1544 *seide* read *ferde;* 1591, *harpeirs* read *harperis*. On the other hand, Hall's readings of MS. O. ll. 60, 61, seem very doubtful. The present writer's independent collations of the Laud MS. bear out McKnight's *atteth* (but perhaps *all ethe* is the true reading) and *dethe*. Hall, exceptionally, seems to be amending somewhat desperately a hopelessly corrupt couplet.

The Heart of John Wesley's Journal. With an Introduction by Hugh Price Hughes, M.A., and an Appreciation of the Journal by Augustine Birrell, K.C. Edited by Percy Livingstone Parker. Fleming H. Revell Co.

In his old age Wesley expressed regret that he had not insisted on a Methodist dress as simple as that of the Quakers; mean, too, in its material. It is as if the publishers of these extracts from his journal had taken a hint from that expression, so mean is the appearance of their book. But we soon forget this when we have set

out to read. The introduction by the Rev. Hugh Price Hughes, now dead, is brief but to the point. It compares Wesley's journal with Fox's and with Newman's 'Apologia.' It calls attention to the fact that Wesley's reformation, unlike Luther's, was essentially a working-class movement; his itinerary, extending to 225,000 miles, mostly on horseback, being deliberately intended to avoid the extremes of wealth and poverty. A better introduction is Mr. Birrell's, already familiar to his habitual readers, but here reproduced on well-considered grounds. But there are some exaggerations. We are told that for many years 8,000 miles was the extent of Wesley's travel, and that he frequently preached 5,000 times in a year. But Overton, a careful biographer, gives the total number of his sermons as 40,000, a yearly average of but 740, and Wesley himself, in his successive birthday jubilations, never sets his miles of annual travel above 6,000, fixing the minimum at 3,500. With the roads as they were then, this was enough in all conscience. There is no doubt as regards Mr. Birrell's final opinion, that we can learn better what manner of man Wesley was from his journal than anywhere else. There is some doubt that, from the same source, we can best learn the character of Wesley's time. He lived the intensive life. He did not see widely beyond the horizon of his personal work, and in much that he saw he had no part, and consequently made no report of it.

Only those who know Wesley's journal in its entirety can judge justly as to whether what we have here is indeed the heart of it, as Mr. Parker's title claims. We do not seem to get much more of striking interest than in Tyerman's biography, the fullest and the best of the many written until now. But we get this and that striking incident more wound about with circumstance than in the biographies, and better for this difference. Some things are minimized which bulked large in Wesley's life: his theological conflict with Whitefield; his relations with his termagant wife; his lack of judgment generally where women were concerned. The journal began in 1735 and ended in 1790. In the early parts we have a full account of his miserable failure in Georgia, and clandestine leave. It was certainly to court suspicion of personal motives for him to refuse the sacrament to the woman who had just refused to him her hand in marriage. Returning to England, he came into port just as Whitefield was setting sail for Georgia, where he did himself even less credit than Wesley. Shortly Wesley came under the influence of Peter Böhler, the Moravian, and was convinced that he had never been converted, and later that he had the necessary experience. As to the non-conversion there is a foot note undated, "I am not sure of this." Böhler's advice to Wesley, "Preach faith as if you believed it, and then you will believe it," is not very different from Keble's advice to Arnold—that he should preach the doctrine of the Trinity, though not believing it, if haply he might reach a better mind.

In 1738 Wesley renewed certain former resolutions. The first was, "To use absolute openness and unreserve with all I should converse with." Resolves in general are remarkable for their frangibility; but this one was well kept—so well that we find ourselves wondering that such fearless candor did not mean a broken head for Wesley at least once a week. The second resolution makes it easier to understand how he could make the first. It was, "To labor after continual seriousness, not willingly indulging myself in any the least levity of behavior, or in laughter; no, not for a moment." It marked one defect of Wesley's quality that the keeping of this resolution was not difficult. There was no laughter in him, no humor. Had there been, his journal would not have contained many things it does; for the things reported would not have happened. He would not have rallied every fellow-traveller immediately on the condition of his soul, his danger of eternal fire. His lack of humor went deep, nourishing the roots of his belief in special providence. A spark of humor here and there would have saved him from the presumption that the order of the universe was controlled by God with exact reference to his comfort or convenience. Egotism is oftener lack of humor than it is anything else, and Wesley's egotism was immense, flattering him that the rain or sun, when he was preaching, was adjusted to his wishes by divine interposition, and that his organs of digestion were subject to miraculous regulation by the hand of God.

This supreme self-confidence made for that fearlessness with which he encountered mobs and opposition of all kinds. There must have been something exceedingly impressive in a manner by which so many base fellows were abashed, and so many hostile inclinations converted into friendly services. The remarkable thing about the mobs is that each went to pieces like a house of cards. If much of this effect must be conceded to the calm dignity of Wesley's presence, much more must go to the account of his exaggeration of the elements of danger involved in the opposition to his preaching. If we read Mr. Birrell's sober statement with a sense of collapse, we are convinced of its substantial truth as we go through the book. "Wesley," he says, "was occasionally hustled, and once or twice pelted with mud or stones, but at no time were his sufferings at the hands of the mob to be compared with the indignities it was long the fashion to heap upon the heads of parliamentary candidates." What does impress Mr. Birrell, and what will impress every reader of the journal, is the horrible condition of Newgate and other jails, and the brutalities of the judges, magistrates, and the criminal code. Another strong impression is that of Wesley's powers of endurance. His perils by land and water are insignificant compared with the long strain of travel and preaching in all sorts of weather, the travel over the worst imaginable roads, the preaching often done at five o'clock in the morning, showing the kind of courage which Napoleon admired. So great was Wesley's tendency to exaggerate everything personal to himself that one would gladly have some surer standard of the crowds attendant on his preaching than his reckoning, to which twenty or thirty thousand was not an unusual mark. Breakfasting with Whitefield, October 28, 1765, he finds him "an old, old man, though he has hardly seen fifty years, while I, who am now in my sixty-third year, find no disorder, no decay, no difference from what I was at five and twenty." Nine years later there is a similar boast. He has none of the infirmities of age, and has lost some of those of his youth. "The chief means are: (1) My constantly rising at four, for about fifty years; (2) my generally preaching at five in the morning—one of the most healthy exercises in the world; ((3) my never travelling less, by sea or land, than four thousand five hundred miles a year"—an increase of one thousand on an earlier estimate.

There are many items that refresh our previous knowledge of the man: his original distaste for field preaching; his mother's dealings with her children, which taught them to "cry softly"; literary and personal judgments, as of Luther and Laurence Sterne; his taste in sculpture, which preferred above all distinctly the worst thing in Westminster Abbey; his first reading of some book on the slave-trade, "published by an honest Quaker"; his delight in the seizures and convulsions of women under the stress of his preaching. It is one of the paradoxes of early Methodism that these seizures resulted from the more restrained preaching of Wesley as they did not from the more emotional preaching of Whitefield; and that, while the latter suspected them, the former clung to them. In regard to the entry of February 12, 1772, it should be noted that it was of the slave-trade, and not of slavery, as commonly quoted, that he writes as "that execrable sum of all villanies."

A History of American Political Theories. By C. Edward Merriam. Macmillan Co. 1903.

The system of government established after allegiance to Great Britain was thrown off by this country was a novel experiment. There may have been parallels in antiquity, but in 1788 there was in the Old World no democratic nation. Yet the Revolution and the Constitution had both to be justified, and political theories were brought out and adapted to existing conditions. As the conditions changed, partly from the growth of the sentiment that caused the suffrage to be extended, partly from the problem of slavery and the convulsion that ended it, these theories required modification, and the history of the changes that have taken place deserves, as Mr. Merriam says, more attention than it has received. His essay in this direction is pleasantly written, and gives a clear view of the arguments employed by our prominent statesmen. It is substantially accurate in its presentation of the leading theories. We incline to the opinion, however, that the subject has received more attention than Mr. Merriam supposes, and that it has received and deserves attention of a somewhat different character from that which he has given it.

For, in spite of the fact that the experiment was new, no new theories were involved. The conceptions of social contract, of natural right, of sovereignty—these are the raw material, not only of our political theories, but of political theory the world over. They have been examined by numberless profound scholars and philosophers whose contributions cannot be ignored. But, on consulting the bibliography annexed to this work, we do not find the name of a single foreign author. Examining the text, we find Mr. Bryce referred to once, merely as the author of the 'American Commonwealth'; yet Mr. Bryce, in

his recently published 'Studies,' deals directly with many of the developments here discussed, and deals with them in a way so admirably succinct and conclusive that it ought to have ended discussion. This is notably true of the concept of sovereignty; the difficulties surrounding which, as Mr Bryce says, are largely factitious, and spring from the attempts made to answer questions essentially different by the same terms. These difficulties have figured so prominently in our debates as to make Mr. Bryce's illuminating criticism invaluable, and it is unfortunate that it should be ignored.

Mr. Merriam, we should add, refers to Locke's influence; and in three or four concluding pages we find brief mention of some dozen or more writers as sources of inspiration of American political theory. No attempt is made to trace this influence, except in occasional allusions. On the other hand, the views of many comparatively insignificant persons are set forth, apparently on the principle that, as they are Americans, their political theories must be American political theories. This method necessarily results in vagueness, as when we read that the public is ready for measures whereby the general welfare may be advanced, "regardless of whether individuals as such are benefited thereby or not." The process of advancing general welfare without benefiting any one deserves a more minute description if it is in favor with the public; but perhaps we should be told, as in the case of natural rights and the social contract, that "the precise condition of public opinion is not easy to estimate."

The course of political theory in this country has been largely determined by politics. When British rule became irksome, it was necessary to find reasons for throwing it off, and the doctrine of political equality or natural right, and of government as founded on consent or agreement, as worked out by Locke and his school, were ready for use. They were asserted in the Declaration and embodied in the Bills of Rights. Presently, to the disgust of the Federalists, they were asserted by the common people in the demand for universal suffrage. Then they were reasserted by the Abolitionists and repudiated by the slave-owners, as inconsistent with their "peculiar institution." The latter maintained that men were not equal, and that there was no truth in the contract theory of government, and hence no binding force in the Constitution. The North conquered in the civil war, and forced the people of the South to accept the Constitution, thus violating the contract theory in defending it. Hence the metaphysical theory of the Nation came into vogue, and is now generally taught in our schools. While we are engaged in subjugating other peoples, despotic principles are indispensable. Were we to be overcome by another power, we should perhaps return to the belief that men have a natural right to freedom.

It is instructive to see that the requirements of empire have brought our professors of political science fairly over to Calhoun's theory. He maintained that men were not born free; they must be fitted for liberty. The negro race was inferior, and must be governed by the white race. This was a benevolent proceeding on the part of the whites; they were not to exploit the negro, but to be his guardian. In his anxiety to defend "the standpoint of modern political science" (*i. e.*, that men have no natural right to liberty) from being identified with the slave-owners' theory, Mr. Merriam goes too far. He says that, according to this theory, the negro was deprived of all rights whatever. But only a few pages before, he shows that the Southerners were careful to explain that the negro was protected in his rights by law, and that he was deprived of political rights only because he was not fit to exercise them. The two "standpoints" are essentially one, and it is a waste of sophistry to try to distinguish them. As Lincoln said, "It is the same old serpent"; the principle that certain men, or certain races of men, are good enough to govern others without their consent, is the principle of despotism.

The exposition of Calhoun's theory is perhaps the best part of this book, and Calhoun was one of the closest political reasoners that the world has produced. John Adams's views are also carefully brought out; those of Jefferson less adequately, although it is well to remind us that they were not derived from French sources to the extent commonly assumed. We are surprised to find no reference made to the growth of the party system as affecting political theory. What has so greatly influenced practice must be reflected in the principles by which practice is justified. In general, however, the work is successful as a description of the attitudes taken from time to time by our statesmen; indeed, considering its brevity, it deserves much praise in this regard.

As a critical work, however, we must pronounce it superficial. There is an "irrepressible conflict" between the theory which employs the concepts of natural right and the equality of men as persons, and that which denies this equality, and resorts to the concept of the "State" as a person exalted over human beings. The former theory is based not only on moral but also on religious foundations. Nature, said Chrysostom, is God; as men are equal in the sight of God, so are they in their essential rights by nature. The "State of Nature" is, of course, an historical fiction, and there was never an actual social compact; but men have always felt that there must be a moral basis for government which the "State" does not furnish. Above states and governments they recognize God and Nature; and to these concepts they will always appeal when their highest welfare is threatened by human authority. Unless this is clearly perceived, we cannot adequately comprehend the course of political theory—American, or other—in the past, nor forecast its future.

The Sources of Plutarch's Life of Cicero. (Publications of the University of Pennsylvania. Series in Philology and Literature. Vol. VIII., No. 2.) By Alfred Gudeman. Published for the University. Boston: Ginn & Co.

An investigation into the sources of a comparatively unimportant piece of ancient literature would not ordinarily demand much attention in these columns, but the case before us involves the question of method in philological research in a way which deserves more than a mere passing notice. Dr. Gudeman begins with some very true and pertinent remarks about the defects of source investigations in the past, and then lays down a very reasonable method of procedure for such investigations: first, find out the various sources of information available at the time when your text was written, and, by a process of elimination, clear your list of all sources which, for whatever reason, your author could not have consulted. "It will then be, in many cases, comparatively easy to decide to what extent he probably utilized the authorities still remaining, provided, of course, that their character, purpose and scope are satisfactorily ascertainable." Dr. Gudeman then asserts the practical unanimity of previous scholars in the opinion that Plutarch made use of various works of Cicero himself, of Sallust's 'Catiline,' and of Tiro's 'De Vita Ciceronis' and 'De Jocis Ciceronis,' and follows this assertion with an absolute denial that Plutarch consulted for his biography any single one of the works in question. On the positive side, he argues at length, and with great apparent confidence, for the lost life by Suetonius as one of Plutarch's principal sources.

Now when we remember the many coincidences which naturally suggest indebtedness to the works above mentioned, it will be seen at once that the validity of the eliminating process would be of great importance in any case, and all the more so when the source finally fixed upon with so much confidence has not come down to us, and so cannot be submitted to any searching tests. Let us notice, then, a few of the main points in Dr. Gudeman's procedure:

"We may first take up the 'Letters of Cicero.' Now the mere presumption that Plutarch had been acquainted with this unique and inexhaustible thesaurus of historical and autobiographical information at once puts us on the horns of a dilemma: if he was, he must either have read the entire correspondence (which, as may be observed in passing, was probably double the size of our extant collection), and then have culled from it, like a modern Drumann, what appeared relevant to his purpose, or else he did not consult any part of it at first hand."

Now this rigid *all* or *none* alternative exists only in the writer's misguided imagination. When the horns of a dilemma are thus wide apart, with plenty of safe standing ground between them, we refuse to be placed peremptorily upon the one or the other. Plutarch *may* have done what many another man *has* done since—consulted the letters at first hand to some extent, and based statements of supposed fact upon them, without ransacking the whole collection. Dr. Gudeman's assertions that he had not the leisure to read the whole, and that he could not have had the disposition to do so, are alike incapable of substantiation and very unscientific props to insert beneath any important conclusion in a work of literary research. Similarly unscientific is the discovery of "*positive* evidence that the biographer never read the correspondence of Cicero" in the fact that reference to his correspondence with Trebatius, in chapter 37 of the biography, does not tally correctly with the letters of Cicero to Trebatius which are still extant. Now the obvious comment is, that the writer is guilty of the fallacy of drawing a universal conclusion from narrowly limited premises; but even the narrow conclusion to which he

might seem to be entitled would not be unassailable, for Cicero was a man of many moods, often at variance with himself in different letters, and the assumption that Plutarch's allusion is to some letter not now in existence, gratuitous though Dr. Gudeman may fairly declare it, is still possibly true. Elimination must demonstrably eliminate if it is to be a fit tool for scientific investigation.

As to Cicero's 'Brutus,' generally regarded as one of the sources of the biography, "Plutarch cannot have read a line of this work, so glaring are the contradictions." Now most human beings, including many of those who write books, both ancient and modern, are not afflicted with such uncompromising impossibilities. They *can* read one line of a work, or *ten* lines of it, occasionally *all* of it, and still fall into contradictions in the use of it, more or less glaring, according to the point of view of the critic. As Dr. Gudeman here and there admits the carelessness of Plutarch in other matters, perhaps he goes too far in excluding carelessness or some other human weakness as making possible the apparent use of material from one source together with other material from a second source out of harmony with the first.

We might go on almost indefinitely with these rigid "cannots," if it were worth while. It is sufficient to say that due regard for sound philological method will soften well nigh every one of them into a "probably did not," or something equally distant from the realm of convincing demonstration. Many careful readers will agree that Dr. Gudeman's conclusions are *probably* true; but it is equally certain that many competent scholars will still regard it as exceedingly likely that Plutarch made more or less direct use of a number of the sources impugned. Nor on the positive side can it be said that the arguments adduced are such as to *compel* a reasonable man's assent to the lost life by Suetonius as an important source. It may easily have been so, and that is all. The scholar who shall take our feet out of the miry clay and set us upon the solid ground in respect to these problems must be able to recognize and eschew all ungrounded assumptions, unnecessary dilemmas, and logical non-sequiturs. The modern lack of care for logic, and lack of training in it, are hopelessly vitiating much of the philological work of the present day, as they are the work of the specialist in many other lines of investigation. Dr. Gudeman is one of the best read among our younger generation of classicists, and has done some extremely valuable work—his monumental edition of the 'Dialogus' of Tacitus, for instance. We may reasonably look to him for great services to the cause of the classics in the years to come; but his evident delight in proving that the opinions of previous scholars will not bear the test of "an unprejudiced examination" must not be allowed to betray him into a neglect of the rigid application of logic and common sense to his own processes. And we have already indicated that he does not stand alone in his exposure to that danger.

Clara Schumann. Von Berthold Litzmann. Band I. Leipzig: Breitkopf & Härtel.

No woman of the nineteenth century occupied a more prominent position in the musical world than Clara Schumann, *née* Wieck; in the realm of instrumental music she ranks, indeed, above all other women. Her compositions have never been surpassed, if equalled, by any one of her sex, and as a pianist she was, even before her marriage, ranked with Thalberg and other idols of that time; some, indeed, put her on a level, as a player, with Liszt and Chopin. On such grounds alone she would be entitled to a biography; but there are weightier claims still. For five years she was the betrothed, and for sixteen years the wife, of Robert Schumann; wherefore all that concerns her during these twenty-one years reflects new light on the life of that great composer. The biographer in this case was in luck. He undertook his task at the request of the relatives, who placed at his disposal much unpublished material. Robert's letters had been printed before, but Clara's had not, and she was an extremely interesting letter-writer, even as a young girl. More important, even, than these letters is a series of manuscript diaries in no fewer than forty-seven quarto volumes, covering the years 1827 to 1896. This diary, to be sure, was begun by her father for her, and up to 1838 it mirrors his opinions rather than hers; but that does not make it any the less valuable. With such aids, Herr Litzmann could hardly have failed to write an interesting biography. This first volume covers the years 1819 to 1840; how many more there are to be, we are not informed.

Friedrich Wieck, Clara's father, was an eminent piano-teacher, whose fame attracted, among others, young Robert Schumann. He soon found the daughter more interesting than the father, and the two confessed their love to each other, never doubting that it would be approved by her father. But they were most wofully mistaken. Wieck had predestined his daughter from her babyhood for an artist; to her he sacrificed his time and means; she had proved very talented, and had begun a brilliant and quite profitable career as concert pianist at the age of ten. To have her suddenly snatched away from him and converted into a *Hausfrau* was a very bitter thought to him—in fact, an intolerable thought. It has been known for a long time that he strenuously opposed the marriage, but the details of this struggle are here for the first time made public. Wieck went to almost incredible extremes. At first he pretended that Schumann's poverty was his chief ground of opposition; when Schumann proved that his income was equal to that of hundreds of the most esteemed families in Leipzig, Wieck feigned various other excuses, resorting to the vilest slanders, such as accusing him of being a common drunkard. Nay, he began to hate and persecute his own daughter, who loved him, but loved Schumann more; and when she gave concerts, he would send communications to the music stores of the towns where she was to appear, denouncing her as "a shameless girl, demoralized by a scoundrel." Indeed, his demeanor was almost that of a madman. His stubbornness inflicted cruel tortures on the lovers; but luckily, so far as Clara's artistic career was concerned, his denunciations aided rather than hindered her, as no one could help sympathizing with the talented, brave, pure, noble, persecuted girl; and the courts finally decided against the malicious father, in favor of the lovers.

Herr Litzmann, though a man of letters and not a musician, has also succeeded in giving a vivid impression of Clara's art and her experiences with artists. She met nearly all the famous masters of her time and played with some of them—Liszt, Chopin, Mendelssohn. Spohr and even Spontini praised her, and Paganini was enthusiastic over her playing when she was quite a young girl. At first she played chiefly piano music of the Paganini type—brilliant, showy; but later, especially under the influence of Schumann, she became a genuine artist interpreter. She was one of the first to play Beethoven well; the first to introduce the romantic school into Vienna. For a long time, however, she did not dare to play the novel pieces of her beloved Robert, except to her friends. Even Liszt failed to conquer the public with this music, which is now popular everywhere. But of all the services Clara Schumann has rendered the world, the greatest is that she inspired the best of Schumann's songs and some of the best of his pianoforte pieces—the F sharp minor sonata, the Fantasia, the Novelettes, the Kinderscenen, etc. Of this fact there is abundant evidence in the pages of this volume.

History of Early Steamboat Navigation on the Missouri River, etc. By H. M. Chittenden, Captain Corps of Engineers, U. S. A. In two volumes. Vol. I. New York: Francis P. Harper.

Trans-Mississippi history during the last century was shaped if not controlled by the Missouri River. Jefferson's order in 1803 to Capt. Lewis was: Go to the end of it and you will find something flowing westward. Not only was the great river such a wilderness clue, but it brought to light a happier hunting-ground for fur than the world had known. For forty years thereafter to go up the Missouri was the highway to fortune. Again, it became from first to last our warpath against Indians. It was every inch such in conflicts with Mormons and Mexicans. Nor in the civil war was its strategic value small. Throughout its valley, where combined Creoles and Canadians were first in the field, those Latin races longest held out against Teutonic Yankees from the East. In the rush to gold Meccas nothing helped the overlanders so universally and so effectively as the watercourse near whose ultimate springs the *spolia opima*, the supreme placer, Alder Gulch, was unearthed. No water, fresh or salt, was so perilous. Though a steamer had entered its mouth in 1819, it was forty years before such a craft had forced a passage to its uppermost navigable point (2,644 miles). The census of its wrecks falls but five below three hundred; and had every white man's grave along its course been plainly marked, the voyager would never be out of sight of pathetic reminders of futile contests with a whirligig at all times vengeful to intruders.

Each stage in life along the Missouri has followed as a surprise on the heels of the one before it—hunters supplanting the Indian, and overlanders the hunters. Boats displaced canoes, steamers boats, and railroads steamers. Through all stages the river, bestriding half a continent like a colossus, has been the nerve on which war, peace, emigration, and settlement have moved with all their equipage. The book

before us is such a monograph of vicissitudes in the life of this unique monster as could not have been made had not the author (an army engineer) done expert work along it from end to end and come to love it with all its faults, so that he writes that "few scenes in nature appeal so strongly to the eye of an artist" (p. 84). The bird that we nurse is the bird that we love. But aware that no historian has ever rivalled Plutarch the biographer, Capt. Chittenden has enlivened his science with a charming human and personal interest, added to his own. His alternative title is "Life and Adventures of Joseph La Barge, Pioneer Navigator and Indian Trader, for Fifty Years Identified with the Commerce of the Missouri Valley." Indeed, half the book was written as dictated at the fireside by this navigational Nestor (1815-99), who alone from among his French contemporaries had escaped with eye undimmed to describe a body of time, its form and pressure, which none would willingly let die.

No reader can forget the frank notices, more or less critical, of celebrities, domestic and foreign, who for a generation begged standing-room beside the pilot, "whose accumulated tales of many years were to the last as new to the tenderfoot as if told for the first time" (p. 131). In hundreds of Carnegie libraries the dwellers in as many towns will in these volumes, romantic as 'Robinson Crusoe,' feel a special pleasure, while learning the true story and site of mythical historic landmarks near their own local habitations. How much the twin authors tell us which we are sorry not to have known sooner, is more than enough for a note-writer to hint at. One detail in the chapter on boats and boating before steamboats may be mentioned. Though bullboats may be treated elsewhere, we believe bulltubs are not. This aboriginal invention—a single hide stretched over a basket, shaped like half an egg-shell, and as buoyant—was used by squaws for bearing freight, and on occasion a single passenger, with the skin gathered water-tight about his neck. It was towed by a string of skin held between the teeth of a swimmer. Irving was carried over deep waters in a bulltub—as the present writer was informed by Henry L. Ellsworth, the Indian Commissioner under whose charge the tour of the prairies was in part carried out, and knowing whom was an open-sesame into Sunnyside.

Taming our continental leviathan was long a pet project of Congress with a lavish outlay of millions, and only in 1902 given up as a Lilliputian struggle with Brobdingnag. Simultaneous, however, with this confession that the Big Muddy was not made to be penned up, came a Congressional movement to let it loose, based on conviction that its oozy immensities, if they had free course in irrigation, would be glorified, turning the American desert into a garden. Its channel is twice as long as the Mississippi above the confluence, and its source-altitude well-nigh three times as great. Caught, caged, and distributed by methods easily practicable, it would be transformed into a Western Nile, repeating the Egyptian miracle when the earth brought forth by handfuls, and men gathered corn as the sand of the sea.

Method of the Recitation. By C. and F. McMurry. Macmillan.

The aim of the modern study of pedagogy is, we take it, to discover and define universal principles of method in learning; and in so far as these principles can be established and, we may add, put in practice, a "science of education" may be said to exist. The aim of Messrs McMurry is to lay down certain rules for the guidance of teachers in primary schools with "illustrated lessons." The authors lay stress on the truth first enforced by Socrates and later emphasized by Pestalozzi, that "logical notions are the goal of all instruction," and they devote one chapter to an explanation of the difference between individual and general notions. Five formal steps are indicated as essential for the acquirement of knowledge: they are preparation, presentation, comparison, generalization, and application. These formal steps "indicate the order of the movement of the mind." The criticism passed on the ordinary text-book, which is essentially deductive, is doubtless just; the five steps mentioned above are expressly inductive, and one can hardly imagine that an intelligent teacher does not apply them to some extent, whether consciously or not. The writers of this little guide regularly refer to women rather than men as teachers, implying either that the feminine mind especially needs this discipline in method, or that all primary work is in the hands of women.

The inductive method cannot well be illustrated to any extent in the limits of an ordinary text-book, though the attempt has been made of late years, notably in Latin. The insistence on and illustration of its advantages in these pages will be of service to primary teachers, who will, of course, be on their guard against supposing that either the inductive or deductive method can be used exclusively. A born teacher needs none of these hints and "steps" and illustrations in order to get in touch with and inspire a class, but all are not born teachers, and the volume may be commended for clearness and suggestiveness. In the chapter entitled "Lesson Plans" we find Longfellow's "Excelsior" presented as a lesson plan for children of thirteen. But will it bring about that "increased love of literature" which is laid down as the teacher's aim in dwelling on this poem? Surely a child of thirteen should be provided with stronger meat than "Excelsior," which it may well have acquired five years earlier. It would be an insult to the intelligence of a child of that age to ask it the questions which are suggested: "Was the young man joyous or sad?"; "Was he attractive or unattractive in appearance?"; "Did he stop?"—and so on.

Tennyson's "Revenge" and "Ode on the Duke of Wellington" are more truly "literature" than is "Excelsior," while fully as many moral lessons may be drawn from them as from the fate of Longfellow's "beautiful young man." When we are told that "the teaching of 'Excelsior' would probably occupy not less than three or four recitation periods," we can only wonder what is the level of poetry that engages the minds of classes still younger; and when we read that the "Pupil's Aim" is "to learn what became of a young man who attempted to climb the Alps," we can at least imagine ways in which at any age three or four recitation periods might be better employed. But it is always unfair to measure the value of this sort of pedagogy by its own illustrations. The science of education is in its infancy, and we welcome any attempt to support its tottering steps with rules and hints and methods and the rest, always reserving our opinion that the intelligent, well-informed man or woman will dispense with such aids, and that on the unintelligent and ill-informed such excellent and logical advice will be thrown away.

The Great Marquess. By John Willcock. Scribners.

The whole tone of this biography of Archibald Campbell, eighth Earl and first Marquess of Argyll (1607?-1661), is controversial, and, oddly enough, a hint of this fact is given in the title, despite the apparent innocence of the latter. The same epithet, "Great," has been applied to Montrose, who was a contemporary and rival of Argyll. Mr. Willcock is no friend of Montrose, although he is willing to allow that the Cavalier possessed traits which superficially are more attractive than those of Argyll. In his final parallel he likens them to the sons of Isaac.

"Montrose recalls the attractive qualities of Esau, while in Argyll we see much of the moral and spiritual strength of Jacob. In Montrose we have impulsiveness and chivalry, combined with a certain levity in forsaking one cause and embracing another, and a brilliancy of heroic achievement which suddenly died down and left behind it no lasting benefit or even result, while there were in Argyll a strong susceptibility to religious impressions, a keen shrewdness of judgment, and a tenacity of purpose which remind us of Rebecca's favorite son. Our instinctive feelings led us to receive into our hearts the one type of character, while our maturer judgments approve the other as greater and more worthy."

Mr. Willcock disclaims all idea of attempting to write a panegyric of Argyll, but observes, "We think that we have set down an array of facts which will render it difficult for the detractor of the great Marquess of Argyll to resume his hateful work."

The main charges against Argyll can be briefly summarized. He has frequently been accused, alike by those who sympathize with the extreme Royalists and the extreme Covenanters, of having been a selfish and cold-blooded politician, a hypocrite in matters of religion, and a coward on the field of battle. During the struggle between Charles I. and Parliament, Argyll was in many ways the most important man in Scotland, but, after the regicide, he followed the unpopular policy of joining Charles II. without becoming an ardent Royalist. As the result of falling between both groups of extremists, he was soon in the awkward position of being a party by himself, and after the Restoration he was beheaded for complicity with the Government of Cromwell. "He fell," says Gardiner, "unaided and unregretted, because a base intrigue for the maintenance of his own influence had taken the place of manful championship of his nation's cause."

Mr. Willcock's Life of Argyll, which owes its existence to a suggestion from Mr. C. H. Firth, is learned with all the learning of the Scottish antiquary, and undoubtedly

deserves to be styled a work of merit even when judged by historical rather than antiquarian standards. At the same time it seems to us unduly biassed in Argyll's favor, especially where it is a question of the latter's personal courage and of his relations toward the Commonwealth in 1653-54. Mr. Willcock does, indeed, awaken some sympathy for the ex-Covenanter, by describing his difficulties after the battle of Worcester, but we find it impossible to accept an estimate of Argyll which leaves him in possession of the leading virtues, both cardinal and theological. Regarding his powers of mind, there is less ground of disagreement, and here we cannot quarrel with Mr. Willcock's judgment:

"Even his enemies themselves are constrained to bear witness to the astonishing intellectual gifts which he possessed, and which enabled him to guide and control the politics of Scotland for so many years, and to make a deep impression upon English political life during the period when the two nations were united in offering resistance to the arbitrary Government of Charles I., and in breaking down the military power by which he would fain have maintained it."

Silverware and Jewelry. By H. Wilson. D. Appleton & Co.

The second volume of Mr. Lethaby's series of technical handbooks has appeared. We have already noticed that on 'Bookbinding and the Care of Books,' prepared by Douglas Cockerell, with drawings by Noel Rooke. The present one shows diagrams and other illustrations seeming to be by the author, except as they are photographic. We must repeat here of this series what was said in our former notice, that it is difficult to imagine a more carefully laid plan or to hope for better prospects of perfect success in carrying it out. The books are sure to be of remarkable, perhaps of unexampled, value to those who wish to know how the decorative arts are practised in reality. This is exemplified by Mr. Wilson's Chapter X., which is devoted to "Silver Solder and Enamelling Solder," with some words about solders for large work; and the chapter that follows has for its heading "Soldering, Use of Borax, The Blowpipe, Soldering Lamps." Herein the beginner is advised to make his own solder, and a good recipe for it is printed in full, while three cuts of half a page each and one full-page illustration are inserted in the text. So with Chapter XI., which deals with the process of soldering; three illustrations of the width of the page are inserted in three of its five pages, leaving not much text. Brevity has been not so much "consulted" as used instinctively. Toward the close of the book there is a very brief chapter on "Coloring, Darkening, and Oxydizing Silver and Gold," and another on "Gilding," and here, perhaps, brevity has been carried too far. There are difficulties which arise in coloring metals; a process not very simple except in one or two of its forms. (We are not thinking now of alloys applied to the surface by incrustation and the like, but of the mere coloring of the metal.) The two pages given to this rather large subject are necessarily inadequate. So with gilding; two and a half pages allow of only definitions, so to speak; one might expect to get as much information from a modern encyclopædia. Meantime, as there was no room for fuller treatment, the student is to consider himself under orders to weigh, to learn thoroughly, that which can be learned thoroughly by the aid of so simple a handbook as this, and leave the rest to a later stage of his development; unless, indeed, he is prepared to try experiments patiently, using such brief advice as is given here and going a little farther on his own account. The illustrations are extremely well drawn, vigorous, and intelligible in that effective broad-line, clear black-and-white way which some of the best English draughtsmen affect, and which Mr. Lethaby himself has used, or at least encouraged, in that very noble book which he and the late Harold Swainson made in 1894 as a record of the church of Santa Sophia, and again of the first handbook in this series.

BOOKS OF THE WEEK.

TEACHERS WANTED

We are compelled to have a few more qualified Teachers at once. More calls this year than ever before. Salaries range from three hundred to three thousand. Write at once. Schools supplied with Teachers free of cost. Address with stamp,

American Teachers' Association,
J. L. GRAHAM, LL.D., Manager,
Memphis, Tenn.

THE FISK TEACHERS' AGENCIES.
EVERETT O. FISK & Co., Proprietors.
Ashburton Place, Boston; 1505 Pa. Ave., Washington; 156 Fifth Ave., New York; 414 Cent. Bldg., Minneapolis; 533 Cooper Bldg., Denver; 80 Third St., Portland; 203 Mich. Bldg., Chicago; 525 Stimson Block, Los Angeles; Hyde Block, Spokane; 420 Parrot Bldg., San Francisco.

ALBANY TEACHERS' AGENCY,
81 Chapel St., Albany, N. Y.—Provides schools of all grades with competent teachers. Assists teachers in obtaining positions.
HARLAN P. FRENCH, Proprietor.

SCHERMERHORN Teachers' Agency.
Teachers—Schools—Tutors—Governess—Property. Tel. 6129-18th. JOHN C. ROCKWELL, Mgr., 3 E. 14th St., N. Y. C.

A Soldier
of
Conscience

A Volume in memory of the late

EDWARD P. CLARK

There is a brief biographical sketch written by Mrs. Clark, and the volume contains extracts from addresses made at Mr. Clark's funeral, and some of the many tributes paid to him in newspapers and private letters.

Edition Limited. Price $1.00

AN EDUCATIONAL DIRECTORY

I.—The Nation stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in The Nation has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 206 to 210 Broadway, N. Y.

LONGMANS, GREEN, & CO.'S NEW BOOKS

JOUBERT'S ELEMENTARY TREATISE ON ELECTRICITY AND MAGNETISM.

By G. Carey Foster, F.R.S., Fellow and Emeritus Professor of Physics in University College, London; and Alfred W. Porter, B.Sc., Fellow and Assistant Professor of Physics in University College, London. Founded on Joubert's "Traité Elémentaire d'Electricité." Second Edition. With 374 Illustrations and Diagrams. 8vo. pp. xx—568. $3.50.

ELECTRIC AND MAGNETIC CIRCUITS

By Ellis H. Crapper, M.I.E.E., Head of the Electrical Engineering Department in the University College, Sheffield. 8vo, pp. xii—380. $3.60.

THE ANNUAL REGISTER:

A Review of Public Events at Home and Abroad for the Year 1902. 8vo. $6.00.

The First Part of this volume is devoted to a résumé of the Political History of England during the year 1902. The events of Parliamentary life are noted, and the principal speeches summarized. Foreign and Colonial History are also dealt with.

In the Second Part a Chronological Summary is given of the principal events of the year, both foreign and domestic; this is followed by a Retrospect of Literature, Science, and Art, and an Obituary of Eminent Persons.

A full Index, which is an important feature of the book, adds very materially to its value as a work of reference.

*** Volumes of the Annual Register for the years 1863-1901 can still be had.

LIMITED EDITION

THE ELEMENTS OF ARCHITECTURE

Collected by Henry Wotton, Kt., from the best authors and examples. Royal 16mo, boards. $3.50 *net*.

*** This Edition is reprinted from the first impression, printed at London, in 1624, by John Bill; with the addition of the Dedication to Prince Charles, and the note on p. 70, which have been taken from the original draughts, in the copy presented by the Author to the Prince, and now preserved in the British Museum.

The issue is limited to 350 copies and is printed at the Chiswick Press on hand-made paper similar to that used for the Kelmscott Press books. The ornaments are designed by Herbert P. Horne for Miss S. T. Prideaux.

JUST READY

MORS ET VICTORIA

A Drama in Three Acts

Octavo, cloth extra. Printed at the Merrymount Press. pp. 120, $1.20 *net*. By mail, $1.28.

THREE SERMONS PREACHED IN THE CATHEDRAL CHURCH OF CHRIST, CANTERBURY,

On March 29, 1903, being the Sunday after the death of The Very Reverend Frederic William Farrar, D.D., F.R.S., Dean. 8vo. $1.00.

THE LIFE OF FATHER DOLLING

By the Rev. C. E. Osborne, Vicar of Seghill, Northumberland. Demy 8vo, with Portrait, pp. xv—357. $5.00.

"Mr. Osborne may be congratulated on having produced, within a year of Father Dolling's death, a biography of moderate compass and of the very deepest interest."—Guardian (London).

REUNION ESSAYS

By the Rev. W. R. Carson, Author of "A Eucharistic Eirenicon." Crown 8vo, pp. 258. $2.50.

Contents: The Evolution of Catholicism—A Moderate View of Papal Infallibility—The Social Aspect of Confession—The Kenosis of Christ—The Kenosis of the Church—The Maternity of God—The Personal Factor in Religious Belief — Anglican Concessions on the Invocation of Saints — The *Rationale* of Saint Worship. Appendix on the Non-Infallible Dogmatic Force of the Bull *Apostolicæ Curæ* of Pope Leo XIII. Condemning the Validity of the Holy Orders of the Church of England.

*** Of these Essays I. has been rewritten and very considerably enlarged, on the basis of an article in the Weekly Register. III. and IV. appeared in the same periodical in a slightly different form. VII., VIII., and IX. appeared in the American Ecclesiastical Review.

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

The Nation

The New York *Nation*, founded in 1865, and conducted with rare editorial continuity to the present time, enlisted from the beginning the willing service of the best morality and enlightenment of the country. The leading colleges and universities have freely contributed to its staff of writers, have used it constantly for purposes of instruction, have made it the vehicle of interchange of sentiment, of literary inquiry, of advertisement for all good causes. It is kept on file at such institutions, and in every public library of importance, and is incessantly consulted. As a forum of general discussion it has never had a peer, and its total body of casual correspondence surpasses any of a like character ever brought together in this country. Its special correspondence has been not less remarkable, averaging more than a hundred letters yearly gathered from all quarters of the globe.

The Nation's literary criticism has, for carefulness, evenness, justice, and style, earned it the first place on this side of the water, and, by the consensus of foreign opinion, put it on a par with the best authorities in any country.

In politics it has made the same mark, and even more profound; but here the recognition has been less ungrudging because the spirit of party condemns independent and disinterested criticism, such as is welcomed in all branches of the scientific pursuit of truth.

The list of writers for *The Nation* speaks for itself as to the intellectual and moral company to which its readers are habituated; and these readers are themselves a class apart.

The subscription price of *The Nation* is Three Dollars per annum. Published by New York Evening Post Co., Broadway and Fulton St., New York.

The Nation.

NEW YORK, THURSDAY, JULY 9, 1903.

The Week.

The reason for the fresh outbreak of savagery in an American city displayed on Sunday in Evansville, Ind., was simply resentment at failure to lynch a negro who three days before killed a policeman, but who was spirited away in time to save him from lawless hanging or even burning. No white woman figures in this case as in the Wilmington shame. The excuse of the "one crime," therefore, fails again, as it has failed innumerable times, to account for white atrocity. But matters have come to such a pass that lynch law must prevail whatever a negro's crime, and no matter how many additional lives must be sacrificed. The Evansville company of the Indiana militia, together with some 200 deputy sheriffs, struck a blow for law and order on Monday night which should have far-reaching effects. In defence of sixteen negro prisoners they fired upon a mob of several thousand of their townspeople, with the result that they killed six rioters and onlookers, and wounded twenty-one others, four fatally. As four of the soldiers were also wounded, it is evident that the firing was done in self-defence. But the troops were well within their rights as defenders of common order. The city had been practically in possession of the mob for three days, the Mayor's demands for peace and order had been defied, and it was a question whether the authorities or the mob should rule.

Mr. Booker Washington has for some time suffered from a certain amount of suspicion on the part of other leaders of his race. Some of them, like Professor Du Bois, have thought him too cold towards the higher education of the negro. Others, like Mr. Thomas Fortune, have considered him lukewarm in the matter of negro political rights. Such misunderstandings of a strong and self-centred man who moves on steadily in his one chosen and successful field of work, are natural; but Mr. Washington did much to dissipate them by his speech before the Afro-American Council at Louisville on Thursday. He powerfully struck the note of equality before the law for all men, white or black. In that alone, he contended, lies safety for either. The whole fabric of our Government is imperilled when you once permit any class or color to be discriminated against. This is simply the President's doctrine of "a square deal" for the negro. Treat him like a man. Deal with him as you do with any other citizen. If you pass laws to restrict the suffrage by educational or property qualifications, make them absolutely impartial, and not the hollow shams they are in Alabama, for instance, where every illiterate white rapscallion is allowed to vote, while thousands of educated and well-to-do negroes are robbed of the ballot.

The peonage abuses in Alabama were so open and atrocious that the punishment of guilty individuals has followed promptly upon the revelation of their crimes. So far, none of these new slave-drivers has made any defence before the Federal courts. But the remedy for slavery by legal subterfuge lies not with the courts, but with the people. In Alabama, for ten years past, there has been no white man brave enough to speak out against the trade in negroes. The present agitation and the exemplary punishment of notorious offenders will be of only temporary avail unless the people of Alabama are aroused to jealousy for their personal rights. For though the indifference which has till now prevailed is an expression of race prejudice, at bottom the rights of all citizens of Alabama are at stake. No people which allows the rights of any class of the community to be persistently overriden is long a free people. In Philadelphia, as Mr. Lincoln Steffens shows strikingly in *McClure's Magazine*, a wealthy and intelligent community is reduced to political impotence because it has permitted the baser politicians to work their will with the election laws. In Alabama are seen the more horrible results of allowing ignorant and vicious persons to become masters not only of the negro's vote and work, but of his life and limb. It is not enough in either case to imprison a few law-breakers; the community must assert itself in such fashion that the attempt to become possessed of a citizen's vote or his person shall be odious. Condemnation from the citizens of Alabama is more necessary in this peonage matter than the sentence of the Federal courts; and that rebuke should be both audible and explicit.

One grudging word is frequently uttered by Southern newspapers in their references to the peonage cases. Admitting the cruelties, the illegalities, the disgrace, they yet say that "politics" has been allowed to color the prosecution of the guilty men. This they variously denounce as "despicable," "intolerable," etc. Now if widespread interest in an event of national importance means "politics," all we have to say is that it is wholly unavoidable. Americans are built that way. They cannot help being concerned at what is going on in their own country; and if political evils require a political remedy, they cast about to find it. But is the South itself so innocent of the wiles of politicians in all the inflamed state of feeling about the negro? When the New Orleans *Times-Democrat*, for example, affirms that the "act of madness of Mr. Theodore Roosevelt" in inviting Booker Washington to lunch has "incited to mob rule," is it speaking words of truth and soberness, or echoing the language of Southern politicians? Their ways are well understood. Their chief aim is to maintain themselves in office by "keeping the South solid." The method of doing it is to harp on the prejudice against the negro. When the Republican Presidents used to appoint unworthy negroes to office, the cry was, "There, you see what they will do if we do not all stand together." When Mr. Roosevelt selected educated colored men of high character, the alarm was raised, "This means social equality." Politics for politics, the South knows how to inject the race question into it more skilfully and constantly than the North.

One plank in the Iowa platform will be read with great attention at the South. It is that opposing "all legislation designed to accomplish the disfranchisement of citizens upon lines of race, color, or station in life." There is added a condemnation of measures "adopted by the Democratic party in certain States of the Union to accomplish that end." Following the similar deliverance of the Ohio Republicans, this serves fair notice of the rise of a new political issue. The South is not going to be "let alone" in its discrimination against one great class of citizens of the United States. If the Federal courts do not interfere to pronounce the disfranchising statutes null and void, Congress will have to intervene, and the Republican party will be compelled to take up and complete its historic work in behalf of the negro.

The State of Georgia has honorably refused to distribute school funds according to the tax receipts from the blacks and whites respectively. The resolution to that effect, which was overwhelmingly voted down in the Legislature, had a kind of specious, arithmetical attractiveness. But the legislators of Georgia were prompt to see that the principle of racial school budgets was wholly un-American, and that its application in other cases than the negroes, would leave uneducated the classes that most need school training. It is only fair to add that the other Southern

States have in this matter followed a straight course. In several instances it has been attempted to make the negroes bear the whole cost of their own schooling; but invariably such bills have been defeated. The South generally reserves its sophisms and grandfather clauses for political use. Georgia has certainly not suffered any of the imagined horrors which are the only apology for discriminating legislation in other States. These would do well to study in Georgia the superiority of counsels of fairness over promptings of prejudice or panic.

What can Gov. Taft be thinking of to put into his first message by the new cable another plea for tariff revision? Did he imagine that the Republican party had girdled the earth in forty minutes in order to be told again of its standing injustice to the Filipinos? Gov. Taft cannot have heard the news from Iowa, or even from his own Ohio. Otherwise, he would have known that all his party, from the President down, are "stand-patters" whom the mere mention of tariff reduction throws into convulsions. Is their peace of mind thus to be rudely disturbed by way of Manila? If these maladroit references to the sacred white elephant of the tariff do not cease, Republicans will leave off praising Gov. Taft's services. It is all very fine to represent your country worthily, but what the Republican party expects of every man is to swear that the sun would not shine or the grass grow but for protection, and, as the Scriptures say, "having done all to stand"—pat!

A reform of the rural free-delivery service, as announced by the Post-Office Department, should work a great improvement. But the obliteration of district lines will not suffice. Congressmen can plead as earnestly and pull as many wires to secure a free-delivery service lying but partly in their districts as if their constituents were to receive the benefit of the whole of it. The question is: Will the postal authorities conduct this service, and open up new routes, utterly regardless of the effect on the personal fortunes of favored Congressmen? It is easy to promise this when Congress is not in session and while the communication of Representatives with the Department is chiefly by letter, but how will it be when they come back, besiege the Postmaster-General, and explain to him that their entire political careers turn on his consenting to break his rules? We do not wish to be pessimistic, but this is what he must prepare himself for. And we greatly fear that, in the language of the reporters, he will be "visibly affected" by the tales which he will hear. The free rural delivery and the rest of the postal service will stand a chance of being put on a real business basis when the Department is placed under the charge of some man who will decline to make it the nursery of political fortunes and careers, Congressional or otherwise.

Secretary Root's order to investigate the connection of Congressman Littauer with army glove contracts is so prompt that some friends of the statesman from Gloversville are already talking about the statute of limitations. They also plead the imperious demands of war, which made it necessary to get work done quickly. It would, indeed, have been cruel to send ungloved soldiers to dare the rigors of a Cuban or a Philippine climate. Under the circumstances, criticism of Congressman Littauer's services to the Government in its hour of peril is unpatriotic. It is hinted that Senator Proctor's interest in marble headstones for dead soldiers may also come under review. Surely it is a fitting time to inquire into the basis of the popular belief that Senator Proctor cares not who makes the wars of a country, if only he may furnish headstones for the soldiers. In a few days, when this matter is open to the light, we may again hear the trumpet call of patriotism. Since the admirers of Perry Heath, Machen, and Beavers have already pointed with pride to the statute of limitations and the inexorable needs of war as the twin glories of our republic, we may amend Dr. Johnson, and declare that patriotism with the statute of limitations is the last refuge of a scoundrel.

The question of separate or joint Statehood for Oklahoma and Indian Territory is being debated as hotly in those localities as if they had power to settle it for themselves. The failure of Congress at the last session to confer Statehood on any of the territories has, it seems, made a live issue in Oklahoma of the question, "What are we to ask for next time?" On this question the two political parties have already taken sides. The Republican policy demands immediate Statehood, which practically means separate Statehood, since it is not proposed to admit Indian Territory before the five civilized tribes sever their tribal relations. The Republicans protest against "holding back one Territory until another is ready for Statehood, perhaps as a part of the former." The "single Staters," most of whom are Democrats, also declare that they want Statehood as soon as possible, but they do not believe in making Oklahoma and the Indian country "the two Rhode Islands of the West." As to Indian Territory, the sentiment there, so far as expressed, appears to be chiefly in favor of joint Statehood, which would give her a share in Oklahoma's prosperity. It does not seem in the least likely that all this argument will bring about anything approaching unanimity among the people of the Territories; and Congress, viewing the dissensions, will doubtless do what it would probably do in any case, and treat the whole question exactly as it pleases.

Judge Kirkpatrick's order that the receiver of the Asphalt Trust proceed against the promoters of that bankrupt concern, to recover exorbitant profits taken out by them at its organization, contains possibilities of considerable interest. The complaint is of an act not very unfamiliar in our recent industrial finance—the purchase of a company's stock at one figure, and the selling of that stock to a Trust at a very much larger figure; the sellers being also the organizers of the Trust. Thus, in the case of the United Asphalt, one of the constituent companies, the receiver charges that the difference between what Messrs. Barber, Elkins, and Greene paid for the stock and what they received for it from the Asphalt Trust, was $2,941,000. They bought this stock, he alleges, between the time when they organized the Trust and the time when they made the Trust acquire the United Asphalt. Similar allegations are made regarding other properties acquired. Shares in one smaller company were bought by the "insiders" at 48½ per share, and sold to the Trust for 100. The particular interest of this suit lies in the question whether the allegations can be proved in court. That such practices existed in the most flagrant form, with the Asphalt "promotion" as with a hundred others, nobody well informed on financial doings questions for a moment. But, naturally, legal proof is not so easily obtainable. Probably the defence will rest, as it usually does in cases of this nature, on a contention that the stock was bought in ignorance of a plan to absorb it into the Trust, or that the shares of the Trust, received in exchange for the stock of the subsidiary company, were not really worth the figure on which the estimate of promoters' profits is based. Every one knows the twists and turns of which a defendant financier in court, with skilful counsel, is capable. We have had some inkling of it in the preliminary fencing of the Shipyard case. The organizers of this Trust lost not a moment, after the company's collapse, in posing as public benefactors who had really lost money in promoting schemes of public utility.

Some praise is heard for the arbitration agreement concluded between the George A. Fuller Construction Company and the representatives of the building unions in this city; but it seems to be based not only upon ignorance of the real attitude of this company towards unionism, but also upon a superficial analysis of the actual contract. Nothing would seem fairer than an arbitration

board composed of two representatives of either party and a disinterested umpire; but is the plan sincerely proposed? How have this company and its employees contrived to keep the peace in the past, when other less fortunate contractors have been constantly embroiled with their workmen? Does the proposal for arbitration really indicate a change of attitude on the part of this company towards such walking delegates as Samuel J. Parks? All who understand the building situation in New York would like to hear these questions satisfactorily answered before hailing the Fuller corporation as pioneers of industrial conciliation.

But assuming for the moment that the agreement looks only towards peace with honor, it is burdened with two very doubtful stipulations. The construction company agrees to employ only members of the contracting unions, which reciprocally agree to keep the Fuller company supplied with labor in a way to give it an advantage over other builders. Such an agreement cannot remain long in force. It would be absurd, on the one hand, to suppose that the present federation of the building trades is permanent, or, on the other, that it will give the Fuller company the preference when it becomes more advantageous to work for other employers. Furthermore, the company apparently puts itself at the mercy of the unions in the matter of members of the arbitration board. At any time the representatives of the company may find themselves conferring with a brace of notoriously corrupt walking delegates. From this and other considerations it appears that the arbitration plan was made to be published, not to be used. Peace is really to be maintained by less public methods which other employers have declared to be intolerable. A wholesome settlement of the building-trades imbroglio will sooner be reached through President Eidlitz's policy of quiet resistance to the impossible demands and questionable practices of the union, than through a hasty treaty which says one thing and means another.

Monday was a busy day for Sam Parks—he of the thousand strikes. He got the housesmiths to pass resolutions censuring President Neidig, his recent opponent at the ballot-box, and to vote $5,000 for his own defence in the blackmail cases. Besides this, he opportunely managed to have the books "lost" which contained evidence as to his alleged blackmailing transactions, meanwhile persuading the Board of Building Trades to vote against the arbitration proposals of the recent conference between employers and unions. This latter action is purely advisory and will probably be disregarded by the unions. Before Mr. Parks is enrolled among the distinguished exponents of the strenuous life, it should be remembered that he is merely dying game. Even the baser beasts when cornered—like Parks between the law and the unions—will give a fairly lion-like exhibition of teeth and claws. His recent activities can bear only that color even to his friends and admirers.

According to all accounts, Tammany Hall is in great distress over the discovery that its leader, Charles F. Murphy, has not been released from responsibility for the dock-lease scandals by the statute of limitations. During most of the agitation over the revelations of the conduct of the old Dock Board, Murphy's friends have gone about perfectly contented. For everything which transpired prior to July 1, 1901, the statute of limitations already had run. From that time on, "Charlie" was ill and did not participate in the acts of the Board. The fact that his friends and relatives continued to prosper was not perhaps legally significant. But now it appears that "Charlie" did not remain invalided quite long enough. He very foolishly recovered somewhere along in December, and fell to signing leases, the legal responsibility for which has not yet been wiped out by the statute. No wonder Tammany is dismayed. Its leaders took no stock, probably, in Murphy's early bravado about desiring a public examination; but the statute of limitations was something which they could understand and appreciate. That, they felt, they might tie to with enthusiasm.

The enormous growth of our Canadian exports, estimated at $125,000,000 for the fiscal year ending June 30, will tempt devotees of the balance of trade theory to undue transports. They will argue something like this: Exports to Canada, $125,000,000, imports from Canada $55,000,000—Uncle Sam's credit in his trousers pocket $70,000,000. To our readers it may seem superfluous to say that Uncle Sam would have more reason to gloat over Canada trade if his credit balance were smaller. Our mills have lacked their wheat; in a great building period we should have had their lumber without paying too dearly for it; most of their natural products would have been readily convertible into profits in our hands, and there is nothing to say of that $70,000,000 trade balance except that it is uncomfortably large. Of course the increase of our exports by $12,000,000 is matter of rejoicing. It shows that a natural trade will leap over artificial obstructions, and it is an indication of what the trade across our northern border might be if a reciprocity should come about. Under such a happy dispensation, exports would undoubtedly greatly increase, but the real advantage to us would lie in the liberation of a stream of Canadian exports to the south, to be profitably employed in our great industries.

Openmindedness as a substitute for political convictions is faring ill in England. Already the protectionists have complained that Mr. Balfour, while making up his mind, deprived them of the only duty they had—the war tax on grain; and now some twoscore Conservatives, including the most influential members of the party, serve notice upon Mr. Balfour that he may carry the inquiring spirit as far as he will, but if he is to retain their votes, he must come out on the free-trade side. Sir Michael Hicks-Beach rather grimly suggested that these free-trade Unionists are really serving the Government as friends when they prevent the Ministry from misleading the voters. Thus day by day the Ministerial situation becomes more ludicrously impossible. Here is Mr. Balfour professing openmindedness while his Colonial Secretary is preaching protection and his Chancellor of the Exchequer is as sturdy for free trade. Balfour hesitates and says, "We shall see"; Chamberlain winks and says, "He'll come round"; the free-trade Unionists solemnly warn the country not to believe anything the Premier or Mr. Chamberlain may say on the matter of tariffs. Here is tolerance indeed, but it is the tolerance of reciprocal disrespect. Mr. Balfour has been gradually drifting into Mr. Chamberlain's views and language. He would stand morally in a stronger position if he would proclaim Joseph as his prophet. Certainly the stage of inquiry has passed when Unionists holding the balance of power are dictating what conclusion the inquirers must reach.

An extraordinary slip was made by Mr. Balfour when he denied that Sir Robert Peel ever had to face the questions of colonial and international trade as does the present Premier. For this a grandson of Peel sharply calls Mr. Balfour to task in the *Spectator*. Veiling his personal attack under the sarcastic pretence that it is only rebuking those "whose duty it is to inform him [Mr. Balfour] upon this important subject," he shows by plentiful citation, giving chapter and page, that his grandfather had, in fact, been compelled to deal with the very problems of the present. Preferential trade with the colonies is no new thing. It was the established system, was tried and found wanting, and was deliberately abolished by Peel in his act repealing the corn laws. Similarly did he reject retaliation against foreign nations. "I am not disposed," he said, "to withhold from ourselves the benefits of reduction of duties in order to force other nations to act in a reciprocal manner" (Life of Cobden, ii., p. 240). Thus it appears that Mr. Balfour's latest novelties are merely old fallacies.

"IDEAS" VS. CONVICTIONS.

Thomas Moore once heard some one maintain that "the word idea is the feminine of idiot." The derivation is given a new plausibility by the latest developments in connection with "the Iowa idea." The new Iowa Republican platform comes perilously near idiocy, so far as it relates to the tariff. It uses words, not to conceal thoughts, but to hide intentions, to mask divisions, and to make of a solemn political deliverance a species of thimble-rigging. Talk about driving a coach and four through the language of a resolution! A whole circus procession, clowns and all—especially clowns—could find room to disport itself between the meaningless phrases, the absurd balancing of contradictories, to be found in the Iowa tariff plank. Readers of this latest Allisonian masterpiece of indecision and non-committal will be tempted to smile and say, "Well, Slippery William can still carry water on both shoulders even in his old age."

But facts are too much for the most adroit verbiage. The platform was apparently constructed so as to allow Mr. Facing Bothways to stand upon it in perfect comfort; but its builders forgot that something had gone before. Two previous Republican conventions in Iowa had been so indiscreet as to affirm that the tariff offered a "shelter" to Trusts; and to demand a speedy revision of rates which bear hard upon the people. This was a programme. This was the Iowa idea. Now, with that record before the country, it is obvious that the slightest abatement in terms is a surrender. It will not do to point to Senator Allison's precious ambiguities about "impartial" duties that should be "equally opposed to foreign control and domestic monopoly," and that should be "changed from time to time." The Iowa idea was to change them at once, and especially to destroy the tariff shelters in which Trusts demonstrably take refuge. Gov. Cummins, it is true, with admirable grace in leek-eating, declares that the new platform means the same thing as the old, and that he, accepting a nomination upon it, will contend as before for immediate revision of the tariff and for denying protection to offensive Trusts; but every one except an office-seeker understands that a retreat has been sounded. Allison and Dolliver, Wilson and Shaw, have triumphed over Gov. Cummins. Even in Iowa the Republican party is joined to its tariff idols.

President Roosevelt took pains to deny in advance the authorship of the Iowa tariff plank. We do not know whether his scruples were literary or political. Either might be warranted. No writer with a reputation for explicit vigor would care to father the tortuous obscurities of the Iowa platform. Nor would any politician who yet retained the power to blush, choose to recite such a Good-Lord, Good-Devil confession of faith. But platforms, by whomsoever devised, cannot alter established facts or change political sentiments based upon them. It is the general belief of the people in Iowa that the tariff is cunningly devised to swell artificial profits at the expense of the consumer. Even Speaker Henderson confessed this in his letter to a constituent. He admitted that, if he could have his way, he would strike off the duties on steel and salt and pottery, under cover of which the farmers of Iowa were remorselessly bled. It is the widespread nature of this feeling in that State which has hitherto given Gov. Cummins his great popular support. It is that, too, which encourages the Democrats to take advanced ground on the tariff. They welcome the protection issue, even if the timid Republicans run to hide their heads in the sand. The tariff will be a live issue in the Iowa campaign. The more the Republicans try to smother it in circumlocutions, the more surely will it burst out and demand a hearing. Purely as a matter of party strategics, the Republicans have, by their shuffling cowardice, made the mistake of giving the Democrats a fine opportunity to pull themselves together, after their Bryanistic debauch, and to make a good fight for the State.

There is, however, a larger political aspect of this Iowa performance. An elastic platform signifies an elastic political conscience. Ideas war with convictions—an "idea" being, it appears, a kind of trick valid for this campaign only, designed to cheat the people, good enough until after election, but then to be shoved aside with other useless lumber. It is one of the grievous mischiefs which protection has wrought in our public life that it has led men thus to play fast and loose with their convictions. William B. Allison is an old free-trader. Probably he is such still by mental persuasion. So was Garfield. So, we suppose, is Mr. Roosevelt. But political exigency is allowed to eat into mental integrity. A jumble of dodging words is permitted to take the place of clear-cut affirmation of real belief. That way lies political insincerity —a fruitful mother of public vices. The freeman's heritage is to speak the thing he will though girt by friend or foe, and to act upon the truth which is warm in his heart. This Iowa jugglery shows us how protection destroys sincerity, and prevents men from either saying what they think or voting as they believe.

ANOTHER SCHOLAR IN POLITICS.

Congressman Littauer's explanation of his connection with the army glove contracts is interesting, but unconvincing. The gist of his defence is that Edmond R. Lyon of this city obtained a contract for the gloves, and that Lyon in turn bought the goods of Littauer Brothers. "In none of our transactions with Lyon," says Mr. Littauer, "had we any other interest, direct or indirect, except that of manufacturers selling goods directly to him."

Whether Mr. Littauer is legally guilty cannot be determined by trial in the newspapers. The courts alone can compel the production of the necessary evidence, and the courts alone can construe that Federal statute which declares in the most sweeping and explicit terms that no member of Congress shall be interested, "directly or indirectly," "in whole or in part," in any Government contract. The average layman, however, will see in the arrangement by which the work was done by Littauer Brothers, and the goods shipped straight from their factories to the Quartermaster, a very direct interest in the award of the contract to a firm which would buy of the Littauers. If they were not interested, the Congressman from the Twenty-second New York District showed singular philanthropy in his willingness to "call on Ludington" at the War Department "in reference to any other than the standard gauntlet." The theory that he would visit the Department for the simple pleasure of an abstract discussion of gloves—just as President Roosevelt used to attend a national convention in order to find a quiet and secluded spot where he could enjoy Herodotus in the original Greek—is hardly tenable. That theory, indeed, breaks down in the light of Congressman Littauer's note, "Divide profit over this figure, $1.55," and the agreement to share profit or loss with Lyon on another contract.

Should Mr. Littauer be tried before an able judge and an impartial jury, he would find his defence a formidable task. But before the bar of public opinion he cannot secure acquittal; for however carefully he may have avoided legal pitfalls, he has obviously been interested in the contracts. He has violated the spirit if not the letter of the law.

The case is another illustration of the effect of our lavish and loose methods of Government business. At the time of the civil war the term "army contract" became a byword. To be "as dishonest as an army contractor" was to touch the lowest depth. The trouble was that we were spending enormous sums in hot haste; and every rascal in the country jumped for his portion of plunder. To-day we are spending even larger sums with almost as much haste. Our income has been swollen beyond reason by an outrageously high tariff, and our outlay is correspondingly reckless. When the tariff pie is opened everybody rushes to Washington for his piece, and Congressmen have become used to voting for this schedule or that, simply in order to give themselves or their constituents a slice. From such legislation it is a short

step to the struggle for a share of the appropriations. These very Gloversville people whom Congressman Littauer represents so perfectly, have been among the most persistent beggars for tariff favors. If Congressman Littauer will vote for a tariff schedule that puts money into the pockets of Littauer Brothers, he does not show much grosser impropriety when he thrusts his finger into an army contract.

With such an example set by Senators and Representatives, the demoralization in the Postal Department and in other branches of the Government is inevitable. When everybody is grabbing, the postal clerk sees no reason why he should withhold his hand. By a stroke of the pen he can win 40 per cent. of the profit on mail bags; and he makes the stroke. With such fat plums dropping from every tree about him, he regards himself as a model of self-restraint if he merely helps his sons or other relatives into positions with firms to which he can show favors in return. He almost comes to think that he deserves warm praise for not robbing the Government outright.

The pity in Congressman Littauer's case is that the culprit is Congressman Littauer and not a man like Congressman Grosvenor. Of Grosvenor, people would expect nothing better; he has been notorious for years. No doubtful scheme in which he might embark would either surprise or shock. But Congressman Littauer is a shining example of a scholar in public life. He comes of a good family, he enjoys social position, he is a graduate of Harvard, he is a successful manufacturer, presumably with high ideals in business and in politics. He has had the advantage of close friendship with President Roosevelt, and he is well aware of the President's desire to have everything about him as "clean as a hound's tooth." Whatever may be said of other transgressors, Congressman Littauer has sinned against light.

In commenting the other day on Andrew D. White's demand for educated men in politics, we took occasion to say that the need is not so much for educated men as for men who can resist the argument that "everybody does" this or that which is vicious on its face, but which has become less ugly in popular judgment by reason of custom. To illustrate the signal failure of mere education, Congressman Littauer now presents himself as a notable instance. From him we looked for the behavior of a gentleman and a scholar. We get from him what we might expect from any ignorant and vicious man who had a chance at the public till.

THE MORAL OF MR. SCHWAB.

We think that the predominant feeling of right minds, in the presence of Mr. Charles M. Schwab's final breakdown, after receiving many rude buffets of fortune, is one of pity. He seems a victim. His generation, and the system of great finance upon which it was his lot to fall, have proved too much for him. The fine natural abilities with which he set out, the physical vigor, the mental energy, the technical training, the mastery of men—to-day they all appear but as so much splendid promise wrecked. The vast and remorseless machinery of financial speculation has drawn him in and left him bruised and bleeding.

Five years ago, Mr. Schwab's position was most enviable. He had found his work. The career open to his talents he had successfully run. Rising by industry and merit to be the managing head of the Carnegie Company, he was an inspiring example of the way in which this country spells opportunity, and in which among us talent pushes to the top. Blessed with health, enjoying the confidence of owners and men alike, he had "a heart that in his labor sings," and might have boasted, with Lowell, that such a heritage "a king might wish to hold in fee." Great powers finding happy exercise—there is a good definition of human felicity, and Mr. Schwab seemed to have it securely in his possession.

But the tempter lay in wait for him. It took the guise of those glittering rewards which the gambling mania holds out before those who would make haste to be rich. There is an undoubted peril here for every commanding talent. Eager syndicates stand ready to exploit it, exhaust it, and then fling it aside like a squeezed orange. The process has been seen in the literary world. Success has been the ruin of many a rising author. He has jumped at the money bait. The big checks waved in his face by competing publishers have dulled his artistic conscience, and he has sold poor work as if it were good, not perceiving that it was only himself that he was really selling—and degrading. Something like that seem to have been the seductions before which Mr. Schwab fell. Not to do his best work, but suddenly to get rich, became his ambition. The prizes dangled before his eyes dazzled him. With millions won and lost in daring speculations, with paper fortunes made by a stroke of the promoter's pen, why should he longer confine himself to the hum-drum task of simply managing with all his skill a great property? He incontinently joined the ranks of the financial plungers. In other words, pursuing fickle Fortune, he followed her up to and over the edge of the precipice, where it is her wont to lead so many of her votaries.

It would, of course, be idle to deny that Mr. Schwab displayed in all this a sorrowful lack of mental poise and moral fibre. He acted like a man whose head was turned. His rakish descent upon Monte Carlo was an eye-opener to the discerning. As we said at the time, it revealed a reckless spirit in a man whose position laid upon him the absolute obligation at least to appear conservative. It was, as we know, a grief to his friends; but it was more than that—it was a warning to investors. How could they know that the man who would ostentatiously stake thousands on the red, might not make ducks and drakes of their property, by transferring the scene of his gambling operations from Monte Carlo to Wall Street? As it turned out, we see that Mr. Schwab did, in fact, bear out the reputation he thus unwittingly won for himself. He was loud and lavish in his personal expenditures. His chief outside enterprise—the shipyard combination—appears in the light of judicial opinion to have been at best a gambling speculation; at worst, something still more culpable. The judicious, we are bound to say, were not surprised at the recent revelations affecting this concern. A shrewd old business man put the matter tersely, "What else could you expect from a Monte Carlo gambler?"

It is only because there are to be drawn from Mr. Schwab's case certain broad inferences and warnings, more significant than anything merely personal, that we have felt justified in referring to it. He has been unconsciously a powerful moral teacher. He has revealed to the observant the true nature of that world of "high finance" into which he so rashly ventured—with all its desperate chances and wild audacity and gambler's passion, so destructive, as we see, to physical and moral life alike. He has shown us what comes of "thinking in hundred millions," and living in a mad rivalry of luxury. The "get-rich-quick" method of Wall Street appears, in the light of Mr. Schwab's misfortunes, no better morally, and not even any more successful in the long run, than fleecing schemes on the Bowery. And he has done not a little to remind us that the old-fashioned moralities and the well-tried rules of business are still supreme. Financial follies surely come home to roost. New syndicates cannot enact new laws of morality. The gambler remains a gambler still, though he hazard millions. To have reinforced while illustrating these homely truths, and to have done something to lead the poor man, happy in useful work, not to scorn his lot, may easily prove to be Mr. Schwab's greatest contribution to his age.

MISPRAISE OF WESLEY.

The two-hundredth anniversary of the birth of John Wesley has naturally called attention to the character and work of that very remarkable man. It is not an easy task to overpraise him, nor to assess too highly the healthful influence he exerted. A hundred converging lines

of evidence convict the masses in England in the eighteenth century of having been literally brutalized. If they have measurably risen out of this condition, much of the credit is Wesley's.

But while it is hard to bestow too liberal praise upon the man or his work, it is easy, as some recent estimates of Wesley show, to do his fame an essential disservice by basing it upon a false foundation. Primarily and essentially, John Wesley was a preacher of righteousness to individuals. In his time "no single figure influenced so many minds, no single voice touched so many hearts. No other man did such a life's work for England." That he ever entertained any other idea of his vocation than that of summoning individuals to repentance is incredible; and however such a man may lack a true perspective in viewing his own work, there is very good ground for believing that his own idea of his own work was nearer the truth than that of his apologists, who see his greatest contribution to the sum of human welfare in some of the collateral secular movements to which Wesleyanism gave an incidental impetus.

This nicety of discrimination in bestowing praise is an affectation of our modern critical spirit. It allows us to venerate antiquity, but seldom upon traditional or common-sense grounds. From it the Reformation obtains a tolerant approval, not because the Roman Church was corrupt in practice and astray in doctrine, but because modern science would have been impossible without freedom of inquiry. By the same token, the American Revolution is to be justified, not because the colonies were really oppressed, but because the exigencies of world-politics would not warrant our continued connection with the British crown. It is the self-same spirit that sees with Ostrogorski the true worth of Wesley in the awakening of the popular political consciousness in the following century; or that discerns with Leslie Stephen his real significance in the intellectual impulse which culminated in the Oxford movement under Newman; or that discovers with Lecky the real grandeur of John Wesley in the social conservatism or torpor of the English masses when France was aflame with the Revolution. The truth seems to be that we are grown too squeamish nowadays to proclaim aloud that real essential good may spring from bringing multitudes of individuals to reflect soberly each upon his duty to his Maker and his fellow-men. A shame-faced admission that any particular individual contributed to the growth of humanitarianism is about as far as the cautious spirit of historical criticism thinks it safe to venture.

How greatly Wesley's admirers err in tracing his claim to transcendent greatness back to the secular influences which he indirectly released, may be judged from the fact that it makes him only one of a number of rival claimants for a doubtful honor, instead of leaving him in his splendid isolation as the greatest spiritual force of his century in England. It will always be a tempting historical puzzle to decide who was the strongest influence in the secular politics of England in the eighteenth century. It recalls what the Irish lawyer said of a knotty case—one would like to have a ten-pound note to argue either side. Mr. Birrell avers that "no man lived nearer the centre than John Wesley, neither Clive nor Pitt, neither Mansfield nor Johnson." Mr. Lecky attributes to Wesley a great, perhaps the greatest, single rôle in creating that bulwark of conservatism in the English masses against which the French Revolution was destined to break in vain. This attempt of Wesley's advocates, however, to secure for him the honor of "diffusing the Terror," will be regarded by many judicious historians as encroaching upon the peculiar prerogative of Burke. The late J. R. Green, for instance, casts his vote unhesitatingly for Burke. Speaking of the attitude of the English people towards the radicalism of the Revolution, he says that the fact that their "dislike passed slowly into fear and hatred was due above all to the impassioned efforts of Edmund Burke." But Burke is not Wesley's only rival. Carlyle tells us that "the last of the Tories was Johnson, not Burke, as is often said," and that "if England has escaped the blood-bath of a French Revolution, and may yet, in virtue of this delay, and of the experience it has given, work out her deliverance calmly, let Samuel Johnson, beyond all contemporary or succeeding men, have the praise for it."

Perhaps the strangest thing in the strife of these learned historical doctors is that while they differ *toto cœlo* as to the particular individual who averted the internal upheaval in England, they all tacitly agree in their major premise that such an upheaval was on the boards of fate for that particular season, and could be averted only by a moral miracle. One may be permitted to be a little skeptical about this tremendous assumption. In the past, the muse of history has failed to meet an exceptionally long list of appointments for whose certain occurrence the gravest historians have pledged their credit. At all events, if King George was rescued from the invisible guillotine by so great a number of moral paladins, it may be questioned whether he was ever in very imminent danger. And certain it is that John Wesley's true fame is beclouded and belittled when his mistaken friends attempt to see in him a saviour of society, rather than a noble servant of the Saviour of men.

THE WORK OF LEO XIII.

The interest with which the eyes of all Christendom have been turning to that venerable and pathetic figure in the Vatican is, of course, primarily personal. His is a marvellous individuality. None of the valiant old men of his generation—neither Gladstone nor Bismarck—made such a wonderful impression as has the latest of the Popes. It may, indeed, be doubted if any of those who had before worn what Dante calls the *gran manto* of the Papacy ever succeeded in captivating the imagination of the civilized world in the way of Leo the aged. At ninety he was able to astonish even a Frenchman, the painter Benjamin-Constant, by the brilliancy of his intellect. Yet with serene poise and strength he pressed on for three years more to his jubilee, retaining for twenty-five years that Papal power which, it was supposed, was given for only a short period to a feeble old man in 1878. Leo XIII.'s tenacity and vigor in old age make one credit the stories about that other strenuous nonagenarian of Italy, Dandolo.

But it is as the head of the Catholic Church that the wonderful Pontiff did the work by which he will be judged. As such, his achievements are memorable. Even those not in the Roman communion have freely admitted his greatness. Yet he had, of course, to use the tools which were put in his hands. Even his original and vigorous personality could not escape the limitations of his office, or fail to be moulded by the traditions of the great organization into which he was born and in which he labored so many years. It is said that when he was first elevated to the Papal chair he sent a special envoy to the excommunicated Old Catholic, Dr. Döllinger, with the message, "Come back, for there is another Pope." "Yes," answered the clear-sighted and resolute theologian, "but the same Papacy."

It still remains true, however, that a man of native power may, as Emerson said, assert himself freely even amid the oldest and mouldiest conventions; and Leo XIII. did so, as is confessed by all. Some of the dreams with which, it is said, he entered upon the Papacy were destined to remain unfulfilled. He aspired to restore the Holy See to its old position, as not merely the moderator, but the moving force, in the political life of the civilized world. In 'Italy of To-day' it is affirmed with much truth that the Pope was "more statesman than saint." His views, like his ambitions, were of the widest. His service as Papal Nuncio at Brussels gave him that stamp of the diplomat which never left him. In close touch with the affairs of many nations, his extraordinary memory, his fresh and curious interest in the ongoings of the world, made his comments often as picturesque as his counsels were shrewd. He was, wrote

the Marquis de Gabriac in his 'Souvenirs d'une Ambassade auprès du Pape Léon XIII.' "a man of his time."

High hopes of political innovations by the new Pope were entertained by many in the early years of his Pontificate. Attention was significantly called to the fact that, on his mother's side, he was descended from Cola di Rienzi. But the drops of revolutionary blood were well diluted by the time they reached the Peccis. The spectacle of a Radical Pope was not yet to be seen. It is true that Leo XIII. fronted the modern world with an attitude very different from that of his predecessor, Pius IX. He did not so obstinately struggle against a united Italy. He did not, in another *Syllabus*, include the democratic movement among modern errors. Leo endeavored to distinguish between the good and the bad in the civilization of his day. To republican government, when it was sane and moderate, he showed himself a good friend. Particularly to the French Republic were his services notable in attempting to conciliate Catholic opinion to the new order of things. His allocutions and pastoral letters were of high value, as French statesmen have been quick to acknowledge, in breaking down the old intransigeant spirit of the leading French Catholics, and in calling into being that very useful political party, the *Ralliés*.

In America the Pope seemed to take an especially vivid interest. It was not merely that the United States contain millions of Catholics. The social and political ferment of which this country is the large scene, appealed peculiarly to his statesmanlike habit of mind. He had, besides, special points of contact with this country. There was the controversy about the Knights of Labor. At first they fell under a quasi-condemnation by Leo XIII. Later, through the intervention of Cardinal Gibbons, the Pope came to a different view. Somewhat similar was his course in the famous case of Dr. McGlynn, condemned at first for supposed economic and social heresies, but afterwards restored to favor as an obedient son of the Church. To the subsequent controversy, apropos of the late Father Hecker, about a certain "Americanism" in the Catholic Church, it is necessary only to refer. In the encyclicals of the Pope on Socialism we see how his sympathy for the struggling and aspiring classes was balanced by his firm sense of the necessary order and stability of society.

"The press is a great power," said Leo XIII. to the Marquis de Gabriac. It was one of the proofs of his insight into the militant forces of his age. "Suppose we start a paper!" one of his Cardinals said to him, only half in jest. The Pope often dwelt upon the immense services which devout and able Catholics could render to both religion and the State through journalism. His own preference was for writing instead of speaking. His predecessor was a ready and fluent orator. He himself was the patient and accurate writer. His own ventures into literature have attracted much attention. There have been learned German articles on "The Pope as a Poet." To the very last he was applying the *labor limæ* to his Latin verses. In that we have a sign of the taste and restraint which marked his whole public life. His refined intellect, his simplicity of life, his unaffected piety, all exalted to eminence by his extraordinary career, have made him an inspiring personage even to those who will not mourn him as a spiritual ruler.

CHARLES OF LORRAINE.

PARIS, June 15, 1903.

A prolific writer, M. Lucien Perey, has just written an account of Charles of Lorraine and the court of Brussels in the reign of Maria Theresa. But little is known of the court of Brussels, which was a distant shadow of the court of Vienna. The daughter of Charles the Bold, the last Duke of Burgundy, brought the Low Countries as her dower to her husband, the Emperor Maximilian I. By the Pragmatic Sanction (1548), Charles V. added the seventeen provinces of the Low Countries to the crown of Spain. After many years of a momentous struggle, the treaty of Utrecht declared in 1579 the independence of the five provinces of Holland, Zealand, Utrecht, Gelderland, and Friesland. The republic of the United Low Countries was a century and a half afterwards governed by Prince Charles Alexander of Lorraine, the brother-in-law of Maria Theresa.

"This personage," says M. Lucien Perey, "deserves particular attention, as the work which he accomplished in forty years in the Low Countries with so much perseverance, intelligence and devotion is enough to mark him as a sovereign worthy of exceptional study. He pursued, during these long years, the most useful reforms, in a country which he had found nearly ruined, in which commerce, art, science had fallen so low as to have (so to speak) disappeared. After having commanded armies and having long contended, not without success, with the Great Frederick himself, the Prince showed as much ardor in reorganizing the Low Countries as he had shown in defending them. He strove against the ill will of the cabinet of Vienna, and protected the ancient customs and privileges so dear to the Flemish people. Maria Theresa herself did not always second him, and it was only after some years that she rendered him justice."

Charles Alexander of Lorraine was the twelfth child of Duke Leopold and of Princess Charlotte of Orleans, daughter of Philippe of Orleans and of Madame, his second wife, known under the name of the Princess Palatine and as the writer of letters which are justly considered among the most valuable documents on the time of Louis XIV. Madame had much to do with the education of Charlotte. She was a severe mother, and whipped her son, who became Regent, "so much that he still remembered it when he was twenty." The marriage of Princess Charlotte with Duke Leopold took place at Fontainebleau, and was celebrated again in Lorraine at Bar. The sons of Duke Leopold became associated with the destinies of the House of Hapsburg; we have to deal only with Prince Charles, who entered the Austrian service and fought against the Turks. He was in the front rank of the defenders of Maria Theresa in her struggle to defend her rights against Bavaria, Saxony, and the King of Prussia. In recompense for his brilliant services, Maria Theresa gave him the hand of her own sister, Marie Anne, and as the apanage of her sister the government of the Austrian Low Countries. The Archduchess was twenty-six years old. Maria Theresa could not make a better choice for her own interests; husband and wife were intimately attached to the imperial family by ties of kinship, and Charles of Lorraine served her whenever he was called upon to do so. As for his character, it was very well suited to the character and manners of the Belgians. The marriage was celebrated at Brussels on the 17th of January, 1744. Numerous festivities took place on this occasion in Vienna as well as in Brussels. The Prince de Ligne has left us a portrait of Charles of Lorraine:

"One of the finest souls I have known; a soul smiling upon everything. Good, lively, mild, gay, sensitive, quick, such was Prince Charles of Lorraine (brother of our good Emperor Francis), who was very near perfection. The frankness of his soul was painted on his forehead, and his obliging and contagious gaiety showed itself in a smile unaffected by years, neither by the smallpox nor by war, which had altered his beauty."

Prince Charles was hardly installed in his government when France declared war afresh against England and Maria Theresa (1744). The Empress, at the solicitation of King George, gave to Prince Charles the command of the allied armies. The Elector of Bavaria had been crowned Emperor under the name of Charles VII., and the King of Prussia had reappeared again on the battlefields of Europe. Charles's object was to cross the Rhine and to penetrate Alsace. He succeeded in his attempt, crossed the Rhine at two points, and established himself in Alsace with an army of seventy thousand men. His bold crossing of the Rhine was much admired by Frederick the Great, who celebrated it in bad verses in his 'Art de la Guerre':

"Rhin, ennemi, danger, rien n'arrête Lorraine.
Charles, en quatre corps, sépare ses soldats;
À l'endroit où Coigny ne s'y préparait pas,
Un pont construit soudain seconde son audace;
Il surprend les Français, et pénètre en Alsace."

Frederick sent a hundred thousand men into Bohemia, and Charles was obliged to recross the Rhine and leave Alsace. Very soon afterwards he heard the news of his wife's death following her confinement; she had been married only about a year.

The war continued in Germany. The husband of Maria Theresa was crowned Emperor at Frankfort on the 4th of October, 1745, and Prince Charles ordered a Te Deum to be sung in his army, in presence of the enemy. The Austrian cause seemed almost desperate after the victory of the French at Fontenoy and King Frederick's victory at Hohenfriedberg over Prince Charles. The French, under Marshal Saxe, became masters of Ghent, of Brussels. After a new defeat of the allies at Lawfeld, a Congress was summoned at Aix-la-Chapelle, and a treaty was signed on the 18th of October, 1748, which confirmed the election of the Emperor Francis, and gave back the Low Countries to Maria Theresa. For no less

than two years Louis XV. had possessed them, and Maurice of Saxony had been their Governor.

The return of Charles of Lorraine was awaited with great impatience, as he was very popular. He made his entry into Brussels on the 23d of April, 1749, and had a triumphal reception. The Prince, in an

"allegorical chariot drawn by six horses richly adorned, was surrounded by fauns and sylvan deities. On the two sides were seen the River Elbe and the River Danube, with flowing locks and great urns; and Victory kept them chained at her feet. The rest of the cortège was in unison, and all these mythological personages in the midst of hussars and soldiers formed surely the most grotesque assemblage that could be imagined. The Prince was received in a similar manner at Antwerp, Malines, Namur, and Luxembourg. It is difficult to imagine such scenes occurring at Paris or at Versailles without their provoking the laughter and pleasantries of the crowd; but these little facts make us well understand the difference of manners which can exist between two neighboring nations. We have often been struck in our researches by the marked opposition which exists between the ironical spirit of the French and the *bonhomie*, often a little heavy but always good-natured, of the Belgians."

Charles was adored by the Belgians; he respected all their ways and manners; he mingled with all classes of society. He was in active correspondence with Maria Theresa, and gave her an exact account of all the details of government. In 1757 Maria Theresa recalled the Prince and confided to him the mission of defending Bohemia against Frederick of Prussia, her inveterate enemy. Charles left at once for Bohemia, where he joined Marshal Daun. Frederick had an army of nearly a hundred thousand men; Charles had under his direct command but fifty-five thousand. The Imperial troops were defeated; Daun had to retreat, and Charles retired to Prague with his part of the army.

Frederick began the siege of Prague, which lasted forty-two days, at the end of which period Marshal Daun reappeared and fell upon the Prussian lines. Charles made a great sortie, attacked twenty thousand men commanded by Marshal Keith, forced them to retire, and made his junction with Marshal Daun. Prague was delivered. In memory of the joint victory over the King of Prussia, Maria Theresa instituted the order which bears her name.

The military career of Charles of Lorraine had come to an end. After his return to Brussels, the Prince gave himself up completely to the administration of his provinces. M. Lucien Perey has gathered many documents on the court of Brussels, the household of the Prince, his amusements, his palaces, his collections. At that time Brussels was a sort of little Paris, as it is now. In 1780, Charles was, as usual, at Tervueren, with his court; he fell ill, and, to the astonishment of all, he asked for the last sacrament. He was able, a few days afterwards, to chase the boar in the park, but he fell ill again and his malady assumed at once a very grave character. Three days before his death he wrote two lettters, one for the Empress Maria Theresa, the other for her daughter, the Archduchess Marie Anne, which he ordered to be sealed in black. His body was brought back to Brussels and exposed to view for three days in the uniform of the Teutonic order—black clothes, white cloak, with boots and spurs. Curiously enough, it was from the mouth of the King of Prussia, whom Charles of Lorraine had met so often on the battlefield, that the Prince de Ligne learned the news of Prince Charles's death. "If you have to learn the death," said Frederick to the Prince de Ligne, who was his guest at Potsdam, "of a man who loved you and who honored humanity, it is best that it should be from one who feels it so keenly. Poor Prince Charles is no more." Upon which the King spoke at length of his former enemy: "His crossing of the Rhine was a very fine thing, but the poor Prince depended on so many people; I have never depended on anything but my own head. He was not well served, not enough obeyed; this has never happened to me."

Maria Theresa did not long survive her brother-in-law; she died five months after him, on the 29th of November, 1780.

Correspondence.

CONSTITUTIONAL GOVERNMENT AND THE ALTERNATIVE.

To the Editor of The Nation:

Respected Friend: A few days ago one of the most conservative and influential newspapers in Pennsylvania had an editorial on the Fifteenth Amendment, in which occurs the following statement:

"Some two months ago the *Public Ledger* let drop a casual, though not unconsidered, word on the subject of the Fifteenth Amendment. It ventured to commend the justice and wisdom of a recent decision of the United States Supreme Court which refused to give relief to a negro seeking in Alabama the suffrage denied him by the Constitution of that State. This journal expressed the belief that the country now looked upon the Fourteenth and Fifteenth Amendments as measures of uncertain wisdom, and that it now seemed disposed to let the States chiefly interested in the negro problem determine the qualifications each of its own citizens, and held that, this conviction having become so prevalent as to constitute a sort of unwritten amendment to the amendment to the Constitution, it was a proper function of the Supreme Court to give it the form of law."

I understand that the decision of the Supreme Court, to which the editorial refers, was based on an alleged lack of jurisdiction over the case as presented; that it did not reach the basic principles of equal suffrage as defined in the Constitution, and hence gives no trustworthy indication of how the Court would treat a different presentation of substantially the same issue. This being so, the importance of the decision may easily be exaggerated, and criticism of the Court on that score had best be suspended.

It also seems pertinent to notice that neither of the amendments in question prohibits any State from determining the qualifications of its own voters, but only from making flesh of one citizen and fowl of another. But the above expression of judgment, by one of the most carefully edited newspapers in the United States, is of peculiar significance as exemplifying an insidious drift of respectable public opinion away from the fundamental principles of law and order. We have been taught by our fathers, and by common sense also, that the purpose of a constitution is either to protect the mass of the people from the despotic rule of a small governing class, or to protect the minority from the despotic rule of the majority; and that the sole function of our Supreme Court is to maintain our whole system of Government and jurisprudence in conformity with the Constitution. In other words, the sole function of the Supreme Court is to perpetuate constitutional republicanism and to prevent our system of government from evolving into an oligarchic despotism. But now it is being proclaimed by the most influential and respectable leaders of public thought that the function of the Supreme Court is to give the form and force of law to what a majority of the nine judges may conjecture is the present desire of a majority of the people. It is obvious that if the Supreme Court is at liberty to add an "unwritten amendment" to the Constitution, and to give such "unwritten amendment" the "form of law," the Constitution itself at once becomes a mere nose of wax, and any five judges of the Supreme Court are empowered to transform this republican Government into an oligarchic despotism—the very thing for the prevention of which the Supreme Court was established.

The power to substitute "unwritten" law for the written law is the power to nullify the written law; and to permit the Supreme Court to assume such power practically transforms the judges into absolute dictators, and virtually destroys constitutional government. And remember, these judges are appointed by the President for life, and are not elected by the people. In giving the form and force of law to "unwritten" law, they would not represent the majority of the people, much less the nation as a whole, but at best they would set up a system of "unwritten" law based on their own surmises as to what the majority want. And from "unwritten" law based on surmises as to the desires of the majority of the people it would be a very short step to "unwritten" law based on the desires of the judges or of the judges' masters. Instead of being the most independent tribunal in the world, and the farthest removed from temptation—the protection of the weak and the minority, and the incorruptible bulwark of our free institutions—as it was intended to be, the Supreme Court would be transformed into a machine for the manufacture of sophistry for the nullification of the Constitution, and would soon become the most effective shield for the rule of a tyrannical oligarchy ever devised even by kingcraft.

The rule of the majority of the people regardless of law is mob rule; and when the judges of our courts base their decisions on the supposed desires of the majority—or on "unwritten" law as a substitute for the written law—they are undermining popular respect for the written law, and doing what they can (unwittingly, of course) to encourage lawlessness, which in its last analysis is the rule of the mob. And with the rule of the mob, in the natural course of events, the "man on horseback" appears upon the scene.

Isaac W. Griscom.

Philadelphia, 7th mo., 3d, 1903.

"DEBASEMENT OF THE SUFFRAGE."

To the Editor of The Nation:

Sir: Mr. E. L. C. Morse of this city, in the *Nation* of June 25, illustrates what his

"better classes of the community" are pleased in their languid way to regard "The Debasement of the Suffrage" by an incident from his own experience at the late judicial election here. Mr. Morse reports an interview in a drug store at South Chicago, while the election was in progress, with "the owner of the store, a real-estate man, a railroad agent, a bookkeeper, and a physician." It seems that these citizens declined to go three blocks to vote to fill fourteen judicial posts, because, as Mr. Morse reports, they in effect said: "What is the use? We shall be swamped by a gang of Poles, Hungarians, and yawps that can't speak English, don't understand the system of government, and vote just as they are told to vote by their boss," etc.

Your correspondent, had he studied the returns of the election named, would have been less troubled by the abstention of his representatives of "the better classes" from voting. Indeed, in view of the result of that election, to say nothing of repeated demonstrations in recent years of independent voting here, his "voters of light weight and dubious intrinsic value" seem to have taken themselves off without waiting the uncertain movements of our statesmen.

The election in question was held to fill our entire circuit bench, there being twenty-eight candidates for fourteen judicial positions. It is held every six years on June 1, to avoid political complications. The Republican ticket was headed by Judge Hanecy, who was a candidate to succeed himself. Judge Hanecy, while in office, ran for the nomination of his party for the Governorship of Illinois, and was its candidate for the Mayoralty of Chicago. He was widely regarded as a dangerous man for judicial service. He was repudiated by the bar primary, held after the party nominations were made, and by the entire independent press. The party machine did its utmost to reëlect him. His leading Democratic opponent, the venerable and beloved Judge Tuley, was strongly supported by the bar and the independent press. Judge Tuley and all but two of those thus supported were triumphantly elected, most of them by overwhelming majorities. The story is told by the totals of the votes cast for the leading candidates. Judge Tuley received about 108,000, Judge Hanecy about 63,000 votes. Of twenty-eight candidates, Judge Hanecy stood third from the foot of the poll.

The vote of the Eighth Ward is significant. In this ward is situated South Chicago. Here reside Mr. Morse's choice representatives of "the better classes," who regarded themselves above voting with the plain but intelligent men, of many nationalities, who man the steel works and other great industrial plants in that industrial section of the city. The ward is Republican on national issues. Yet Judge Tuley received 60 per cent. and Judge Hanecy but 40 per cent. of the vote cast. In view of this splendid response by a "lot of cattle" in South Chicago to public-spirited leadership, Mr. Morse's illustration should cause the friends of good government elsewhere no serious uneasiness about the "debasement of the suffrage" here.

We shall no doubt continue to have among us those who shrink from mingling with plain people even at the polls. While others lead a successful struggle to maintain representative government, they will quietly long for a restricted suffrage which is as impossible as it is undesirable. The truth is, that we have no reserve of intelligence or of virtue upon which to fall back or rely. The cure for the ills of democratic government is not to be found in less, but in more democracy.

Yours very truly,

EDWIN BURRITT SMITH.

CHICAGO, July 1, 1903.

THE SCIENTIFIC IMAGINATION.

TO THE EDITOR OF THE NATION:

SIR: In the recent newspaper discussion of the hypothesis of Sir William Crookes, Sir Oliver Lodge and others, concerning the constitution of matter, I have been quoted occasionally as a somewhat scornful opponent of the new ideas. Since these reports by no means represent the subject in a true light, I venture to write this letter in order to correct the misunderstanding.

A quotation from Sir William Crookes's article, which is now accessible to all in the issue of *Science* for June 26, will perhaps most easily clarify the case. He says:

"Indulging in a 'scientific use of the imagination' and pushing the hypothesis of the electronic constitution of matter to what I believe to be its logical limit, we may be, in fact, witnessing a spontaneous dissociation of radium, and we begin to doubt the permanent stability of matter. . . . It must never be forgotten that theories are only useful so long as they admit of the harmonious correlation of facts into a reasonable system. . . . Are we not incessantly learning the lesson that our researches have only a provisional value? A hundred years hence, shall we acquiesce in the resolution of the material universe into a swarm of rushing electrons?"

The conditional statement and frank interrogation, appearing in this final climax of his, place him in a very different position from that to be inferred from the daily papers. Here is no claim to a great discovery, but merely the statement of the possible consequence of pushing an avowedly hypothetical inference to its logical extreme, with full recognition of the likelihood of its fallibility. With such an attitude no reasonable person can quarrel. The hypothesis that the hypothetical atom is divisible—and this is the particular proposal which has caused so much excitement—is, indeed, not unreasonable; but it is not the only possible explanation of the facts. In view of this circumstance, and also of the very recent discovery and the surprising nature of some of the phenomena concerning radium and the Röntgen rays, it seems to me premature to own unswerving allegiance to any definite interpretation at present.

The popular discussion of this question, as of so many scientific questions, has been much confused by the inability of many writers to distinguish between fact and hypothesis; and it was against this confusion that I argued in the interview which led to the exaggerated report. Facts are determined by observation and experiment, and their truth depends only upon the accuracy of the observation and experiment. Their discovery is a lasting addition to the knowledge of mankind. On the other hand, hypotheses are attempts to interpret the facts; and many hypotheses, from their very nature, can never be proved. Although usually transitory, they are often very useful in suggesting further experimentation; but they become dangerous when mistaken for realities. Faraday, one of the greatest of scientific discoverers, dreamt many such scientific dreams; they were his leading inspiration, and they never harmed his work because he always recognized their true place. In the same way, these new inferences concerning the reasons of the remarkable behavior of radium may be highly suggestive and therefore valuable, if their inevitable limitations are always borne in mind.

I am, sir, yours very truly,

THEODORE WILLIAM RICHARDS.

PETERBORO', N. H., July 2, 1903.

THE FROUDE AND CARLYLE CONTROVERSY.

TO THE EDITOR OF THE NATION:

SIR: Is not this Froude and Carlyle dispute a specimen of the growing disregard of privacy and delicacy under the influence of sensationalism which is a rather unpleasant feature of our marvellous generation? A man of the old type, having such papers bequeathed him, might have been apt, on his return from the funeral, to put them into the fire.

Mrs. Carlyle must, I cannot help thinking, have been extremely sensitive if she could fancy that Lady Ashburton intentionally slighted her or did anything to hurt her feelings. Lady Ashburton was a queenly sort of woman, a great lady, perhaps one of the last of that race. But her heart was as kind as her wit was bright. She showed no pride of rank, and was anxious to make everybody happy. Carlyle, as his letters show, adored her, and she was an intense admirer of the writings of Carlyle. Mrs. Carlyle's gifts, since displayed in her letters, had not then been revealed.

Froude was a man of genius and a most fascinating writer. But, without impeaching his integrity, it may be said that he had a vivid imagination. As a writer of travels, he astonishes the natives of the countries by some of his descriptions. As an historian, he can make a pure and beneficent hero of Henry VIII.; see reforming genius embodied in Thomas Cromwell; take the Statutes of Laborers for records of impartial arbitration between classes, Tudor Parliaments for independent assemblies, and an adulteration of the coin for a loan from the mint. In his treatment of the characters of Thomas More and other victims of Henry VIII., to whose murders he wishes to reconcile us, there is an apparent artfulness which it is charitable to set down to the influence of the same luxuriant fancy.

Froude was evidently impressible, and he underwent the influence of two men, both of genius, but neither of them safe as an ordinary guide. John Henry Newman, with whom Froude collaborated in the 'Lives of the English Saints,' thought and taught upon the principle that what was good for you to believe must be true. The 'Grammar of Assent' is a mental apparatus constructed under the influence of that principle. Carlyle's genius was

splendid. He gave history a fresh life, and he probably did Democracy good by snubbing it. But who would take the hero-worshipper for a practical guide? What can be more monstrous than the moral paradoxes of his 'Frederick the Great'? You could not be in Carlyle's company for a day without seeing that his cynicism and pessimism were unmeasured.

One evening at "The Grange" we came out after dinner on the lawn. A glorious moon met our eyes. There were a few moments of pensive silence; then a voice was heard exclaiming "Puir auld thing!" We were left to guess whether the moon was "puir" in herself or because she was doomed to look down upon vile humanity.

It was at that time, if I remember rightly, that Tennyson was one of the circle at "The Grange." He was asked to read one of his own poems aloud, which he was supposed to be not unwilling to do. To the general surprise and disappointment he refused. Looking across the room, I saw the cause of the difficulty. Close to Tennyson was Carlyle, who had not failed in the universal sweep of his philosophy to pass an opinion upon poetry in its relation to common sense. Devoting myself to the public good, I went across and invited Carlyle to a stroll in the grounds. He accepted the invitation, and while we strolled the reading came off. This little incident, which I had totally forgotten, was recalled to my memory not long ago by a writer in a London paper; so that, though forty-six years have passed since I received Lady Ashburton's last message of farewell, there is probably at least one member of that circle besides myself still alive to bear testimony to the character of its hostess.

GOLDWIN SMITH.

TORONTO, June 30, 1903.

THE ETHICS OF BOOK-MAKING.

TO THE EDITOR OF THE NATION:

SIR: Last winter I subscribed to the new edition of the 'Encyclopædia Britannica,' issued by the London *Times*. It was promised to consist of thirty-five volumes; and when the first thirty had been received, I had a bookcase made especially for it. Recently, volumes 34 and 35, containing the Atlas and the Index, came, and proved to be nearly an inch higher than the other thirty-three volumes. As I had measured close for my bookcase, they do not fit the shelves; but whether they fitted or not, what right has a reputable concern to issue without warning two volumes in a large set which do not match the others?

The agent informs me that the great bulk of material caused the increase in size, and that these volumes are particularly fine. As to the excellence of the whole work there is no question; but what has excellence or defect to do with uniform size and binding? If you subscribe to any complete edition of Scott or Thackeray, or to an encyclopædia, have you not the right to expect uniformity? How would the subscribers to the Oxford Dictionary feel if they were to receive now a quarto, and now a folio, or smaller section?

In this case there seems to be no redress, as the harm has already been done. I write to warn those who have not already bought the 'Britannica' what they have to expect, and, still more, to impress on publishers that they are under a moral obligation to commit no such surprises as this.

WILLIAM ROSCOE THAYER.

CAMBRIDGE, MASS., July 2, 1903.

Notes.

A 'Reader's History of American Literature,' by Thomas Wentworth Higginson, is in the press of Houghton, Mifflin & Co., and a Life of Henry Ward Beecher by Lyman Abbott.

'American Railways,' announced by Macmillan Co., is a reprint of letters to the London *Times* by their special commissioner, Edwin A. Pratt.

Jacob A. Riis is at work on a new book, 'Theodore Roosevelt the Citizen,' for the Outlook Co.

Kipling's new volume of poems to be published by Doubleday, Page & Co. will bear the title 'The Five Nations.'

James Pott & Co. will bring out 'The Tail of the Peacock,' personal experiences in Morocco by Miss Isabel Savory.

We have already called attention to the inclusion of the *princeps* of the Authorized Version, 'The Tudor Bible,' among Mr. David Nutt's notable "Tudor Translations," as pure literature. The second and third volumes are now to be had (Judges to Esther, Job to the Song of Solomon), and three more are to come before Christmas. "A terminal essay" is promised by Mr. William E. Henley, the editor of the series. Typographically, this is one of the most rational and attractive reproductions of the Bible. Six hundred copies, in this case as with the other "Tudors," constitute the edition.

The 'Annual Register' for 1902 (Longmans) is the close-packed repository that it has so long been; strongest and fullest in its review of English history for the year, but omitting no considerable quarter of the globe. Four writers have had in charge the two Americas, and the United States has been well looked after. The daily chronicle of events succeeds, and then comes the usual retrospect of literature, science, and art. An extensive obituary and index conclude this valuable book of reference.

Ginn & Co., Boston, publish for the International Union a selection of 'Discourses on War,' by William Ellery Channing, with an introduction by Edwin D. Mead. The range includes both abstract presentations of the theme and the famous letter on the annexation of Texas. The discourses proper are truly such, of the pulpit, argued on Scriptural and Christian grounds; remarkable for want of graphic power in depicting the horrors of war; never quite going to the bottom of the subject. They lack both relief and vigor. An hour with Tolstoy's 'War and Peace' or with his Sebastopol sketches would leave a far more vivid impression, and perhaps enforce the moral more securely. Still, Dr. Channing's humane teachings can but do good wherever read. Mr. Mead has done well to quote entire a memorial to Congress drafted by Channing some ninety years ago, praying for a universal pacific declaration on the part of the United States, and the establishment of a tribunal for the settlement of international disputes without resort to arms.

The New London County (Conn.) Historical Society, upon undertaking some Occasional Publications, has resorted to the Norwich Free Academy Press, a unique branch of secondary education in this country so far as we are informed. 'The Stone Records of Groton,' edited from the manuscripts of the late antiquary and historian, Miss Frances Manwaring Caulkins, by Miss Emily S. Gilman, is a comely volume highly creditable to the Academy's pupils, of both sexes, who executed all the printing and illustrations, as well as the binding. The title of the book fits best the collection of gravestone inscriptions (with pen-sketches of the stones); but there are also chapters on Mason's expedition against the Pequots, and the traitor Arnold's against New London.

The twenty-second volume of the New Jersey Archives, 'Documents relating to the Colonial History of the State of New Jersey,' is edited by William Nelson, and consists of Marriage Records 1665-1800. For the counties of Bergen, Hudson, and Essex they are exhaustive so far as the material is extant; but much has perished. These church records succeed a transcript of the index to the marriage records in the office of the Secretary of State at Trenton. Mr. Nelson's learned introduction reviews in upwards of a hundred pages the early marriage laws of New Jersey, with excursions into New England, New York, Pennsylvania, etc. There are fourteen distinct alphabetically ordered lists. That for males of the Friends gives also some of the witnesses to the ceremony.

The fourth in "Appletons' Series of Historic Lives" is Sir William Johnson, by Augustus C. Buell. Of perennial interest is the story of the young Irishman, who became a great landowner, a successful general, one of the few American baronets, and finally Superintendent for the Crown over all the Indians east of the Mississippi. Mr. Buell published two years ago an excellent life of Paul Jones; it is regrettably evident that this book cannot be placed in the same class. Of Johnson two excellent biographies already exist, the standard 'Life of Sir William Johnson,' by Stone, and the more recent 'Sir William Johnson and the Six Nations,' by Griffis. Little of importance is added by the present work, and that little is not always well authenticated. Those who are already familiar with the times and events mentioned may find some pleasure in reading a new version, but the hasty and careless way in which the book seems to have been put together prevents its acceptance as an authority or even as a convenient popular account.

S. R. Gardiner's 'History of the Commonwealth and Protectorate' was nearing completion at the moment of the author's death. At least, three volumes had been finished, and something had been done towards the preparation of a fourth volume which was to have concluded this splendid series of works on the early Stuart period. However, the only portion of the final instalment that Mrs. Gardiner and Mr. Firth have thought it proper to print is a single chapter entitled 'The Parliamentary Elections of 1656.' This fragment is now published by the Longmans as a supplement to

volume iii. rather than as the beginning of volume iv. It is marked by the same qualities of thoroughness and impartiality which are so closely associated with Gardiner's name and have given his writings their standing as preëminent authorities for the times of James I., Charles I., and Cromwell.

'The Correspondence of Lady Burghersh with the Duke of Wellington' (Dutton) is now published, though with some diffidence, by her daughter, Lady Rose Weigall. The reason for publication is that the letters display the Duke's kindliness towards those of his family and of his intimate circle. The ground of the editor's diffidence is that the correspondence is one of domestic rather than of public interest. The book supplies a striking commentary on the Duke's character, illustrating his undoubted fondness for the society of ladies, and also the warmth of his geniality where personal friends were concerned.

Canon Rawnsley's 'Lake Country Sketches' (Macmillan) is the sixth volume of his contribution to the subject of the Lakes and Lake poets. It is prefaced with the usual sonnet, and contains some pages of the writer's original verse. The longest essay is on "Wordsworth and the Peasantry," and describes exhaustive interviews with the "lad whose wont it was to serve the Rydal Mount kitchen with meat"—the butcher, in fact; with the "one-time gardener's lad" and the "page or butler's assistant." Hence we learn that Wordsworth had "an antipathy to veal," was extremely unpopular with the peasantry, and finally that a whole countryside of aged dotards, spurred by Canon Rawnsley to remember or invent, rank his poetry and his personality a good way below the achievements of Hartley Coleridge. For collecting the greatest number of Wordsworthiana in a single country walk and for composing sonnets about them, Canon Rawnsley holds the record. He is now, in the matter of production, neck and neck with Boswell, and shows no signs of giving out. But, for his readers, the eighteenth century will always retain the incalculable advantage that Boswell was no poet.

The 'Album-Kern,' published last April in Leiden in honor of the well-known Dutch Sanskritist, contains three papers not likely to fall under the eye of Greek scholars, though in their sphere of interest. The first two are grammatical, on the history of the Greek participle and of the Greek passive aorist (the latter *contra* Wackernagel). The third is a far-reaching etymology of Sophus Bugge, who derives *Olympus* from Anatolian *olun-kh* (λόφος, *dorsum*), and thence concludes that Thessaly was originally settled by tribes that did not speak Greek, but were related to the Armenians.

The Bulletin of the American Geographical Society for April notes the new limitation of the words hydrography and hydrology proposed in connection with the reorganization of the hydrographic branch of the Geological Survey. The two words are no way distinguished as to subject-matter by etymology; but the usage in the dictionaries seems rather to make hydrology the general word, referring to the properties of water, its laws, etc., while hydrography discusses the distribution of water as a part of the terraqueous globe. In the encyclopædias, however, hydrology holds little place, and the tendency is to make hydrography cover the whole subject. It is now purposed to confine hydrography to the discussion of surface water, while hydrology will imply the study of underground water resources; and so the irrigation laws of the West make necessary (?) a new term in science. Prof. Israel C. Russell writes of "Geography and International Boundaries," and comments on the advantages which subjects would gain if statesmen had geographical experts at their elbows when the problem was to lay down boundaries of countries in treaties and other settlements.

In the *National Geographic Magazine* for July Mr. H. W. Wiley of the Agricultural Department gives some interesting facts about our soils and their products. It appears that the money value of the corn crop is nearly twice that of hay, the next in value, cotton, being the third. There are nearly six million farms, worth a little more than twenty thousand million dollars, of which almost two-thirds are cultivated by their owners. Mr. Wiley makes no question that, by the application of scientific principles to agriculture the food supply will keep pace with the increase of population. "When in a hundred years from now we are feeding two hundred million people, the quantity of food per head will be no less abundant than at present." Some striking illustrations of Western farming scenes accompany the article.

The great geographical enterprises of the reign of Queen Elizabeth are commemorated in the *Geographical Journal* for June, in connection with the tercentenary of her death. Sir Walter Raleigh's achievements are described by Edmund Gosse, who regards him "as the most splendid example of the geographer and patron of geographical literature who approaches his science in the pure light of imagination." Sir Francis Drake's greatest glory, according to Julian Corbett, was the discovery of Cape Horn, named by him after his beloved mistress "Cape Elizabeth." Upon this alone he dwells, giving an interesting explanation of the mystery which for a time shrouded "one of the four great discoveries of the world." Prof. S. P. Thompson tells of William Gilbert, who, in his monumental work 'De Magnete,' "laid the foundations of terrestrial magnetism and of the experimental science of electricity." Sir C. R. Markham briefly narrates the exploits of the other leading explorers of that time. Of the remaining contents are a geological illustrated description of Charnwood Forest, "a buried Triassic landscape," and a study of the cartography, with maps, of Spitzbergen, by Sir Martin Conway. An account of Basutoland, the Switzerland of South Africa, is suggestive as showing the development of practical enterprise on the part of the African native. "Following the road south [from Maseru, the capital] to the southernmost border, you pass through almost one continuous stretch of maize, wheat, oats, or sorghum, according to the time of the year. No sooner is one crop out of the ground than another is put in."

Petermann's Mitteilungen, number five, opens with a study of the volcanic region of the Southern Andes, which consists mainly in giving the positions and heights of the different volcanoes. One hundred and seventy-two of these are designated on the accompanying map. Dr. A. Eichhorn contributes two sunshine-charts for Germany, for the whole year and for the winter, with notes, from which it appears that the cloudiest region is in Thuringia and the sunniest in Baden and eastern Prussia. The longest article in the number is an account of a work published by our Government in 1900 giving the latest scientific facts, etc., collected by the Jesuits in the Philippines. It is characterized, next to Blanco's Lexicon and Flora, as "the weightiest and most important publication on these islands in the Spanish tongue of the last century."

The two newest sheets in the large-scale reissue of the New Jersey State Atlas by the Geological Survey show but a minimum of the State's territory, which, in the Shark River sheet, divides about equally with the ocean, and extends along the shore from Deal Lake to Manasquan, while the New York Bay sheet admits only Bergen Point (Greenville to Constable Hook). Staten Island and Long Island furnish most of the land surface. The activity of the Survey is further illustrated by the appearance of the third volume, 'The Palæozoic Faunas,' of the Report on Palæontology, by Stuart Weller, Ph.D., and the fifth volume of the Final Report of the State Geologist, being 'The Glacial Geology of New Jersey,' by Prof. Rollin D. Salisbury, with the collaboration of Dr. Henry B. Kümmel, Charles E. Peet, and George N. Knapp. The former volume is strictly technical, and is illustrated by 52 plates. Prof. Salisbury, on the other hand, prefaces his discussion with a general survey of glacial processes and phenomena which the layman will find lucid and informing. The volume, of nearly 800 pages, is plentifully supplied with illustrations and maps.

An 'Analytical and Topical Index to the Reports of the Chief of Engineers and Officers of the Corps of Engineers, United States Army,' in three volumes, covering the period from 1866 to 1900, has been published. It has been compiled under the direction of Lieut.-Col. C. W. Raymond by Mr. John McClure, assisted by Mr. E. L. Stratton, jr. In this index is incorporated the material contained in the three index volumes published in 1881, 1889, and 1895, respectively. Volumes i. and ii. are devoted to "River and Harbor Works," Volume iii. to "Fortifications, Bridges, Laws, Miscellaneous, and Topical Index," and contain many references not included in the previous volumes.

In his account of 'The Geology of Kalahandi State,' published in the Memoirs of the Geological Survey of India, Dr. T. L. Walker briefly describes the inhabitants of this little-known region. There are two distinct peoples, the Hindoos and the Khonds. The former inhabit the plain which forms the northwestern half of the State. They speak Uryia and are perhaps of Aryan descent. The Khonds, who live on an undulating plateau in the southern part of the State, are aborigines who devote themselves to agriculture and the collection of forest products. They are only very slightly influenced by the doctrines of their Hindoo neighbors, and seem to be but little behind them in civilization. The Khond is light-hearted and shy; his great virtue is truthfulness, his vice drunkenness. Geologically, Kalahandi is made up of non-fossiliferous rocks, chiefly crystalline schists and transitions.

We note the formation of "The Morris Society" in Chicago in May last, having for its objects some commemoration of William Morris's life, as in the publication of his collected writings in special and in popular library editions, together with essays interpretative of his work as writer, craftsman and social reformer, or akin to it in spirit and tendency, and also permanent clubrooms in Chicago for a centre of propaganda. Particulars may be had of the secretary, Oscar L. Triggs, No. 5634 Madison Avenue, Chicago.

—Dr. Franklin B. Dexter's great task in emulation of Sibley's 'Harvard Biographies' now completes the parallel in number of volumes. The third of his 'Yale Biographies and Annals' (Henry Holt & Co.) covers the period 1763-1773, midway in which President Clap's resignation was at last brought about, and an effective hold secured on the General Assembly's annual bounty (through the import duty on rum and otherwise). At the very close, President Stiles appears upon the scene, and Dr. Dexter's familiarity with his diary and personality warrants deep regret if this series is not to be continued, for want of time and strength, over Dr. Stiles's incumbency, so much would the Annals prefixed to the biographies of each class be enriched; and it is largely in them that we find the savor of the decade under consideration in the present volume. Thus, for the college year 1772-73 a formal commencement debate is recorded on the "advanced question" "Whether the Education of Daughters be not, without any just reason, more neglected than that of Sons?" And the future Gov. Oliver Wolcott, jr., is cited for a description of gownless freshmen "in the yard" (not yet *campus*) made to fag, out of study hours, as "waiters or servants to the Authority, President, Professors, Tutors, and Undergraduates." Yet already, five years before, the alphabetical arrangement of the catalogue of each class had superseded that according to social rank. Dr. Dexter is at pains to set down the traces of an early anti-slavery conscience. For example, the Rev. Ebenezer Baldwin's newspaper essays, "Observations on the Slavery of Negroes and on Slavekeeping" (1773-4), though twelve years behind John Woolman's "Considerations on the Keeping of Negroes," "took what was at that time advanced ground in condemnation of slavery." The Rev. Elam Potter and his classmate, Judge Theodore Sedgwick, were also in the same honorable company, in benevolent feeling and action at least. To be remarked, further, is the mortality of wives, and the proneness, especially among the clergy, to triple marriages. One feels the westward migration from the coast to interior New England, to Wyoming (Pa.), to Western New York, to Ohio. Manasseh Cutler, class of 1765, is one of the leading names in this section. Others are Jared Ingersoll, the much-married Dr. Nathanael Emmons, Judge John Trumbull (author of 'McFingal'), President Timothy Dwight, and Gen. Hull. Few are the graduates regarding whom something has not been gleaned, even if as meagre as William Giles's inventory—a suit of clothes and nine books. On but one is the biographer's censure loosened unreservedly, the "infamous" Rev. Samuel Ely, fomenter of Shays's rebellion. Dr. Dexter's performance is consistent, accurate, and authoritative, highly to be praised in every respect, especially for the bibliographies. A pious complement to his labors would be an album of portraits of his graduates. He notices them wherever he can; many exist in printed works, and Yale owns not a few. They should be got together.

—The 'New Letters and Memorials of Jane Welsh Carlyle,' recently noticed in these columns, have called out a posthumous Froude counterblast, 'My Relations with Carlyle' (Charles Scribner's Sons). This pamphlet of some eighty pages is introduced and explained in a "prefatory note" by Ashley A. Froude and Margaret Froude, who say that as Mr. Froude's representatives they feel bound, after the 'New Letters,' to use what means they possess to vindicate his memory. They accordingly give to the world Froude's own account of his relations with Carlyle—pencil notes, written in a note-book, and, so far as is known, shown by him to no one. Some pages are omitted as being of "too intimate a nature to be given to the public," but the gist of them appears in a condensed form, the narrative being continued and concluded in Froude's own words. The notes were written in Cuba in 1887, and there is appended to them an elaborate letter from Sir James Stephen (coexecutor with Froude of Carlyle's will) to Froude, written at the latter's request, and giving the writer's account (it is intended as a justification) of Froude's "connection with the papers of Mr. Carlyle which formed the materials" of Froude's publications. Carlyle's will is also given in full. The story embodied in the letter is long and intricate, but Froude's own *apologia* is simple enough. It amounts to a reiteration of the original Froude view of Carlyle's character and relations with his wife, with "new matter" tending to reinforce that view. Some of this will be thought by many of "too intimate a nature to be given to the public," for it is unfit for public discussion and comment. It raises questions as to which even courts of justice prefer to take evidence with closed doors. We can hardly see how any injustice done to Froude, even as estimated by his representatives, could palliate the production by them of such details, assuming them to be true.

—But, apart from this, there are points connected with the publication which can perfectly well be discussed. As a whole, the pamphlet deepens the impression which the original books left, that Froude's manner of discharging his trust, satisfactory as it may have been to his coexecutor, had a most malign effect on the reputation of the man whom he regarded as his master and teacher. This may have been an editor's misfortune, but it is no reply to say either that it was not intended, or that it was Froude's duty as biographer not to suppress the truth. By comparing the revelations made in this pamphlet with the original publications, it will be seen that a great deal *was* kept back, as unnecessary to a correct picture; this is now published, it must be supposed with Froude's conditional ante-mortem assent, not to correct the portrait, but in retaliation for criticism of the biographer. The capital fact that Froude, the chosen disciple, blackened his teacher's reputation, would have been much better met, to our mind, by a display of that spirit of remorse of which the teacher himself showed himself so lavish over his wife's grave. It is a bungler who meets it, either by saying, "Why, I have not told you half," and proceeds to lay on some additional touches, or who insists, as Froude also does, that he was the last person who should be suspected of having wilfully misrepresented Carlyle's character, because he revered him so deeply. It was the effect of his biography that was quarrelled with, not his original intention. Then there is the question of Froude's own accuracy and even veracity. He does not meet this by admitting that his book was full of "printers' blunders" or "errors of the press." It was with his own blunders and errors that fault was found. The most important point made, perhaps, is, that, in the opinion of Sir James Stephen, Froude dealt as to pecuniary matters in an honorable and liberal way with Carlyle's representatives; but no point in the whole controversy has aroused less general interest than this. In the end we are left where we began: the chosen disciple has given us a picture of his master as a boorish if not cruel husband, an irresponsible dealer in invective and execration, whose old age was saddened by a remorse so profound as to suggest a hopeless sense of unexpiated wickedness. Froude's mistake was in supposing that the congregation would throw up their caps in delight over such a portrait of their pastor. The present publication makes it seem as if the biographer had been wholly insensible to what he had done. But *litera scripta manet*, especially in the case of writing as vivid and entertaining as Froude's.

—The Easy Chair in *Harper's* settles the Carlyle problem by deciding that both sides are right as to facts. Carlyle was unkind to his wife and often made her unhappy, but none the less he had always an ardent love for her. Froude was in grave error in his failure to see that Carlyle's bitter remorse after her death was the measure of his abiding love, not of unkindness and lack of love. Her temper was much the same as his, with the difference of a much narrower outlook, and each of them was doubtless happier with the other than would have been possible with any one else or in single life. In the Editor's Study certain phases of college life are considered, and from a point of view which many would now call antiquated. Put the mind early to the study of Latin and Greek, and thus instil into it the grammatical instinct necessary to the development of good English, while at the same time you develop the imagination by the stories of Homer, Virgil, and Æsop. Prolong the period of absorption and inspiration rather than abbreviate it, and thus deepen the capacity and enlarge the possibilities of the future. In speaking of the "ample time for reading and reflection" of the four-years college course, we fear that the writer assumes a condition practically unknown in most colleges of to-day, and that not so much because of the hurry to get through in less than four years, as of the student tendency to the multiplication of unimportant activities destructive to consecutive reading and reflection. The recent book of F. W. H. Myers draws from Dr. Alexander F. Chamberlain of Clark University a discussion of the "Survival of Human Personality" distinctly favorable to the idea of survival after physical death, though of course dis-

claiming the possibility of its scientific demonstration.

—The editors of the *Atlantic* have tried the experiment of making up the July number almost exclusively from the work of California writers. The leading place is naturally given to a paper on the "Literary Development of the Pacific Coast," by Herbert Bashford. We find in Mr. Bashford's paper rather too much sympathy with the idea that, in order to have a literature of its own, the Coast must "get clean away from ancient restrictions and stereotyped forms," "throw off the musty grip of the past," etc. Ordinarily this does not mean much else than to neglect the fundamental principles of grammar and rhetoric, and substitute chaos for cosmos in the presentation of one's thought. A literature dominated by a conscious and pugnacious determination to be different from the best that has been done in the past, can readily gain that particular end, but its distinction is not apt to be durable or enviable. Not "Be different from the past," but

"Vos exemplaria Graeca
Nocturna versate manu, versate diurna,"

is the motto most likely to produce a literature commensurate with the high level of intelligence and activity which exists beyond the Rockies, assuming that the models of the past be studied not for mere superficial imitation, but to get at their underlying principles and apply these principles intelligently to the subject-matter and conditions of the present. That there is in California some very serious study of the literatures of other times and places is amply demonstrated in Prof. Charles Mills Gayley's answer to the question, "What is 'Comparative Literature'?" The two great universities of the Coast speak through their respective presidents; Dr. Jordan writing of the function of the "Voice of the Scholar" in bringing Democracy back from its constant aberrations to the lines of truth and progress, and Dr. Wheeler pleading for a culture more thoroughly in harmony with the conditions of our national life than those types which have been developed in other lands and under different conditions.

—Aside from fiction the main points of interest in the July *Scribner's* are Gen. John B. Gordon's continuation of his papers on the civil war, and Charles E. Magoon's article on the "Administration of Civil Government by the War Department." Mr. Magoon considers it a piece of good fortune that it has fallen in the way of the military authorities to administer civil government to so great an extent in the islands wrested from Spain, and displays the usual inability of the man of military connections to realize the essential difference between civil government imposed from without, under the sanction of powder and lead, and civil government which is the free choice of the governed. In the smooth sophistry with which he glides over the denial to Cuba of some of the most vital elements of national independence, Mr. Magoon easily wins a brilliant rhetorical triumph over all competitors. It was once supposed that you could not eat your cake and still have it, but, thanks to the political rhetoric of today, you may even be compelled to let some one else eat it and still have it (if only you are willing to let the other party be the judge). General Gordon's reminiscences in this issue are devoted wholly to the battle of Gettysburg. Waiving the question as to what would have been the effect of a Confederate victory in this battle, he argues forcibly that such a victory was possible if only Lee had had the hearty and immediate coöperation of his entire army in carrying out his plans. In the "Flying Colleen Bawn," James B. Connolly contributes one of the best of his effective sea stories.

—This year's Romanes Lecture was given on June 12 in the Sheldonian Theatre at Oxford, by Sir Oliver Lodge, head of the new Birmingham University, on "Modern Views of Matter," a theme, he said, belonging to the more philosophical side of physics, "which has always seemed to me most suitable for study in this university." These words might be viewed as an early and urbane contribution toward the "delimitation of spheres of influence" between Sir Oliver's new university and her ancient compeer in the English Midlands. The body of his discourse contained (1) unspeculative theses briefly stated as agreed upon by physicists, and (2) more speculative opinions plainly denominated hypotheses. As dogmatic theses Sir Oliver stated (*a*) that matter and electricity possess alike the property of inertia or mass popularly associated with matter alone. This attribute, however, in order to become appreciable in an electric charge, requires extreme concentration, and must therefore be associated with "bodies of far less than microscopic size." (*b*) That every atom of matter, when electrified, has as its ionic charge an integral multiple of a certain definite amount of electricity, which may figure as an atom of electricity, and, when dissociated from atoms of the ordinary kind, is called an electron. (*c*) That, through Prof. J. J. Thomson's mathematical data, we can measure the mass of such an electron at one-thousandth of that of a hydrogen atom. The electron, continued the lecturer, is at present supposed to be indivisible, and the electrification of an atom to consist in the attachment to it or the detraction from it of an electron. An atom thus increased is called an ion, and designated as negative; an atom thus diminished is called a positive ion. This not seriously inconvenient inversion in the application of terms was accidental, and dates from Benjamin Franklin. In answer to the question whether the electron has a material nucleus, Sir Oliver conjectured that it had none, but consisted of electricity alone, and, further, that the hydrogen atom might be a grouping of, say, 700 electrons, 350 positive, and 350 negative, interlaced or interlocked in a state of violent motion so as to produce a stable configuration. Indeed, on this view, all the elements would be "different groupings of one fundamental constituent." Unfortunately, the positive electron implied by this theory has never yet, like the negative electron, been "constantly and freely encountered flying about alone." Atoms thus understood could not be permanent, for, in losing energy by radiation—due to electrical charges in rapid orbital motion—they suffer change. The lecturer met this difficulty by scrutinizing investigations "chiefly in France and in Canada, some of the most striking having been made within the present year," which remove "an electric theory of matter" from the "realm of fancy to the region of probability." Professor Rutherford, M. and Mme. Curie have so dealt with the phenomena of radio-activity that "we appear to be face to face with a phenomenon quite new in the history of the world," the transmutation of elements; really possible, though requiring for its achievement millions of millions of centuries. "In fact, the whole of existing matter appears liable to processes of change, and in that sense to be a transient phenomenon." But this change, if ever clearly demonstrated, need not be supposed to involve diminution only; there may be regeneration as well as degradation.

—M. Salomon Reinach has added to his valuable series of "Répertoires" a collection of heads, under the title 'Recueil de Têtes Antiques Idéales ou Idéalisées' (Paris: *Gazette des Beaux-Arts*). The form chosen for this publication is considerably larger than that of his collection of statues, the book itself being an octavo, with one head on each plate; and in a considerable number of cases two different views of the same head are given on successive plates. As the total number of plates is 276, it will be seen that the collection by no means approaches completeness, which the author says he has made no attempt to attain. It is rather a selection of typical specimens of the styles of different periods and schools, including heads of statues as well as busts and fragments. All the plates are "half-tone" reproductions of drawings, the latter carefully executed by Paul Weber from photographs. In his preface M. Reinach explains why he has adopted this method of illustration rather than mechanical reproductions made directly from the photographs themselves; and while we appreciate his reasons, we cannot help wishing that the latter method had been practicable, as the drawings, excellent though they are, necessarily omit many details which would have been of value to the student, and would have insured an accuracy of which one cannot always feel certain in the most painstaking free-hand work or tracing. However, as it stands, the book will be, like all M. Reinach's compilations, an important addition to the library of the student of Greek art, and its value is enhanced by the full notes which accompany the plates.

ROGER BACON'S GREEK GRAMMAR.

The Greek Grammar of Roger Bacon, and a Fragment of his Hebrew Grammar. Edited from the MSS., with Introduction and Notes, by the Rev. Edmond Nolan, B.A., Trinity College, Cambridge, and S. A. Hirsch, Ph.D., Theological Tutor at the Jews' College, London. Cambridge (Eng.): University Press; New York: Macmillan. 1902. Pp. lxxxv., 212.

A Greek Grammar from the thirteenth century is a voice from the past to which all scholars turn with curiosity and respect. Especially we all want to know what Roger Bacon, Doctor Mirabilis, a prodigy of learning in himself, and one of the first to welcome the new light which was dawning in the East, had to tell us of the best way to learn Greek, of which he was one of the very few masters whom England could then boast. Born about 1214, ten years before Thomas Aquinas, he studied at Oxford in his youth; but when he was hardly twenty he went to Paris, then the centre of European learning. He was a student there

during the eventful period when the Church was stirred to its foundations by its delightful controversy about Aristotle, who was first accepted as a fountain of wisdom, then anathematized as a heretic, and finally exalted as a supreme authority in theology. Bacon was more amused than seriously affected by the vacillations of the Church, which he rightly ascribed to their true cause, ignorance of Greek. This experience did much to induce him to write his Greek Grammar. Before the twelfth century, Aristotle was known to western Europe only through Latin translations of a few of his logical works. But a sudden excitement was raised in that century by the appearance in Spain and France of Arabic versions of the Physics, Metaphysics, Ethics, and 'De Anima,' with elaborate commentaries by learned Arab scholars, among whom Averroes was the most famous. These were known in Europe at first chiefly through Hebrew versions from the Arabic, and the Arabic translations had been made from the Syriac by Arabs who knew little or no Greek. The Church at once became eagerly excited by vague accounts of the great religious truths which were said to be found in Aristotle. By command of the Archbishop of Toledo, these new works were translated into Latin, and then were eagerly studied by the clergy. This has been well termed "the rich but dangerous present of the Mussulman to the Christian." Scholars who know the doctrines of Aristotle on the soul as they are given in his 'De Anima' can appreciate the humor of this cordial adoption of the Stagirite by the mediæval Church. A wolf had been let into the sheepfold; but he was at first quite an innocent interloper, well covered by a sheepskin. The Latin versions of Averroes, as G. H. Lewes describes them, were really "Latin translations from a Hebrew version of an Arabic commentary on an Arabic translation of a Syriac version of a Greek text." What Roger Bacon thought of these treasures of learning can be seen in his 'Compendium Studii Philosophiæ' (viii., pp. 468, 469), where he speaks of the "perversity of translation seen in the works of Aristotle, which are the foundations of the whole study of wisdom." "In uno passu unus dicit hoc, et alius contrarium, et tertius contradictorium, et quartus diversum, et alii quotlibet iuxta sensum suum."

"I am sure," he proceeds, "that it would have been better if the wisdom of Aristotle had not been translated. All who know anything neglect the perverse translations. If I had the power, I would have all the books of Aristotle [*i. e.*, the translations] burnt, for it is only a waste of time, a cause of error, a multiplication of ignorance, to study them. Whoever will glory in Aristotle's wisdom must learn it in its own native tongue."

This last sentence is still as true as ever.

While things were in this state, copies of the genuine philosophical works of Aristotle were brought from Constantinople to the West, and there were scholars early in the thirteenth century able to read and expound them. Now, "on a sudden" (as Milman describes it), "there is a cry of horror in the Church." The "rich but dangerous gift of the Mussulman" was beginning to be understood. In 1215 the University of Paris and the Papal Legate solemnly forbade the reading of Aristotle's Metaphysics and Natural Philosophy. But Thomas Aquinas was not yet born. In 1254, after that great scholar had taught the Church how Aristotle might still reign supreme while the Church could define her own dogmas in her own way, the same University of Paris ordained that both the Physics and the Metaphysics of Aristotle should be read publicly at certain appointed times.

A few years later Bacon returned to Oxford, more than ever convinced that theology without Greek, such as he found in England, was a dangerous thing, especially if Aristotle was to be a saint in the Church. His contempt for most of the theologians of England is deep and freely expressed. There are plenty of "Latini" (he says) who can speak Greek, Arabic, and Hebrew; but there are not four of them who understand Greek, Arabic, or Hebrew grammar. The impossibility of exactness in any linguistic scholarship which is not based on a sound grammatical foundation was never more clearly recognized. Even the native Greek teachers, Bacon says, cannot be trusted here. He is greatly shocked by the Bishops' ignorance of Greek. In consecrating a church the bishop was required to write the Greek alphabet in the sand with his staff; but an English bishop generally wrote also three characters (Digamma, Koppa, and Sampi), which are numerals and do not belong to the alphabet. "Sed hoc non fit sine iniuria sacramenti," adds Bacon.

All this determined him to write a Greek grammar "to help the Latins." He awards the highest of his three grades of scholarship in the learned languages only to those who know Greek, Arabic, or Hebrew as they know their mother tongue *(ut nos loquimur Anglicum, Gallicum, et Latinum)*. He absolutely refused this rank to his great friend Robert of Lincoln, whose learning he praises extravagantly in other respects, feeling that there was a want of exactness even in his brilliant scholarship which made him an unsafe guide in difficult questions of interpretation. On the other hand, he thinks that a clever pupil (who is supposed to read and speak Latin like his mother tongue), with a good teacher and a good manual, ought to learn enough Greek in three days (?) to understand whatever relates to theology, philosophy, or the Latin language. This three-day scholarship has never been explained. Bacon surely could not mean that any one could read Aristotle after three days' study. Is it possible that he means only that he could learn enough *grammar* in three days to enable him to go on?

This interesting work is now first published from a manuscript of the fifteenth century in the library of Corpus Christi College, Oxford. The reasons for assigning it to Roger Bacon, as stated in the introduction by Dr. Hirsch, seem perfectly conclusive, although Bacon's name appears only in a late note. What first strikes a modern scholar on looking into the book is the absence of most of the elementary principles of the language which are now an important part of every grammar, and diffuse discussions of what now seem unimportant questions (at least to a beginner) about the alphabet, pronunciation, prosody, etc. We shall give reasons below for thinking that Part II., containing about two-thirds of the whole work, was not originally a part of the Oxford Grammar, which was professedly an elementary treatise. The total absence of Syntax may be due to the imperfect state of the manuscript; but it is very doubtful whether such a work as this would include Syntax. This subject was very briefly dealt with in the elementary grammars used in England and this country even seventy years ago. The famous Port Royal Greek Grammar, a volume of 476 pages, a great authority in our colleges a century ago and later, thus disposes of the whole subject of the moods: "Now though the moods are not to be rejected (?) intirely, yet their signification is sometimes so very arbitrary that they are frequently put for one another through all tenses." Then follow excellent examples of regular Attic usage to illustrate this!

Bacon's Grammar contains 180 pages. It ends with the paradigm of τύπτω, and there must have been at least one of contract verbs in ῶ and one of verbs in μι. There is much careless copying in the manuscript, as *e* for *ae*, *c* for *t* before *i*, etc., which is kept in the printed work. The iota subscript is omitted in most places in the manuscript; but Bacon recognizes it in I. 1, 2 (under diphthongs), and also by the more correct addition of this iota in the line. There are three parts. Part I. has one division (9 pp.) on the Alphabet, in which the letters, diphthongs, accents, and abbreviations are discussed briefly and intelligibly. A second division follows: *De compendiosa instruccione legendi et construendi grecum.* Here we have the Greek letters in various forms, with their names in Greek and Latin letters above them, followed by the names of the accents in both Greek and Latin. Then comes the declension of the article and the relative ὅς, with a transliteration in Latin letters, thus:

ho	*tu*	*to*	*ton*
ὁ	τοῦ	τῷ	τὸν
hos	*hu*	*ho*	*hon*
ὅς	ὅὗ	῾ῷ	ὅν

This is supposed to prepare the pupil to read the Lord's Prayer, the Ave Maria, the Creed, the Magnificat, the Song of Simeon, and the Song of Zachariah, which are all given at length in three parallel lines, the Greek at the bottom, with each word spelled in Latin letters above it, and above this a Latin translation of each word, with the cases often wonderfully perverted to correspond to the case of the Greek below where the Latin would use another case, some Latin words being omitted which would not correspond to anything in the Greek. Of course the pronunciation of Greek is always the native Greek, no other being then in use. We give a few specimens of these remarkable documents:

Pater	nostrum		in		celis
Patɐr	imon	o	en	tis	uranis
πατηρ	ἡμῶν	ὁ	ἐν	τοῖς	οὐρανοῖς

et non (*vel* ne) inducas nos in temptacionem
ke mi isenegkis imas is pirasmon
καὶ μὴ εἰσενεγκῃς ἡμᾶς εἰς πειρασμόν

It is worth noticing that our Franciscan friar gives the orthodox Greek form of the famous passage of the Creed, making the Holy Ghost proceed from the Father alone:

ex		patris		procedentem
to	ek	tu	patros	ekporeuomenon
τὸ	ἐκ	τοῦ	πατρος	εκπορευόμενον

(Here *ex patris* copies the Greek construction, avoiding the Latin ablative.)

Then follows a table of numerals α, β, γ, etc., with their Greek names *ena*, *dio*, *tria*, *tessera*, etc., written below them in Latin letters.

Next we have Part II. of 118 pages, containing long and abstruse discussions of the same subjects (orthography, etc.) which were explained in the first division of Part I. This seems entirely out of place in an elementary book, and one who studied this would not need the briefer statement in Part I. The first sentence in the first chapter explains the difficulty: "Terminata parte illa in qua proposui ea que pertinent ad lenem et introductoriam instruccionem legendi grecum et scribendi et construendi, nunc tempus est ut *maiora copiosius indicantur*." This whole discussion, then, belongs to the larger treatise of which he often speaks as a part of his plan, and is no part of the elementary grammar in which it is found. If we leave this out of the account, we have the simple introduction of twenty-three pages, already described, followed by Part III. on Inflection. This contains thirty-eight pages, in our edition; but much has been lost at the beginning, and the inflection of the verb is incomplete at the end. We have had nothing on inflection before this, except the declension of the article and ὅς in Part I. Part III. begins in the manuscript with Division III. Ch. 5, where we find the declension of nouns in ξ and ψ, followed by a chapter on contract nouns and nouns in εως of our second declension. Then comes a short chapter, *De figura ac specie;* next the inflection of pronouns, and finally the conjugation of the verb. Here we find the Byzantine paradigm of τύπτω. which held its place in our grammars until near the middle of the last century. Those of us who were driven to learn all the traditional forms of this verb, with every tense of every mood formed by inexorable rules, often producing words which no classic Greek could have understood and which often violated the very rules they were invented to illustrate, were astounded and secretly delighted to learn at last that τύπτω is really a very defective and rather irregular verb, and that of the twenty-five tenses (with about 100 modal forms) given in the Byzantine paradigm, only two occur in Attic Greek and only six at all, while all the second futures active and middle were never formed and never could be formed from verbs like τύπτω.

It has been thought that the use of τύπτω to illustrate all possible forms of the so-called barytone verb shows that Bacon followed the first grammarian, Dionysius Thrax, who wrote about 100 B. C. But though Dionysius refers to τύπτω, he refers also to κόπτω; and the full paradigm of τύπτω was certainly added to his text many centuries after his time. We may safely accept Bacon's own statement of the authors on whom he depended, feeling sure that he would have included the first of Greek grammarians if he could have done so. This list is: Bede, Priscian, Donatus, Servius, Lucan, Juvenal, Statius, Horace, Persius, Juvencus, Arator, Prudens, Paulinus, Prosper, Sedulius, Isidorus, Pliny (p. 37).

RELIGIOUS LIFE IN AMERICA.

Religious Life in America. A Record of Personal Observation. By Ernest Hamlin Abbott. New York: The Outlook Company. 1902.

La Religion dans la Société aux États-Unis. Par Henry Bargy. Paris: Armand Colin.

We have here two books which criticise and complement each other in an interesting manner. With a subject in which inhered the possibility of the dullest of dull books, Mr. Abbott has written one of such attractiveness that its fine externals do not belie its spiritual contents. His method is not statistical, but personal and impressionist. He has great skill in seizing on the vital elements of a scene, a situation, or a character, and he translates his observations into an expression that is extremely vivid, striking, picturesque. Had he called his book, 'Religion of America,' the title would have been a misnomer, his examples are so isolated and sporadic and are drawn from such a limited area. There is nothing here about New England except in the way of casual reference and a brief *amende* in the concluding chapter, which is given up to generalization with much loss of interest. There is nothing here about the great States of New York, Pennsylvania (Bethlehem excepted), and Ohio, where certainly the religious phenomenon is not less important than in the States farther south or west. There is nothing here of the Pacific slope. Mr. Abbott's observations have been made, with the exception of Maryland, exclusively in the Southern and Middle Western States; and while within these by no means contracted limits the immediate examples fill the eye and constitute the principal attraction, a few inferences are drawn with so much care that they deserve a proportionate consideration.

Mr. Abbott began his round in Baltimore, and his two chapters on that city are devoted to the relations of the workingman and particularly of organized labor with the churches. His conversations with both clergymen and workingmen are rendered in a convincing manner. He did not find the workingman's indifference to the churches significant of an equal indifference to religion. But, while the well-to-do dislike "live issues" in the pulpit, the workingman cares for no others. He would have the preachers come to the union meetings, and "preach about anything—only not about heaven." Some of the preachers were as stern as the workingman in their construction of the average clerical character. One of them declared that the social environment had so deadened the spirit of self-sacrifice among ministers that they hardly knew what it meant. But the church suffers as much from the prominence of well-fed, self-satisfied laymen as do the unions from their noisier and more irresponsible agitators.

The encouragement of Mr. Abbott's book is in its discovery of such individuals as his Virginia country rector. Though he seems to have a touchstone for selecting them, we are obliged to think that where he finds so many there must be many more. Certainly the portrait of the Virginian is a most engaging one. He is a Jack-at-all trades and poor at none, be it that of preacher or man midwife. A chapter on the religious tendencies of the negro is peculiarly interesting at the present time. Giving a lively picture of the emotional negro preacher, Mr. Abbott concludes that he is going to the wall. One preacher regrets that the distrust of emotionalism, responding to white criticism, was reducing the emotional tide so low that the ecclesiastical machinery could not be kept running. Next we have "New Tendencies in the Old South." The general religious life is immensely traditional and conventional, with here and there a sign of better things. A sexton of fifty years' service and a bell-ringer boasting sixty-one were samples of the average immobility. A "cake of custom" formed so hard will not be broken without some violent, though perhaps superficial, irruption of hot infidelity.

Nowhere was Mr. Abbott more disabused of the impressions that he took along than in New Orleans. The Creole domination was by no means what he expected. Coming to "The Edge of the Southwest," we travel with a lot of drummers, one of them, who passes round the whiskey as he recommends his Bible-chart, a man "to shake the midriff of despair with laughter." At one point Mr. Abbott's known connection with the *Outlook*, for which he was preparing these chapters, chilled the reception accorded him in the office of a Baptist weekly paper. Finally there was frank confession: "We used to read the *Outlook* with great pleasure, when it was liberal; but now it has flopped on public questions." Even in Arkansas there were at least individual signs of growth in the direction of a more human presentation of religion, the goal towards which Mr. Abbott's longing tends throughout his book. Kansas, the eastern West, Iowa, and Colorado have each an interesting chapter, that on Iowa the least clear in finding there conventionalism in unexampled force, while still there is so much that comes under a different kind. In "The Leaven and the Lump" we have a good account of the interactions of the Western country and its immigrant population in "New Sects and Old," some varieties of religious experience which escaped Professor James's scrutiny; Dowie's Christian Catholic Church in Zion and Chicago overtopping every other in its unblushing impudence and unspeakable vulgarity. In the same chapter we have the Pennsylvania Moravians depicted with such exquisite sympathy that we think we will go to Bethlehem and find rest for our souls.

The method of M. Bargy's book is entirely different from that of Mr. Abbott's. He is idealistic, optimistic, abounding in confident generalizations, basing these entirely upon written matter. What is nothing in Mr. Abbott's presentation is almost everything here—the New England liberalism of Channing and Emerson. At the same time the agreement is considerable between our two writers in the general conclusions at which they arrive. Mr. Abbott's is that "religion in America is characterized not so much by devoutness as by righteousness, less by the look-upward than by the look-outward." M. Bargy's is much the same: that our religion is social, positive, more attentive to the human than to the supernatural, to society than to the individual. These traits are found inhering in the Puritan theocracy to a degree that will astonish many readers who imagine the dogmatic preoccupation of the Puritan to have been immense. But M. Bargy is speaking relatively, and it may be that his disengagement from the phenomena which he describes enables him to judge of them

more justly than if he were traditionally entangled in them. Another interesting aspect of his book is its idea that all the churches of the United States, Protestant and Catholic, are more neighborly and friendly among themselves than they are with their mother churches in Europe, and more neighborly and friendly than the European churches are among themselves. The severest strain upon this idea is afforded by the chapters on Catholicism, which, we are assured, is more American and Anglo-Saxon than it is Roman, and more positive and social than formalistic and dogmatic. Here and elsewhere some individual like Father Hecker is made to carry more than he can bear. There is similar exaggeration when we come to Channing and Emerson and Dr. Adler and the ethical societies. Similarly, "le christianisme des Juifs" is overdone, and "la tolérance dans l'interprétation biblique."

Following an introduction that describes Christian positivism—a term which in its turn is supposed to describe American religion fairly well—we have a series of seven books. The first of these deals with the social instinct in colonial Christianity; the second with the positive instinct under the same conditions; the third with the positive spirit in the philosophy of New England Christianity. "American religion, for a long time unconscious of itself, came to consciousness in the nineteenth century; it inspired a philosophy and a great body of literature; Channing and Emerson made it known to strangers; after having been only an element of local history, it entered into the current of universal ideas; the social instinct became the social spirit; the positive instinct became the positive spirit." The first chapter in the fourth book, "L'Esprit Social dans les Philosophies Chrétiennes," is devoted to the individualistic socialism of Channing. Here and there a fact or inference suffers that sea change which is so commonly effected by the Atlantic's width between subject and object, but in general the simplicity of Channing's life and thought stands M. Bargy in good stead. It was, however, certainly not from 1820 to 1830, but from 1830 to 1840, that Channing put forth preëminently his social strength, seeking to become, as he said, "less ministerial and more manly." An equally good chapter deals with the Transcendentalists, Brook Farm, and related matters. The two following books treat of the positive and social spirit in contemporary American religion, and a last one of religious peace through Christian positivism. These chapters breathe an amiable spirit, liberal and humane, but they would, perhaps, have been less up in the air if M. Bargy before writing his book had met Mr. Abbott's, and read it carefully.

The Aaron Burr Conspiracy: A History Largely from Original and Hitherto Unused Sources. By Walter Flavius McCaleb. Dodd, Mead & Co. 1903. Pp. xviii., 377.

Many students, some very capable ones among them, have occupied themselves with the Aaron Burr conspiracy. Though the subject is full of difficulties, the verdict commonly reached is that the schemes of Burr were both treasonable and filibustering. The best statement of this view—the one which has come to be regarded almost in the light of a classic—is unquestionably that of Henry Adams. Mr. McCaleb has gone over the whole field once more, with a carefulness unsurpassed, and with an attention to sources unequalled, by any of his predecessors, and the conclusion which he reaches is quite different from that of Mr. Adams. Briefly stated, Mr. McCaleb's finding is that the schemes of Burr were filibustering only—that they in no sense involved the separation of the Southwest from the Union.

This conclusion is based partly on the examination of hitherto unused sources. Unfortunately, we think, Mr. McCaleb has not prepared a formal bibliography, but in the preface the main sources have been indicated. The archives of Texas, the archives of Mexico, the newspapers of the Southwest, the Andrew Jackson MSS., the Clay MSS., and the Jefferson MSS. have been examined. More particularly, the author has used to advantage a volume of MSS. in the Department of State at Washington, entitled 'Letters in Relation to Burr's Conspiracy.' Finally, three maps, prepared by Burr, now possessed by Mrs. T. C. Wordin, have been examined. Together they represent the lower Mississippi, the Gulf Coast, and the section of Mexico between Vera Cruz and the City of Mexico. While the author asserts the great importance of these maps, he does not in reality make much use of them, or show very clearly how they invalidate the theory that the conspiracy involved treasonable purposes. On the whole, it appears that the new material examined has been of service to the author, not so much in clearing Burr of treason as in throwing considerable light on the shady and tortuous path followed by James Wilkinson.

Light upon Wilkinson may very well be light upon Burr; but the central position of Mr. McCaleb—that Burr's schemes were not treasonable—rests for support principally upon new interpretation of old material. Of fundamental importance is his treatment of Burr's intrigues with Merry and Yrujo, the English and Spanish Ministers. That Burr made treasonable proposals to these two men is unquestioned. It has hitherto been considered that these proposals reveal Burr's real purpose with reference to the Southwest. Mr. McCaleb maintains, however, that they were made merely as a blind, in order to secure money from the English and Spanish Governments for the purpose of executing his real design, the expedition against Mexico. Mr. McCaleb's position centres in this interpretation of the Merry and Yrujo intrigue, and the careful narration is made to enforce three classes of facts which tend to support this interpretation. First, the conduct of Burr, both in speech and in action, aside from his dealing with Merry and Yrujo, reveals no treasonable purpose, while his "revelations to Blennerhassett left no doubt as to the object in view" (p. 49). Second, that no sane man who understood the situation of affairs would make such proposals as Burr made to Merry and Yrujo, since there was nowhere in the Southwest, even in New Orleans itself, any sentiment in favor of revolution, or any action taken in the interest of revolution. Third, the stories of treason which filled the newspapers and created such excitement in the Southwest, and the connection of these stories with Burr and his expedition, were largely the work of James Wilkinson.

The first point is one which involves an explanation of Burr's conversation at Cannonsburg, the "Querist" articles in the *Ohio Gazette*, and the revelations to William Eaton. The author's explanation of these matters, though not wholly convincing, may pass. It is nevertheless obvious that, assuming Burr to have had treasonable designs, the English and Spanish Ministers were almost the only persons to whom it was safe for him to reveal such designs frankly. If there were others, certainly Wilkinson was not one. The author, indeed, makes much of the fact that the famous letter of Burr to Wilkinson, of July 29, contains no hint of treasonable designs, and charges his predecessors with having grossly misinterpreted it (p. 75). The point of Henry Adams, however, is precisely that this letter was a tissue of falsehoods. Finally, this argument of the author is weakened by the fact that it is wholly due to the official position of Merry and Yrujo that we know more of Burr's intrigues with them than we do of his intrigues with others. To base a positive assertion on mere lack of evidence is always dangerous, and in the present case the danger has not been altogether avoided.

The second point in a sense constitutes the strength of the book. While it is of course poor logic to say (putting it baldly) that Burr could not have seriously meditated certain wild, treasonable schemes because they were too wild and impracticable for Burr seriously to meditate, it is yet difficult to exaggerate the strength of the impression one gets from a careful reading of the book, that Burr's conduct as a whole is scarcely intelligible if one assumes that his designs were treasonable, while it is easily intelligible if one assumes that his designs were filibustering only. Mr. McCaleb has, in fact, achieved a remarkable, almost an artistic, unity in subordinating his material throughout to the production of this effect.

In dealing with Wilkinson, to take up the third point, Mr. McCaleb has made good use of the "Letters in Relation" and the Mexican Archives. His thesis is that Wilkinson worked in harmony with Burr so long as war with Spain seemed a possibility. The occupation of territory east of the Sabine by Herrera seemed to make war inevitable; his sudden and unexpected withdrawal made it impossible. From this moment, not from the receipt of Burr's letter of July 29, Wilkinson resolved to desert Burr, spread the false report of treason, and himself pose as the savior of his country. His subsequent conduct in New Orleans, his intrigues with the Spanish authorities, his correspondence with Jefferson, are carefully analyzed, and the conclusion is all but irresistible that Wilkinson was making an elaborate show of heroically resisting dangers that never really existed.

On the whole, while we do not believe it is possible to *prove* that Burr did not have treasonable designs, Mr. McCaleb's substantial service has been in making it clear that such designs, by whomsoever entertained, were, under the circumstances, wholly impracticable: that Burr must have very early given over the serious consideration of such designs if he ever enter-

tained them; and that the interested action of James Wilkinson is responsible for the importance with which the treasonable side of Burr's schemes has been invested.

John Lackland. By Kate Norgate. The Macmillan Co. 1902.

In prosecuting their study of the Middle Ages, the French produce a kind of monograph for which, unfortunately, there is no exact equivalent in the historical literature of England. We refer to the learned and exhaustive survey of a given reign. Not only are the great sovereigns of the twelfth and thirteenth centuries thus dealt with in detail, but the early Capetians and even their Carolingian predecessors receive the honor of a most careful biographical notice. Any one who has received a catalogue of theses from Picard or Welter will know what is meant, and works of a similar order appear in the 'Bibliothèque des Hautes-Études.' As particular examples may be named M. Pfister's 'Robert le Pieux,' M. Funck-Brentano's 'Philippe le Bel,' and M. Lauer's 'Louis d'Outremer,' but these are only a few striking examples which may be selected from the large number of such biographies. In English, though lives of the kings abound, they do not often conform to this type. They are less minute, and as a rule less erudite. They may have their individual merits, but they are of another spirit. We make the foregoing distinction neither to praise nor to condemn. We would simply say that, since rules have their exceptions, Miss Norgate's 'John Lackland' is comparable with such studies as those of Pfister, Funck-Brentano and Lauer.

Miss Norgate's knowledge of the Angevin period is already well recognized, and anything that she may commit to print regarding Henry II. or his sons is sure to be received with attention. Were we tracing her antecedents as an historical writer, we should associate her with Freeman, whose reputation she defended with spirit against Mr. Round, and with Green, whose claim upon her allegiance is also strong. It may be said that the present volume is in some respects an expansion of Green's judgment against John. Miss Norgate's learning, of course, is all her own, but her text is the passage from Green that stands as a motto in front of her first chapter: "The closer study of John's history clears away the charges of sloth and incapacity with which men tried to explain the greatness of his fall. The awful lesson of his life rests on the fact that the king who lost Normandy, became the vassal of the Pope, and perished in a struggle of despair against English freedom, was no weak and indolent voluptuary, but the ablest and most ruthless of the Angevins."

The constitutional bearing of John's misdeeds and punishment is bound to be the chief topic in any account of his reign. While this is true, it should be stated that Miss Norgate does not depart so far from the canons of good narrative as to sacrifice everything else on the altar of Magna Charta. She takes John from the moment of his birth at Oxford to the hour when his soul departed amid the raging hurricane at Newark. Step by step she traces the development of his character and the course of his inhuman policy, until she has explained beyond a chance of reasonable doubt why the realm stood arrayed against him in the year of his death. If policy and politics bulk larger than personality in the pages of this sketch, we may justify Miss Norgate on the ground that she has emphasized the subject which is least unpleasant and most important. When John commits Maud de Braose and her son to the dungeon of Windsor, and there starves them to death, it is well that his barbarity should be described in the text; but it is also well that the domestic infelicities of Eustace de Vesci and Robert Fitzwalter should be consigned to the appendix.

Of Miss Norgate's seven chapters, two are occupied with an account of John's youth, and the other five describe the period of his reign. Following another analysis there are, besides the tale of the King's own delinquencies, three main subjects—the loss of Normandy, the struggle against Innocent III., and the strife with the barons. Limiting our notice to one of these, we shall select the last and consider how Miss Norgate depicts the antecedents of Runnymead.

Any one who has paid the least attention to the reigns of Henry II. and Richard knows that even then there was strife enough between king and barons regarding military service on the island and abroad, the frequency and amount of scutage, and the right of the crown to exercise control over the castles. But it was not merely the friction arising from inveterate clash of interests which led to the Great Charter, nor was the uprising of the barons chiefly due to discontent at the loss of Normandy. "The bitterness of such dispute," says Miss Norgate, "was intensified by John's personal dealings with his barons, his subtle contrivances for stealing from them their rights over their own tenants and their own land, his interference with their domestic life by his continual demands for hostages, and, above all, in many cases by a desecration of their homes which blood alone could expiate."

In this era of misrule one of the King's most hateful and iniquitous devices was his compact with the sheriffs to increase the ferm of the shire, on an understanding that the profits should be shared by sovereign and agent. As the sheriffs had always been distinguished by the grasping spirit of the publican, it was the duty of the Government to stand between them and the people, as Henry II. and Richard had done from time to time. John, with his positive genius for injustice, made the sheriff his minion in a new and oppressive sense. Among the engines of this new tyranny, perhaps the most glaring was the revival of ordeal, although Henry II. had limited this barbarous and obsolete mode of trial to cases in which the charge was made on the presentment of a sworn jury. At the same time the administration of justice was so corrupt that no lover of peace and order could hope to obtain redress from the courts.

The barons had public wrongs in abundance besides their grounds of private resentment, but they needed a leader of greater astuteness, mental breadth, and moral fervor than could be found among their own ranks. Here Miss Norgate joins with her chief predecessors in glorifying the name and deeds of Stephen Langton. She goes so far as to accept, in substance, the story which Wendover introduces with an *on dit* ("ut fama refert"), to the effect that the Archbishop discovered the Charter of Liberties, brought it to a meeting of mutinous barons, and made it the basis of constitutional demand. "This story is given by Roger of Wendover only as a rumor; but, whether the rumor were literally true or not, it was at any rate founded upon a fact—the fact that the movement which was to result in the Great Charter owed its true impulse to the statesmanship, not of any of the barons, but of Stephen Langton." Anselm and Becket had proved that the Archbishop of Canterbury was more than the first subject of the realm when an issue relating to religion arose. Langton went a long step further, and won a more unusual victory for his see, when he converted the rage of injured barons into a demand for political justice.

This book must be held to rank among the best studies of English mediæval history which we possess.

A History of Ottoman Poetry. By the late E. J. W. Gibb. Volume II. Edited by Edward G. Browne, Professor of Arabic in the University of Cambridge. London: Luzac & Co. Pp. xl., 406.

The publication of the present volume of this great work is marked with a sad interest. In our review of the first, Mr. Gibb's unique position as a Turkish scholar, easily alone in England and without a superior in Europe, was pointed out. Some account was given also of his previous work and publications. Now that record must be drawn to a hasty close. In December, 1901, Mr. Gibb died at the early age of forty-four, and the world was robbed of a great scholar, and an almost unique interpreter of the East to the West. For in him we have lost not simply a man of books and their learning. He was one of those strange appearances which from time to time confound our particularity and show that the whole race of mankind is truly of one blood. Born under the gray skies of Scotland and in the smoke of Glasgow, his mind and sympathies were of the South and East; when he turned once for a brief space from Constantinople and Asia it was to mediæval France and the sun-lit forest and shore of 'Aucassin et Nicolette.' And so, being himself truly of such climes, he understood them and their peoples and could render and explain their emotions and conceptions—that whole seemingly inexplicable content of alien minds—to us whose lives and thoughts are cast so far away. His, then, was that rare gift of sympathy and interpretation—so much rarer than any scholarship, however refined; and his life has gone out precisely when the East is opening again to the West and the need is greatest for such mutual understanding. At such times these few men of universal race avail more than diplomats, schools or missionaries.

But this book of his, at least, is not to become, like Lane's unfortunate lexicon, one of the too many torsos of Oriental learning. The MS. of it lies nearly perfect, and, by the care of his parents and widow, is to be completed and published. This task has been assumed by Prof. E. G. Browne, an intimate friend of Mr. Gibb, himself a Turkish scholar, though doing all his work in the field of Persian. Of his entire capacity to bear the responsibil-

ity of editing so monumental a work there can be no doubt. The only possible difficulty will be in an essential difference of temperament between himself and Mr. Gibb. In Mr. Gibb there was a singular personal repression; assertion of himself it will be vain to seek on his own pages. His editor's personality is exuberant; most entertaining and often instructive, it is true, but liable to come between the reader and the subject. Thus, in his preface there is almost as much about himself as about Mr. Gibb. The same difference of temperament has led him to add a number of notes, only a few of which, it is safe to say, were really necessary. But apart from this difference in personal equation, for which allowance can easily be made, there can be no question that he will carry out his long task ably and loyally.

The present volume stretches from 1450 to 1520. It enters and forms the first part of the Classical Period of Ottoman Poetry, the real beginning of that poetry. For it the times were ripe. Constantinople fell in 1453, and the Ottoman Empire was consolidated and ready for its long career of conquest. The Ottoman Turks were no longer one dominant tribe among many; all Turks now passed over among them and wrote from this time on in the Ottoman dialect of Turkish. East and West, too, were separating. The Renaissance in Europe led our civilization away on a new path in which the East did not follow. So, while the civilization of the mediæval world from central Asia to the Atlantic was fairly one in its ideas and aspirations, the rent now entered which only in our days is being slowly bridged. There came also a new literary influence from the remoter East. The classical period of Persian literature culminated at the court of Sultan Husayn Bayqara at Herat. There Jami, the last great Persian, and Newa'i, the first great Turkish poet, wrote. That the latter wrote in Eastern (Jaghatay) Turkish mattered little. He gave the suggestion and impulse to Ahmed Pasha, the founder of the Ottoman school, and in his path the Ottoman Turkish poets went until Baqi, who died in 1600. The tone and meaning of this departure and the spirit of the poetry which came from it were well put by Mr. Gibb as follows:

"But it is not only in matters political and dialectic that there has been a change; a seeming transformation has occurred in the realms of poetry. When we reach the Second Period we enter into an ideal world. The voices of theologian and schoolman are silent, and in their stead we hear the lover's sigh and the nightingale's lament. The poets seem to move in an enchanted land full of blooming roses and singing birds and beauties fair beyond all telling. And we, too, when we enter this fairyland, seem to pass beneath the influence of some magic spell. We wander on as in a dream, knowing not whether the lovely forms that arise on every hand are realities or shadows. A radiant iridescent haze envelops all things, rendering them vague and uncertain, while it transfigures them. For we are in the realm between heaven and earth, where the Mystic Love has met the Human and joined hands, and the two have become one. And so it were vain to ask whether what we see is the sweet face of some mortal fair one or a flash from the Eternal Beauty, a glimpse of God's own Self."

To this, little need be added. A list of the names dealt with here would mean nothing. Three points alone are worth making. First, a well-taken protest by Mr. Gibb against calling Turkish poetry an "imitation" of Persian, and therefore to be disparaged. Rather, both are expressions of one civilization and one literature, written partly in Persian and partly in Turkish. The situation is very closely analogous to the relation of French and English literature in the time of Chaucer. Was Chaucer an imitator in any sense open to disparagement? The literature in either language was one; the parting of the ways had not yet appeared, and Gower wrote both in French and in English, as some Turks did in Persian and in Turkish. Second, Mr. Gibb's translations, fantastic, strained, and "precious" as they often seem, represent exactly their originals. "Had all our poets from the days of Spenser persisted in writing in the artificial idiom of the 'Faerie Queen,'" we should have had an exact parallel to the language of Turkish poetry. This holds generally, but not always, it must lastly be added. For even in this first part of the classical period we have such a poet as Mesihi, who throws aside his Persian books, and, without metaphysics or allegory, writes with objective humor of the things he himself has seen. So, too, the human breadth of Chaucer broke through his French training.

One single slip may be noticed, and it is not in Turkish literature. The book by al-Ghazzali mentioned on p. 102 is not an abridgment of his 'Ihya,' but an independent work.

The Making of Citizens: A Study in Comparative Education. By R. E. Hughes. London: The Walter Scott Publishing Co.; New York: Charles Scribner's Sons. Pp. 405.

The Educational Systems of Great Britain and Ireland. By Graham Balfour, M.A. Second Edition. Oxford: Clarendon Press; New York: H. Frowde. 1903. Pp. 307.

A mass of valuable information resides in Mr. Hughes's book. Detailed but concise descriptions of the primary and secondary school systems of England, France, Germany, and America, statistics in regard to number of schools, teachers, salaries, attendance, occupations of children, etc., the essential features of the different kinds of schools and the different plans of organization and administration, are all included, and an attempt is made at a comparative evaluation of the merits of the different systems. Nowhere else in a single volume can any such compilation of facts in regard to present school organization be found. Nor is the mere presentation of facts all. The purpose of the author, as indicated in the preface, "has been rather to utilize statistics as a means to an end—and that end is the presentation of a reasonably clear and well-defined set of pictures illustrating the systems of education at work in these countries. Statistics are used as guides, not gauges." It is refreshing to find an author who sees the wider social aspects of the school, and of educational movements, as a few pregnant passages will illustrate. Systems of education naturally group themselves into two classes, individualist and socialist. France and Germany form striking examples of the latter, England and America of the former. Those of France and Germany are strongly bureaucratic. They are State, not local, institutions. The American system is controlled by the people, and there is a large measure of local autonomy. The English system is "a compromise between the bureaucracy of Europe and the licensed liberty of America." As regards the teachers, who, in the last resort, always determine the character of the school, the English primary teacher usually has some professional training, and is efficient. The French teacher has professional training; promotion is entirely by merit, and he possesses "absolute security of tenure"; he ranks high socially, has no compulsory extraneous duties, and is supposed by the State to be a scholastic priest "and to keep aloof from worldly matters." The German primary teacher also has professional training and secure tenure of office, takes up the task as a life work, and looks forward to a pension upon retirement. Of the great army of American primary teachers, 400,000 strong, "it is impossible to make any general statement except that in variety it is unexcelled." Professional training is required of the secondary teacher also in France and Germany, especially in the latter country; but "there are practically no professionally trained teachers in the English secondary school," and in America training is by no means indispensable. Again the wider social function of the teacher is not overlooked. Not only in France, but "it is said that the primary teacher in all lands is preëminently *the* political agitator. One might imagine that the school was the storm centre and the teacher the petrel of politics. . . . The teacher leads the vanguard of civilization."

The conclusions of the whole investigation, though briefly stated, are important. First of all the author finds that his study emphasizes a very important old truth:

"Each system of education can only be understood when seen in its own setting. Each is an expression of its nation's genius; it is characteristic of its people. In so far as it is thriving it is truly popular, and only so far as it is popular and peculiar is it national. The habitat of each system is fixed, it is an indigenous product; consequently, it is not only unscientific, but it is impossible, to measure comprehensively any system of national education in terms of another. These systems cannot be arranged in order of merit. The finer elements, the more ethical and spiritual factors in national culture, defy the balance of the analyst and the scalpel of the anatomist; they are susceptible to no quantitative tests. Thus the whole drift of our investigations points to this one main conclusion: every country has, in the main, that system of training best adapted to its present needs, and most capable of developing in such a way as to meet future national needs."

Each system reveals certain general tendencies showing the growth of world citizenship. Similar movements are agitating the mass, whether in Europe or America. Certain aspects of national education are becoming more prominent; and the most striking movement is that towards true social equality, especially in recognition of the equality of the sexes, or the growth of the democratic ideal. The lengthening of the school life is an international movement. The work of education in the more democratic states is being given over to women—in the author's opinion a dangerous experiment. While some of the most essential attributes of the teacher are characteristic of women, nevertheless the de-

velopment of "adaptability at the expense of reverence is the price exacted of a people placing training entirely in the hands of women."

It is hardly to cast blame upon the author to say that the sociological study suggested by the title is inadequately done. To make any such investigation and to determine the influence of the school as a factor in the making of citizens is by no means an easy task; but one detects something of the schoolmaster's fallacy that the school is the chief or the only institution engaged in the making of citizens. One need not stray far, however, from the statistics presented by Mr. Hughes himself to see how erroneous any such view is. As workingmen go, the English artisan and laborer stand high for intelligence and efficiency; and yet until recently, as shown by the official blue books of the British Government, the schools from which these artisans have come have been inadequate and inefficient and the teachers incompetent. This was notoriously true until the formation of the board schools in 1870, and reports within the last ten or fifteen years showed that much of this inefficiency still remained. We have, then, this remarkable paradox: on the one hand, schools inadequate and inefficient; on the other, workingmen, the product of these schools, intelligent and progressive. The explanation is not difficult. The schools were not the only factors in producing the English citizen. He was produced by the English home, the workshop, the playground, and other educational factors, rather than by the school. It is not as easy, perhaps, in other countries that have had better schools to show the influence of extra-scholastic education; but the work of the school can be rightly estimated only by studying it in connection with these other factors which coöperate in the making of the citizen.

Mr. Hughes might wisely have postponed the publication of his book for six months. A revised edition is demanded to give an account of the new programme for the German secondary schools provided by the law of 1902, of the great reform of the same year in secondary education in France, and of the reorganized English system of schools under the Education Act passed last winter by Parliament. The two former are merely referred to in footnotes; and the English law not then passed is merely anticipated in a brief appendix. Hence, readers must remember that this, like nearly all of the current books on school organization in Europe, is largely ancient history.

The second edition of Mr. Graham Balfour's compendious account of the educational systems of Great Britain and Ireland supplements the treatise by Mr. Hughes so far as English education is concerned, and presents with other new material the main provisions of the now famous Education Act of 1902, an act passed, as Mr. Balfour believes, "in response rather to ecclesiastical pressure than to the united enthusiasm of the Cabinet for education." The general character of recent progress is suggested by the author's experience. "It has proved," writes Mr. Balfour, in his preface, "far more difficult than before to treat the subject in three water-tight compartments as elementary, secondary, and higher; the three grades are in fact becoming parts of that organic whole which it is essential for us to form." While an excellent outline is given of the complex educational system of England, in presenting this vast array of facts the author has little time to note the wider relations everywhere suggested. Why should a book, because it is called educational, confine itself to mere statement of dry facts? From the barren account of the Education Act one would hardly suspect the great social, ecclesiastical, and political movements that led up to the new law, and made it so important that it was forced through the House of Commons under the personal management of the Prime Minister, being finally enacted only "after the guillotine application of the closure"; nor that the passage of the law has moved half of England profoundly, and stirred the old spirit of "passive resistance" so that certain nonconformists are letting the sheriff sell their household goods or hale their bodies to prison rather than pay what they deem an unjust tax for the support of denominational schools. We are grateful for concrete facts; but the wider relations are the significant things, and to miss these is to miss everything of vital human interest.

The Woman Who Toils: Being the Experiences of Two Ladies as Factory Girls. By Mrs. John Van Vorst and Marie Van Vorst. Doubleday, Page & Co.

An interleaved note says that since this book was written, the South Carolina Legislature has passed a bill prohibiting the employment of children under ten years of age. If there is a connection between the book and the law, the former could have no more worthy comment. After reading the closing chapter on child labor in the Southern cotton mills, the readers returns to this note as to a crumb of comfort, inadequate though its provisions of relief read. It was a bold and brave experiment that the writers made when they put on factory girls' attire, worked beside them in mills, and, what must have been harder, lodged and ate with them. The experiences set down are those met in a Pittsburg pickle factory, in a Chicago clothes' factory, in a New York knitting mill, in a Lynn shoe factory, in South Carolina cotton mills. The authors write in the main judicially; if some purple patches appear in the second half of the volume, they do not, because they cannot, avert sympathy from the whole grievous matter. In some ways the conditions were surprisingly endurable. Very little of Faginism appears. The employers and foremen, with notable exceptions in the Southern mills, were fair. The hands were invariably so. The lodging and boarding house keepers were not of the ilk of Good Mrs. Brown. Persecution of a personal sort rarely appears in these pages. The whole horrid system of hours, the unenlightened modes of living, in many cases the unenlightened motives for working, the drop of the wage level through the lack of differentiation of wage earners from semi-wage earners—all these things make the sadness of the tale, and all these stand forth in a glare the more revealing in that it is the glare of day and not of pyrotechnics.

Mrs. Van Vorst puts her facts so simply that no reader is compelled to agreement against his will. On the contrary, he feels at perfect liberty to differ from her inferences on her own showing. When the tired eyes of a veteran worker seem to say to the novice: "Your youth and vigor are at full tide, but drop by drop they will be sapped from you, to swell the great flood of human effort that supplies the world's material needs"—there rises to the lips the answer, What is all life but the expenditure of youth and vigor? If human needs are insistent, so much the better for the workers. Shall eaters of pickles and wearers of shirts be condemned by philanthropists because the working classes are overworked in the producing? Like other writers these two ladies here and there confound working with overworking. The mill's "jaws" are not necessarily "merciless." They are the gateway to food and raiment. It is the outrageous abuse of human capacity for endurance that makes monsters of the mills. It is not the curtailing of human needs that is wanted. It is a radical readjustment of the conditions of labor that is cried for, and that a book like this must do a tangible something to effect, however it here and there steps off into phrases.

Relief for overtoiling millions of women is, in Mrs. Van Vorst's judgment, to be achieved first of all by separating the breadwinner from the girl who works for luxuries, by attracting the latter into a "field of work which requires instruction and an especial training"—in other words, industrial arts, lace-making, hand-weaving, and the like. To draw such workers away from the factories would be to leave to the breadwinners a fairer chance for the regulation of the wages which to them are a question of life and not of luxury. To pursue the industrial arts is not incompatible with home-making, and the decrease of home-making among women workers is one of the deplorable concomitants of factory life. Classes in these arts already exist; let them be multiplied till they are in Governmental hands, says Mrs. Van Vorst. Valuable hints on rational and adjusted diversion for the factory hands and a momentary fling at organized charity, such as we fancy may at times burst from the weary lips of the most scientific devotee, form other parts of Mrs. Van Vorst's message.

In Miss Van Vorst's story of the Southern mills we hear no more of girls working for luxuries. A hideous picture this of the mountaineers lured down to the mills by the overseers, by their own relatives even, to exchange ignorance and poverty for a scarcely lesser poverty with brutality and degeneration in addition. Where the original traits of this singularly unmixed American stock come out in the kindly boarding-house keepers and in the older generation, there is a fine and a hopeful racial side to be seen. In the rest, nothing of noble survives except sympathy for each other's pains and hurts—a picture of unrelieved misery and degradation, down to the children of whom the mill owners, even women mill owners, are found saying, "They like it!"

Robert Browning. [English Men of Letters.] By G. K. Chesterton. The Macmillan Co. 1903.

With something of deliberate intention, one is inclined to say, Mr. Chesterton has made a name for himself among the younger English critics as a master of epigram-

matic paradox, and this Life of Robert Browning does not belie his reputation. From the opening statement, that Browning's poetry is easily explained, whereas his life is obscure, to the equally paradoxical sentence which closes the last page, there is kept up an incessant rattling of intellectual surprises which will annoy or stimulate the reader according to his temperament. More than once Mr. Chesterton seems in this way to reach nimbly to the heart of some vexed question, as, for instance, when he maintains that the proper objection to the publication of the Browning Letters "is not the fact that they tell us about the love of the Brownings, but that they do not tell us about it"—which really, if read in connection, is not so paradoxical as it sounds. At other times he falls into mere extravagance or perversity. Who else would dare call 'Sordello' the most glorious compliment ever paid to the average man?

Even when he comes to sum up the value of Browning's work as a whole, Mr. Chesterton still indulges in paradox. 'The Ring and the Book' is "the great epic of the enormous importance of small things"; and in general, Browning's merit lies in "the apotheosis of the insignificant." Nor does Mr. Chesterton flinch the corollary. The exaggeration of the insignificant is properly the field of the grotesque, and with the serious use of the grotesque he finds that Browning's artistic originality chiefly concerned itself. Here, with due commendation, he alludes to Professor Santayana's remarkable essay on Walt Whitman and Browning. He does not intimate, however, that practically his whole thesis—his running comparison of Whitman and Browning, his theory of the grotesque, Browning's insistence upon pure passion and manner of speaking from within the storm centre of emotion rather than from without—is merely a larger writing out, with much original comment, to be sure, of Professor Santayana's argument. It is not exactly plagiarism, yet the later critical study could scarcely have existed without this basis.

But what quite relieves Mr. Chesterton of any charge of intellectual theft is the curious fact that, throughout the argument, he selects for praise just the points that to Professor Santayana gave warrant for final condemnation. To confront parallel passages from the two critics would thus afford a glimpse into a fundamental divergence of literary judgment. Only in one important matter do they differ in their reasons respectively for praise or blame. Mr. Chesterton insists rightly that Browning was a conscious and deliberate artist, and, recognizing the dependence of artistic effect on form, he points out how large a number of "novel and quite admirable artistic forms" Browning created. Professor Santayana, on the other hand, declares the essential trait of Browning to be formlessness. The broken parallel, however, is more apparent than real. The one is speaking of *forms*, the other of *form*. Thus, to Mr. Chesterton the form of a particular passage is unconnected with any inner law of restraint imposing its governance everywhere and working itself out in related harmony of expression; it arises rather from the poet's surrender to a particular emotion without thought of subordinating that emotion to a central scheme of reflection.

"The element of the grotesque in art," he says, "like the element of the grotesque in nature, means, in the main, energy; the energy which takes its own forms and goes its own way. Browning's verse, in so far as it is grotesque, is not complex or artificial; it is natural and in the legitimate tradition of nature. The verse sprawls like the trees, dances like the dust; it is ragged like the thunder-cloud, it is top-heavy like the toadstool."

Now this is precisely what Professor Santayana means by formlessness, what indeed his whole essay is written to condemn; and here as elsewhere the two critics bring out sharply that radical divergence of judgment based on the perception of the same qualities, which divides the readers of Browning into hostile camps.

As in the other volumes of this series, the greater part of the book is given up to criticism, while the events of Browning's life are passed over hurriedly. This is rather unfortunate for Mr. Chesterton, as he is always soundest and most convincing when he leaves abstract questions of literature for the problems of actual experience.

The Soil: An Introduction to the Scientific Study of the Growth of Crops. By A. D. Hall, M.A., Director of the Rothamstead Experiment Station. E. P. Dutton & Co. 1903.

Any publication originating in the Rothamstead Agricultural Station will be received with attention by those interested in agricultural research, with which that name, like those of Lawes, Gilbert, and Warington, has so long been honorably associated. Director Hall's book bears the same impress of conscientious, painstaking work that has become classic, and, dealing with the complex subject of the physical, chemical, and biological relations of the soil, supplies the student of rational agriculture, as well as the practical farmer, with a comprehensive treatise on the science and practice of crop production, written in as simple language as the subject will permit; affording also a glimpse at least of the latest investigations, and of the moot questions which render this field of research so attractive and fruitful from the scientific and the practical point of view. At the same time these less than 300 pages carry a salutary admonition to the student of the vastness of the field to be covered if he intends to "specialize" in the lines of scientific agriculture. Geology perhaps excepted, there is no equally broad field within what is commonly classed as a single subject in collegiate curricula; and the difficulty experienced by our colleges of agriculture in securing men of correspondingly broad qualifications for their staffs is eloquent of that fact.

While Mr. Hall's book takes its illustrations of principles and practice largely from agricultural conditions in England, it nevertheless contains copious references to those existing in other lands and climates, and gives full credit to the work done elsewhere—a habit unfortunately not as common nowadays as it used to be, despite accelerated communication and greater facilities of reference. This is, no doubt, largely due to excessive specialization unsupported by previous general culture, as is now the fashion. It would seem that the study of agricultural science should be a powerful antidote to excessive narrowness; and books like the one under consideration will go far both toward showing the farmer the advantages to be derived from governing his practice by scientific principles, and toward rendering him more tolerant of the Farmers' Institute lecturer who cannot answer offhand any question he may ask.

RENSEIGNEMENTS GÉNÉRAUX

L'Enseignement de l'Ecole des Sciences Politiques est le couronnement naturel de toute éducation libérale. Chacune de ses grandes divisions constitue en outre une préparation complète aux carrières d'Etat et aux examens ou concours qui en ouvrent l'entrée: (Diplomatie, Conseil d'Etat, Cour des Comptes, Inspection des Finances, Inspection des Colonies), et à des postes d'initiative ou de contrôle dans les grandes entreprises privées.

Les élèves sont admis sans examens, avec l'agrément du Directeur et du Conseil de l'Ecole; il n'ont à justifier d'aucun grade universitaire.

L'enseignement comprend un ensemble de cours répartis en deux années, mais la durée des études peut être étendue à trois ans. Un diplôme est délivré, en fin d'études, aux élèves qui ont subi avec succès les examen.

ANNEE SCOLAIRE 1903-1904.—L'année scolaire commencera le 9 novembre 1903 et finira le 7 juin 1904. On s'inscrira au Secrétariat à partir du 3 novembre 1903. **Inscription d'ensemble** donnant entrée à tous les cours et conférences réguliers et complémentaires et à la Bibliothèque (environ 25,000 volumes et 160 revues et journaux français et étrangers).....PAR ANNÉE: **300 fr.**

Une **Brochure spéciale** *donne des renseignements détaillés sur l'organisation de l'Ecole et sur les carrières auquelles elle prépare.*

Back Numbers of "The Nation."

In response to frequent inquiries from subscribers:

An incomplete set of THE NATION has little or no market value. Partial sets, bound and unbound, are always obtainable (usually lacking the earliest volumes), and do not command high rates. The bindings generally count for nothing, owing to great diversity of styles. Volume I. has readily brought $10 and upward when complete, bound or unbound, but it will bring very little in proportion if a single number is missing. Volumes II and III. are also scarce, but not so high-priced as the first.

Complete sets, both bound and unbound, have sold for $100, with tolerably quick bidders, and have an increasing value year by year.

Single numbers not more than a year old can usually be supplied by the publishers at 10 cents each. For numbers more than a year old purchasers are referred to H. Williams, 114 Fifth Ave, J. W Christopher, 47 Dey St., or A. S. Clark, 174 Fulton St., New York.

The publishers no longer undertake to buy or sell numbers or volumes more than a year old, and can only recommend sellers or purchasers to negotiate with a dealer or to advertise in THE NATION.

[Publication was begun July 1, 1865, Vol. I. comprising the last half year. Two volumes per year have since been issued, Vol. LXXVI. comprising the first half year of 1903.]

Miracles and Supernatural Religion

12 + 132 pp. 16mo, cloth, 75c. *net* (Postage 7c.)

Fiction

By Mr. JACK LONDON

The Call of the Wild

Illustrated in Colors by a new Process

"It is above all an absorbing tale of wild life, full of pictorial power and abounding in striking incidents of frontier town, camp and adventure."

Published this week. Cloth, $1.50

By Mr. JAMES LANE ALLEN

The Mettle of the Pasture

"It is so far Mr. Allen's masterpiece; a work of finished art. There can be no question of its supreme place in our literature; . . . more than any of his books it is destined to an enviable popularity."—JAMES MACARTHUR in *The Reader.*

Cloth, $1.50

By Mr. WILLIAM GARROTT BROWN

A Gentleman of the South

"A portrayal of Southern life in 'the black belt' before the war which stands alone in the strength and beauty and truth of its delineation."—*Courier-Journal.*

Illustrated, Cloth, $1.50. Limited edition (100 copies) on large paper, $6.00 *net.*

By Mrs. BANKS, *Author of "Oldfield"*

Round Anvil Rock

"The heroine will rank among the rare creations of fiction. The love story which runs through the novel is extremely well told and is idyllic in its purity and grace."—*The Outlook.*

Illustrated, Cloth, $1.50

By Miss OVERTON,

Author of "The Heritage of Unrest"

Anne Carmel

"One of the few very important novels of the year."—*The Sun*, New York.

Illustrated, Cloth, $1.50

From BARBARA'S

"Experience Book of a Commuter's Wife"

People of the Whirlpool

"It bubbles with humor, sparkles with common sense."—*The Brooklyn Eagle.*

Illustrated, Cloth, $1.50.

By Mr. CUTCLIFFE HYNE

Author of "Captain Kettle," etc.

Thompson's Progress

"A creation which the best of our novelists could not surpass."—*N. Y. Times's Sat. Review.*

"Far and away the best story which this author has yet written, . . . an original, vigorous, happy novel."—*Washington Times.*

Cloth, $1.50

In THE CITIZENS' LIBRARY

Railway Legislation in the United States By B. H. MEYER, Ph.D., University of Wisconsin.

Studies in the Evolution of Industrial Society. By RICHARD T. ELY, Ph.D., University of Wisconsin.

The Nation.

NEW YORK, THURSDAY, JULY 16, 1903.

The Week.

Governor Durbin of Indiana, the right man in the right place, is giving the country some valuable and needed instruction in the elements of government by law. His previous attitude towards the lynching spirit had been left in no uncertainty. Our readers will not have forgotten his prompt and exemplary removal of a sheriff, last year, for failure to defend a prisoner from the onset of a mob. That was a most salutary exercise of the power of the State Executive, and ought to have nerved the local authorities at Evansville to do all that they could to prevent the negro murderer, Brown, from being torn from the hands of the officers of the law by a mob thirsting for his blood. The Governor's resolute action in putting down with an iron hand the subsequent rioting was also that of a man equal to the obligations of his office; but an almost more exalted example of good citizenship he has given in his refusal to allow "even a guilty man to be railroaded to the gallows to satisfy public sentiment."

The more the Evansville riots are investigated, the more clearly does it appear that the city government was at fault. The Evansville *Courier* attributed the race troubles to wholesale colonization of low negroes for the purpose of voting them in herds in the interest of one party or another. The Indianapolis *News* states that the mob came into existence solely because of the political cowardice of the Mayor. "He expected," it says, "the State militia to come there and take the place of the city police, make arrests, and discharge all the functions of the civil law." The *News* also prints a letter from a prominent lawyer of Evansville, who declares that the city was turned over by the Mayor to the vicious elements. At the same time the writer points out that precisely the same conditions exist in Indianapolis, and urges its citizens to put their house in order against the test of their own virtue. In both cases it is the same old story of the "wide-open town," to which Mr. Charles F. Murphy and Mr. "Dry-Dollar" Sullivan would have New York return next January. Breweries are potent in their politics, saloons run unchecked, and gambling goes on without hindrance. In other words, there is the usual alliance of the authorities with crime for political purposes made possible by the indifference of business and professional men.

Calling things by their right names is a great help to clear thinking, and Mr. Justice Brewer's definition of lynching as pure murder is a word spoken in season. If there is to be a reaction against the mania of mob violence which has been sweeping over the country, it will come only as men in positions of authority boldly speak out their minds, as does this Justice of the Supreme Court, who brands as a murderer "every man who takes part in the burning or lynching of negroes." Let us hear no more about "rough justice" or the especial "code" of certain localities. Senator Foster of Louisiana had on Monday to plead with his fellow-citizens not to lynch a negro who was in the custody of the officers of the law. Even United States soldiers at Fort Leavenworth on the same date attempted to lynch a negro who had been in a fracas with one of their number. Where is this thing to stop? The fact that their regiments had seen service in the Philippines, and had there acquired the notion that "niggers" have no more rights than wild animals, should furnish food for thought to startled Imperialists who are wondering where the new ferocity against an "inferior" race got its fresh impulse.

At last we learn what it was that made President Roosevelt blunder into thinking that the negro is a man for a' that. He was "misled," says the Atlanta *Constitution*, by "a diseased sense of justice." This is certainly a new name for the instinctive manliness and passion for fair play which alone, it would appear, have moved Mr. Roosevelt in all his words and acts respecting the negro. He simply advocates a "square déal"—the same for black and white This is so impregnable a principle that no man, in a country based on equality before the law, dares openly to attack it. Even the *Constitution*, we see, admits that it looks like simple justice, but thinks it a kind of "diseased" justice. Why? And what sort of justice must that be which would shut the door of opportunity and of hope in the face of a man merely because he is black? To us that seems a justice not only diseased, but sick unto death.

Secretary Root has done tardy justice to Cuba in further reducing the number of United States troops in the island. Not since the American intervention has it been necessary for our soldiers to take the field or to fire a shot in defence of law and order. The Administration's insistence upon keeping troops in Cuba, despite President Palma's request that they be removed, has, therefore, been as unnecessary as it has been discourteous. Sporadic instances of brigandage continue to occur, but far less frequently than under Gen. Wood's Administration. In a review of a year's progress in Cuba, recently published in the *Independent*, Gen. James H. Wilson declared that the cities everywhere exhibited "the most satisfactory evidences of peace, tranquility, and reviving industry." There are still four companies of our artillery to remain in Cuba, with the understanding that they are soon to be transferred from Santiago and Havana to our naval stations. With their disappearance from these cities the Cubans will at least be freed from some outward signs of their governmental dependence upon the United States, as necessitated by the offensive Platt Amendment.

That ever cheerful optimist, Senator Lodge, is perfectly certain that, if the postal scandals are to have any effect whatever on the fortunes of the Republican party, it can be only favorable. That great organization has, we all know, long usurped the functions of Providence in the matter of crops and full dinner-pails. It would now seem that even its sins redound to its advantage. To understand this you have only to adopt the Senator's point of view. Dwell not upon the fact that there has been a gang of Republican rascals and thieves enriching themselves at the expense of the Government, but upon the fact that the party has found some of them out and is in the process of punishing them. It is plainly not a crime to cheat and defraud and steal, but only to fail to punish the wrongdoers. In accordance with this doctrine, the country is expected to sing a hymn of praise to Roosevelt and Payne, and forget everything else in so doing—incidentally, that nearly all the rascals were appointees of Republican Presidents. Perhaps we should all come to Senator Lodge's frame of mind more easily if we were so successful as he in obtaining favors from the Administration. Platt tells us now that Charles S. Francis of Troy wanted the ambassadorship to Italy, but that he was "thrown down hard." "The President said that Meyer was a personal friend of Lodge's, and that he could have the place as long as he wanted it."

By far the ablest study of the coming army General Staff is that contributed to the *Journal of the Military Service Institution* for July by Brig.-Gen. Theodore Schwan of the retired list. The creation of this body, he thinks, marks the summit of Secretary Root's remarkable contributions to the modernization

of the army. If it can be kept free from the taint of politics and service intrigue, General Schwan believes that it will afford a guarantee of the army's being kept abreast of modern requirements and of the country's needs. He points out with unanswerable arguments the hopelessness of expecting ten unrelated bureaus properly to conduct the military business of the War Office. As General Schwan says, much of the time of officers and clerks is now frittered away upon small details or purely routine matters which ought never to come before them, but which should be settled at the headquarters of the territorial departments. The absence of definite methods, definite aims, and coördinate control in both line and staff is once more clearly stated, along with many other weaknesses of the service, notably the failure to train officers of high rank in the handling of large bodies of troops. We do not remember ever to have seen, from the pen of an army officer, so admirable an exposition of the shortcomings of the army and its administration.

General Schwan sees danger ahead if the General Staff is not kept free from all scandal, and membership in it be not forever open to merit, and to merit alone. He would like to see it entrusted with the selection of names of officers to go before the President when there is any vacancy to be filled by appointment instead of by promotion in the regular order. With the cases of Funston, Wood, Grant, and other political favorites evidently in mind, General Schwan says that no one outside of the army can form any idea of the harm which results from a single bad or undeserved promotion. It is at once the signal for every officer who seeks advancement in other ways than by merit to "see" his Congressman or Senator, or strive for a position in the Department where he may bring himself under the notice of Mr. Root, or of Corbin, or General Carter, or some of the others in the seats of the mighty. General Schwan's suggestion that the President turn to the General Staff for advice as to appointments is excellent. In still other ways, too, his paper is a remarkable one, particularly because it comes from one of the civil-war veterans, many of whom, like General Miles, have opposed this and other reforms on account of conservatism or the memories of a bygone military age.

The proposed Joint General Staff, to be composed of staff officers of the army and navy, is a logical outcome of the whole movement in the two services for what are well called "thinking bodies." In a country so fortunately situated as we are, the navy, if it should ever come to another foreign war, must be the predominating military factor, just as in England. In that country the need of such a joint defence committee has long been felt, for army and navy have gone their respective ways with as little regard to one another as did our own War and Navy Departments in the palmy days of 1898. Spenser Wilkinson has for years been urging a joint war board, and it has also been one of the proposals of the Brodrick army reorganization, which has already failed so lamentably to bring about any genuine reforms. Lack of intelligent cooperation between army and navy was as striking a feature of the war with Spain as were the army's blunders about Santiago. The proposed joint organization need not be elaborate. What is wanted is simply a clearing house by which one service shall learn what the other is doing, and so avoid duplication of labor. In the coast defences the navy and army are brought into such close contact as practically to fight side by side. Moreover, it has never been settled where the navy's activities shall end and the army's begin. Should the task of patrolling the coast with signal men, for instance, lie with sailors or soldiers? During 1898 it was in the control of the navy. There are those who believe, indeed, that the whole matter of shore defence should be vested in the Navy Department. These and many other questions will be legitimate ones for the Joint General Staff to settle.

John Mitchell served notice on the country last week, when he visited the coal miners of Kansas, that the big Southwestern bituminous field is to become one of the outlying possessions of the United Mine Workers. The enthusiasm with which he was received by the miners would seem to indicate that this will not be a difficult conquest. There have been strikes, of a more or less serious character, in various fields of the Southwest, but as yet no general calling out of men to bring the operators to terms. The union movement has spread to the West along with the cartoons of farmers' automobiles and the introduction of the self-playing piano into the workingman's home. One point in President Mitchell's speech is worth noting, however. His emphatic declaration that "there is and shall be such a thing as industrial equality" between white and black miners was a square, manly utterance. If Mr. Mitchell can induce the miners of the Southwest to look with equal favor upon all union men, "white, black, red, or yellow," he will surely win a niche in the not overcrowded Hall of Fame of labor leaders.

Is it protection that sends up wages in the Kansas wheat fields to $3.25 and even $6 a day? The Iowa Republican platform asserted that it was the tariff which causes high wages; there is a duty on wheat—one of those delightful bits of humbug designed to fool the farmer—and we suppose that the strict Allisonian logic would see in the high wages of the Kansas harvester only one proof more of the blessings of McKinleyism plus Dingleyism. Others will be more struck with the picturesque details of the struggle for laborers. Kidnapped workers in the grain fields, the proudly efficient laborer auctioning himself off to the highest bidder—such features of the prairie "Harvest Home" certainly have their economic and social significance. So marked a dearth of labor is extraordinary. If we could only ship West a trainload of walking delegates, and have the desperate Kansas farmers flag the engine and take them off, the relief of the labor situation would be grateful both West and East.

Charles F. Murphy has issued an exceedingly adroit statement with the very evident intention of turning public attention from the doings of the old Dock Board to those of the new, but only to his own confusion in the case of Commissioner Hawkes. However, neither by attacking the present Dock Board nor by giving out selected figures to show that "treasury orders" instead of advertising for bids were used solely for the public benefit, can Murphy and his associates meet the serious charges upon which the pending investigation is based. There is not one detail in his long statement which really touches the subject of the inquiry. It is true that he says that the allegations of mismanagement made against the Dock Board "are, of course, absolutely groundless," but not one specific word is there about the Egan lease, the alleged tampering with the record so that the grant was made for thirty instead of three years, or any of the other instances of recklessness and apparent fraud in dealing with the city's property which have been brought out since the exposures began. A statement from Mr. Murphy covering some of these points would possess elements of real interest wholly lacking in the worthless document before us.

Notwithstanding the opposition of the Wisconsin Senate to direct primary legislation, we are informed that a bill was finally passed by the Legislature, referring to the people a direct primary law which will go into effect if accepted by the electorate. The referendum will take place at the general election in November of this year, and if the proposed law prevails it will operate for the first time in the election of 1904. The proposed statute has the usual features, but is more far-reaching than the primary laws adopted in other States. It provides for the nomination of the highest State officers by direct vote in the

primary, and also for the nomination of United States Senators in the same manner. The latter provision is a decided innovation, though it does not materially differ in principle from the practice in several States, notably Illinois, where State conventions have generally named a candidate for Senator.

In assuming the Presidency of the Board of Trustees, Mrs. Stanford merely emphasizes the proprietary character of the Stanford University, which was already pretty thoroughly understood. In fact, there is probably a gain in having the form of the university government agree with the reality. If, as the dispatches assert, the power of appointing professors is to be taken from President Jordan and given to the trustees, his position becomes that of chief employee, and it would be much more candid to dub him head clerk or acting manager of the corporation. Mrs. Stanford is within her rights in managing in her own way the university she has created. That she is wise many will doubt. Founders generally have been content to leave the control of educational gifts to experts, and those of them who have taken the other course have very rarely assured love, joy, or peace with their money and services.

According to the well-informed London correspondent of the Manchester *Guardian*, the American Monetary Commission left England after a complete failure of their mission, so far as that country is concerned. Our envoys had many interviews with high Government officials, but failed to convince them that the proposed plan was in any way feasible, if desirable. The British notion of the one way to bring the gold-using and silver-using countries into harmonious monetary relations is to compromise, but to compromise on the gold standard. It is wholly obvious that if Great Britain will not come into the scheme, it is doomed in advance. If Hong Kong and the Straits Settlements, to say nothing of India, are to be left out of the play, it will go but lamely, even if the other characters essay their assigned rôles. The Commissioners have, of course, gone to the Continent to see what can be done there; but if British finance will none of them, we are evidently at the end of one more attempt to "do something for silver."

Passive resistance to the Education Bill is assuming serious proportions in England. The policy and the word are not new. Forty years ago Nonconformists resisted the attempt to collect Church rates, and suffered imprisonment and legal confiscation of their goods until Church rates were abolished. In precisely the same spirit they refuse to-day to pay the proportion of the local taxes which is applied to education, holding, first, that the expenditure of the money is not wholly in the control of popularly elected bodies, and, second, that they cannot conscientiously contribute to support of the Church of England schools, the religious teaching of which they disapprove. On this ground thousands of the most sober and pious citizens of England have agreed to be haled to court and sold out rather than pay the school rate. The situation has seemed serious enough to call for two open letters from Mr. Balfour, but it is doubtful if his dialectics can persuade a single sturdy Evangelical to pay up and escape the sheriff. An issue is sharply drawn between church folk and chapel folk which it will be very awkward for the Government to meet, for this defiance of the law is considerate and undertaken in all conscientiousness. Dr. John Clifford, whose chattels have been sold for his school taxes, has pointed out in a reply to Mr. Balfour the practical injustice of the law.

In a season extraordinarily productive of international junketing, it is difficult to distinguish perfunctory visits of politeness from those which have diplomatic importance; but no observer of European affairs will fail to be impressed by the series of courtesies interchanged between France, England, and Italy. There were especial reasons why King Edward in Paris and President Loubet in London should each be sure of a personal welcome: for if one is not inaptly called "the Parisian King," the other might properly be called the English President. M. Loubet has that simplicity and dignity of character which are commoner in England than elsewhere. The tone of the press in both countries has been reserved and expectant as if there were some fear of embarrassing serious negotiations by indiscreet or perfunctory expressions. At present, there is nothing more to note than the drawing together of two countries whose alienation in the past has been as marked as irrational. This renewal of cordial relations comes happily at a time when many outstanding difficulties have been adjusted, and very naturally some hope to see the diplomats of France and England use the present era of good feeling as the basis of a more formal understanding.

Mr. Sidney Lee has written a letter to reassure those good people who had taken alarm lest the trustees of Shakspere's birthplace were about to desecrate "historic Henley Street." He shows that the buildings adjoining Shakspere's house are without architectural or archæological value; that they are in a ruinous condition; and that their removal will be a very great safeguard against fire. Mr. Lee adds that, with the exception of one or two houses, Henley Street, as Shakspere saw it, has long since ceased to exist. Yet the proposal to turn an old building now used as a china shop into a public library brought forth a frantic protest from Miss Marie Corelli; although, as Mr. Lee points out, the present street front not only is a modern brick affair, wholly out of keeping with anything Elizabethan, but is a piece of jerry-building which may collapse at any moment. So easy is it for the average person to regard as venerable and consecrated by tradition the things to which in his little lifetime he has become accustomed. Our readers may remember that, when it was proposed, some three years ago, to pull down the Church of Santa Maria Liberatrice, in the Roman Forum, a cry went up all over Europe. The Forum was being "desecrated." Yet this church was a seventeenth-century affair, in the sorriest baroque taste, and had nothing in the world to do with the Forum or with its history. When it was presently cleared away, the very first result was the priceless archæological discovery of the basilica of Santa Maria Antica.

The dying Pope is still denied a merciful release, but Cardinal Gibbons has sailed to participate in the inevitable Conclave. As he took ship he was asked if, in his opinion, "any American Cardinal" had a chance for the Papacy. Now, as Cardinal Gibbons is himself the only living American member of the Sacred College, the question was a glowing tribute to the naïveté of the reporter who put it. His Eminence is an adept in polite answers which convey nothing whatever. For instance, when he was last abroad, a French interviewer had a pleasing half-hour's talk with him, and extracted the information—that France was a beautiful country. But the fact remains that Cardinal Gibbons is a force seriously to be reckoned with in the next Conclave. Those who have lived in Rome cannot have failed to notice the extraordinary attention he attracts on the rare occasions of his visits there. This is but partly due to the personality of the prelate himself. The real significance of it lies in what he represents. He is at present the only Cardinal in North or South America. His vote, therefore, will be the vote, not merely of the nine millions of Catholics in this country, but of a hemisphere. It may be said that the Spanish Cardinals represent the views and interests of Central and South America. In a vague and distant fashion they do, but the connection is too remote to be worth discussing. But Cardinal Gibbons's influence does not end here. As Cardinal Vaughan is now dead, England will be unrepresented in the Conclave. The other two English-speaking Cardinals, Logue and Moran, are Irishmen. Cardinal Gibbons will thus in a way represent the Anglo-Saxon interests of the globe.

JUDGE PARKER ON THE FOURTEENTH AMENDMENT.

The address which Judge Alton B. Parker delivered on July 3 before the Bar Association of Georgia has been praised for its dignity and tact. It was more than tactful. An adroiter skating over thin ice, with the air of not even being aware that it was there, was never witnessed. For Judge Parker was speaking on a theme—the Fourteenth Amendment—which his hearers knew to be big with political consequences, yet he never once alluded to them! For him the great bulwark of the suffrage, with the penalties laid down for discrimination against any class in its exercise, simply did not exist. If wholly to avoid the burning question of the day is to show yourself a fit man for the Presidency, then Judge Parker's address should have sensibly advanced his candidacy.

The latter rests, as apparently does the projected Democratic campaign, upon just two phrases. They are: "Give us a rest," and "Let us alone." Do not bother us with your complaints about outraged human rights. Do not inquire whether the Constitutional guarantees are anywhere trampled upon. Do not ask if the equity between the States is violated by the systematic suppression of a whole class of votes in certain States, which yet claim their full representation. Judge Parker did not go so far as to maintain, with Mr. Dos Passos of the New York Bar, that the Fourteenth Amendment ought to be repealed; but he said that it could not now be reënacted, and the entire drift of his address was to the effect that the Supreme Court might be depended upon to declare void any legislation aiming to "fetter and degrade State Governments."

In reviewing the past decisions of that court under the Fourteenth Amendment (where he seemed to be pretty closely following Judge Brandon's monograph on that subject), Judge Parker was, of course, on safe ground. The Civil Rights cases made it clear that the Supreme Court would not tolerate the assumption that Congress could enact a social code for any State, or usurp any part of its police power. But all of that attempted legislation, with the decisions of the Supreme Court holding it void, came under the first section of the Fourteenth Amendment—that relating to "privileges and immunities." The second section remains. It reads:

> "When the right to vote at any election for the choice of electors for President and Vice-President of the United States, Representatives in Congress, the Executive and Judicial officers of the State, or the Members of the Legislature thereof, is denied to any of the male inhabitants of such States being twenty-one years of age and citizens of the United States, or in any way prejudiced, except for participation in the rebellion or any other crime, the basis of representation thereof shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State."

Congress has never adopted the "appropriate legislation" to carry out this part of the amendment. But that it has full power to do so, admits of no doubt. Piecing together various judicial decisions, Judge Brandon, in the work referred to, declares that while the Fourteenth and Fifteenth Amendments do not, of themselves, make an "affirmative grant or definition of suffrage," they do "unquestionably give A, a colored man, qualified to vote in all other respects save only color as B, a white man, a right to vote." "If, therefore," he adds, "State Constitution or law makes color a qualification of voting, it violates a privilege or immunity given the colored man." Of course, the disfranchising laws of the Southern States are cunningly devised. They do not openly state, though their framers are in general frank enough to avow it, that their intent and effect are to rob qualified negroes of the suffrage. It is possible, though we still hope not probable, that these laws can run the gauntlet of the Supreme Court. But Congress can take cognizance of the facts, if the court cannot. In Congress is vested the power to vindicate the citizenship of the United States, wherever it is discriminated against, and to punish, in the way pointed out by the Constitution, those States which set up one test of the suffrage for the white man, and another for the black. But, of course, nothing of all this was permitted to swim into the ken of Judge Parker, expectant candidate for the Presidency!

We are fully aware that there are differences of opinion, even among intelligent negroes, as to the wisdom of reducing representation to make up for the suppressed colored vote. Some fear that the South would acquiesce in the diminution of her political power, for the sake of keeping the negroes as a servile class, not as citizens, and that so the political rights of the negro would be even more hopelessly eclipsed than at present. But we do not believe that the South, despite some flourishes to that effect, would for a day consent to a lessened influence in the House of Representatives and in the Electoral College. Her conscience might be most effectively reached through her interest. In any case, here is a national duty, and the Fourteenth Amendment puts in our hands the instrument with which to execute it. We do not pretend to see in it a complete or final remedy; but it is the most immediate recourse; its use will be sure to fasten the attention of the whole country upon the fundamental questions of government and of morals involved in the wrongs done American citizenship in the persons of colored voters, and we think that a Republican Congress cannot afford to neglect this vital matter for a single day.

POLITICAL AGNOSTICS.

Current politics, in both England and the United States, reveals in certain phases a tendency to sponge the slate clean. We are familiar with the thing in individuals. Every young man wants to find it all out for himself. His own wild oats he considers it necessary to sow, despite the warning crop which his father can point to, fondly hoping that it will be sufficient for the family experience in that kind. It is not so often, however, that a whole generation, an entire nation, illustrates the same principle. The ancient wisdom of the wise ordinarily counts for more, or longer, in public affairs than in an impetuous private life. Great and stable political communities are not apt to speak of their established rules of taxation, or their fundamental theories of government, with the ingenuous ardor of the Irishman writing to the object of his adoration and signing himself, "Yours ever, for the present."

Yet there seem to be certain truths of the financial or fiscal order which each generation insists upon taking up anew. We know how we were put to our trumps in 1896 to prevent the country from disregarding the most elementary principles of monetary science. Men went up and down the land treating the experience of the race as if it did not exist. The past was *tabula rasa*. There was then frequently met among us the same easy assumption that we see in England to-day—namely, that a "belief" on the part of an active politician is as sound a basis of action as the consenting experience and teachings of all who have gone before. Mr. Bryan "claimed" that the free coinage of silver would not work disaster. In much the same way, Mr. Chamberlain gives it to-day as his "personal opinion" that preferential tariffs will not mean the harm to England that the economists and statesmen—including himself, until very lately—have predicted. Obviously, this is a kind of political sowing of wild oats. The people are asked to take the chances on one man's say-so.

This attitude, as Viscount Goschen pointed out in his acute speech on the Chamberlain proposals, involves a kind of agnosticism in economics. Certain things are thought to be settled, but Chamberlain says he doesn't know about that. With a fine air of intellectual emancipation, he says that he must not be asked to accept the infallibility of Bright and Cobden, of Mill and Ricardo. No; the only infallibility which he recommends is that of the man who doubts all the others, and is not yet sure of his own mind. But if we are going to abolish all authority and do away with every fiscal Pope, we cannot set up a new one the article of whose standing or falling church is: "I don't know, but I am going to inquire." Before we

brush away the past, it is necessary to have at least an assured present.

It seems strange to an American that the principles of 1846 should be so sharply challenged by Englishmen in 1903. Sir Michael Hicks-Beach stands firm, and so do Goschen and the Duke of Devonshire; but a surprising number of others are forgetting the warning of Sir Robert Peel that there would be need of endless vigilance to keep what the nation had wrested from selfish interests. But are not we on this side of the Atlantic displaying a similar political instability, and a weak amiability in allowing the pillared work of the past to be undermined? How about the American principles of 1861-65? There are certain truths which were thought through and fought through in those years. One of them is the equality of all men before the law. Another is that our Government has to deal with men as such, irrespective of the color of their skins, and that we can take no official cognizance of "superior" and "inferior" races among our citizenship. The terrible war carried successfully through by a former generation was not an idle contest to determine the supremacy of one section of the country over another, but to settle aright, and to settle for ever, the question of the sovereignty of the nation as a whole, and of the political principles upon which it was built. Our fathers went into that death struggle not merely to make an end of slavery, but to guarantee to the emancipated slaves every opportunity which a land of freedom can offer to any man. So they did not simply write into the organic law the abolition of slavery, but the safeguarding of all the political rights, and all the privileges and immunities, of our black fellow-citizens.

Now, it is upon this splendid body of political achievement that our own political agnostics are turning their backs with hesitating words about its all having been a mistake. The new American doughface will do to stand alongside the latter-day British protectionist. Both would undo the mighty work of a former generation. Both ignore the teaching past. It is a startling portent when Americans are to be found contemplating with equanimity the disfranchisement of a race, with the restoration of the old doctrine that this is a white man's country, and the tacit setting up of slavery again. If this change grew out of bold and positive convictions, we could better abide it; but it really springs out of the agnostic spirit, with all its limp uncertainties and aimless doubts. And what we may be sure of is that those who, in all this business of the new slavery, assert the thing which they do know—the truths which they have made their own in striving and with tears—will overcome, in the end, all who, in mere dubiety and love of ease, wish to put the whole great question by just as if Lincoln had not lived and died.

A SHORT VIEW OF BRIBERY.

The case of Rhode Island continues to attract public attention. At first people were shocked to learn of the extensive bribery by which a corrupt oligarchy owns the government and sells legislation to the highest bidder; now they are even more shocked to observe that the system is not merely tolerated, but is actually defended by some of the "best" people of the State, leaders of opinion. The daily press of the country is still echoing the defiance of the Aldrich-Brayton ring, uttered in the editorial columns of the Providence *Journal*. The argument for bribery rests on three contentions:

(1.) Bribery in Rhode Island is no more serious than elsewhere.

(2.) If it were not for bribery, Rhode Island might go Democratic.

(3.) Talk about government by majorities is shallow hypocrisy, for "there is not a State in the Union which is not now ruled by an oligarchy."

The first argument contains an infantile piece of sophistry which any Rhode Island schoolboy can detect. True, every State in the Union contains districts that are as venal as the notorious rural communities of Rhode Island; but the latter State is peculiar in that each town and city has one representative in the Senate, and thus some twenty little rotten boroughs control the Legislature. The purchase of these otherwise inconsequential constituencies absolutely nullifies the will of an overwhelming majority, and delivers Rhode Island, gagged and bound, into the clutch of the Aldrich-Brayton syndicate. In New York no such bribery is possible; even in Pennsylvania a revolt against the boss is not unknown; in Rhode Island the conditions are more serious than elsewhere because the majority seems helpless and hopeless. The first step towards freedom is a revision of the Constitution, so that a majority may rule. Such revision is bitterly opposed by the distinguished gentlemen who profit politically and financially from the present arrangement.

The second argument is an appeal to the prejudice of those fine old crusted New England Bourbons who hold that no crime is so black as that of being a Democrat. The complaint is that Bishop McVickar's crusade for higher civic morality will "play directly into the hands of the Democratic party." The hope of virtuous citizens, as represented by Senator Aldrich, is not that the Republicans shall purge themselves, but that Rhode Island shall continue to wallow in filth rather than overthrow the party of moral ideas. No doubt there are plenty of bad Democrats in Rhode Island, as elsewhere; and, unfortunately, some of the leaders of the organization are demagogues and socialists. Governor Garvin himself is accused of holding to the single-tax theory and other damnable heresies. These facts, however, constitute no valid plea for corruption. If the majority of the voters prefer demagogues and socialists in office, they are entitled to their choice, however painful it may be to gentlemen and scholars. The way to bring the electorate to a better mind is not wholesale bribery, but wholesale education.

The situation, however, is not so desperate as alarmed Republicans make out. Not all Rhode Island Democrats are dissolute and abandoned. Ex-Mayor Fitzgerald of Pawtucket is a cheap demagogue, as was shown by his cowardly surrender to the mob in the street railway strike; but rioting is not the only form of lawbreaking. The deliberate corruption of a commonwealth, whether accomplished by a United States Senator or by his agents, is quite as iniquitous. There is not much to choose between a cheap demagogue and a high-priced tool of corporations. Against Mr. Fitzgerald, however, may be set Congressman D. L. D. Granger, who is accepted by the most captious Republicans as the ideal of a heavy respectable. Indeed, the distress of the Republican ring is due largely to the course of the Democrats in putting forward men like Congressman Granger and Governor Garvin. The ferocious attacks upon the Governor by the ring and its newspaper organs are not at bottom on account of his opinions, but because he is honest, and is therefore a formidable menace to political hucksters.

To the declaration that republican institutions are a failure, there is but one answer: They are not a failure. A republican form of government has at times been overthrown in parts of the South, in Pennsylvania, Delaware, and Montana, in New York, and some other large cities. But in no place has corruption struck so deep that men need despair of eradicating it. Those fine bursts of enthusiasm with which the United States declared independence of Great Britain and emancipated the slaves are now in the past. We have settled down to the humdrum business of administering our affairs without brass bands and fireworks. As must inevitably happen, the comfortable and the well-to-do grow sleepy, while the rascals are incessantly vigilant. But the hour of reckoning comes. New York woke up in the autumn of 1901; St. Louis and the whole State of Missouri were roused from lethargy last winter; and enough people in Rhode Island are now stirring to give the big bosses and the little much trouble. No; among those who regard politics simply as a trade and public office as a source of private revenue, the cause for despair is not that republican institutions have failed,

but that they have succeeded. In the long run majorities rule, and in one way or another they get the men and the measures they want. The thieves and the cutthroats have their little day; but sooner or later honest people recover their own, with accumulated interest. This is the lesson which has been taught a thousand times over in the history of our country. Ten righteous men can yet save even such Sodoms as Rhode Island.

REORGANIZING THE INDUSTRIALS.

The arrival of the period of reorganization of capital in our so-called industrial Trusts is accepted by most people, we suppose, as the coming of the inevitable. Perhaps the strangest symptom of the excited Trust-building period, two or three years ago, was the frank recognition by the community at large that such a reckoning must come later. This belief did not stop the Trust-makers in their work, nor did it prevent the public from buying shares in the enterprises. Clear-headed foresight in such matters was applied chiefly to Trusts organized or owned by some one else. There was always something about the "industrial" in which a man was personally interested that distinguished it from the others. The stability of his own he had figured out; the rest very probably were destined to serious trouble. Added to this seductive reasoning was, of course, the argument that if so-and-so, with his well-known record for judgment and conservatism, was publicly connected with an enterprise, it could be safely taken at his valuation.

Now in all this there was nothing new. We know that England passed through the same experience ten years or so ago. The peers and M.P.s on its boards of directors gave the requisite guarantee, and the peculiar advantages of the rubber-tire industry, the bicycle industry, or the gold-mining industry—sworn to by chartered accountants—provided the needed assurance of immunity from misfortune. Our own experiments with capital have been conducted on a somewhat larger scale; otherwise, it is hard to see where they differ from these recent prototypes. It is true that distinctions may properly be drawn even between overcapitalized industrials. There is possibly some danger that, in its present mood, the public's denunciation may go too far. Within due limits, there was reason and trade advantage in industrial combination; its value has been attested in the recent conservative imitations by our English and German competitors. Even the much abused promoter, if he conducts his business honestly, may be as useful a member of the financial order as the banker and the broker. What we are witnessing nowadays, aside from the inevitable subsiding of the fictitious prices of a "boom," is the collapsing of structures raised by Trust-builders who were either incompetent, or infatuated, or simply dishonest.

Among many others we have in mind one enterprise, the history of whose promotion can find no parallel, so far as our memory serves us, since the days of Grant & Ward. Its history, if it ever comes to be fully written, will present to the public view lawyers of high reputation, and banking institutions of long-established credit, behaving, at a crisis in a negotiation involving tens of millions, with the intelligence which might be expected from a gullible child; allowing their clients to be tricked and defrauded by schemes that would not have deceived a Franklin Syndicate subscriber. That such an experiment should come to grief was inevitable. We do not believe that cases as bad as this were common. Every one knows, of course—it was the daily spectacle of Wall Street for a year or more—that the capital of some very important enterprises has been scattered and wasted in the most fantastic way, and on the most amazing scale, merely to keep up an artificial market for their stock. How far the mischief done in this direction is irreparable, depends upon how badly the wasted capital will be needed by the enterprise later on. But meantime there are some tests which all of our new industrials, good and bad, have met already or must meet in the very near future.

First among them is the need of what is known as working capital. A dozen manufacturing companies may be purchased by one central company, at a valuation reasonable or extravagant, as the case may be. So much is allowed for value of the plant, so much for that indefinite asset called "good will," so much for promoters' fees, so much, perhaps, for an "underwriting syndicate." Each of these payments will be made with the new securities issued by the Trust, or with money raised through sale of such securities. It will be observed that, in the above enumeration, no mention is made of sale of stock to acquire the capital to run the business. Such capital is, however, an absolute requisite. Without it, plant and good will are worthless, because the means of buying the raw material, paying the laborers, and bringing the produce to market will in its absence be wholly lacking. There is, therefore, in the ordinary industrial prospectus, some assurance regarding sums to be set aside from sale of the new securities with the view to providing working capital.

The sum thus set aside will vary with different undertakings. Some organizers will rely on borrowing from the banks, after the practice of individual owners from whom the various plants were bought. Some, either through ignorance or misrepresentation, will misjudge the amount of capital required. Some will trust to luck, planning only to get rid of their own interest in the scheme before the day of trouble. One or another of these three shoals has been the actual cause of wreck in nearly all of the disasters already on record. There are, it is true, some instances, such as the Asphalt Trust, where the enterprise was a fraud from the beginning, and was never able to earn the interest on its bonds. But these cases are probably rare; it is at least a question whether even the wretched Shipyard Trust affair belongs really in that category. The troubles which have developed this present season have arisen in the money market, where every inadequately equipped industrial is learning now, first, that the borrowing of $100,000 apiece by a hundred private manufacturers is a very different thing from borrowing $10,000,000 in a lump by one corporation; and, second, that banks which have loaned their credit fund to sustain prices for shares of industrial companies, are likely to have nothing left to provide such companies with working capital.

This is the sum and substance of the industrial chapter which has now begun, and which will not be ended until the worst mischief of the three or four past years has been repaired. It is fortunate that the forced reconstruction has begun before a general decline in prices of manufactured goods had confronted industrial companies with the problem of falling profits. Had that situation come in sight along with the strain on capital, we should have heard much less of reorganization than of bankruptcy. As it is, the investing public is fairly in a way to learn which of these new concerns are sound—as many unquestionably are—and which are rotten.

PROFESSIONAL COLLEGE COACHES.

A recent issue of the *Harvard Bulletin*, an organ of the Harvard alumni, contains a remarkable editorial article upon the question of the coaching of the Harvard crews, apropos of Yale's latest victory at New London. Harvard's failure to turn out winning eights has for years puzzled all interested in her athletic activity. Since 1885 her 'varsity crews have won but twice, in 1891 and 1899, and this is all the more remarkable in view of the fact that for five successive years her baseball nines have defeated those from New Haven, while her football teams have "broken even" with Yale's since the resumption of athletic relations in 1897.

Since 1901, a professional oarsman, Kennedy, has been in entire charge of the Yale crews. This year he also assumed control of the four-oar and of the freshman eight, with the result that Yale made a clean sweep in the annual meet. At the same time Cornell's professional, Courtney, added to his long string of victories by capturing all three

of the Poughkeepsie races. These facts naturally lead the *Harvard Bulletin* and other observers to believe that, in the long run, an amateur coach cannot begin to develop as good crews as a professional can turn out. If Harvard continues to stick to graduate coaching, the *Bulletin* is certain that her men must go to New London "with the expectation of defeat." "This," it believes, "is the situation that Harvard must face. In order to win her share of the races with Yale, while the latter employs a professional teacher of rowing, Harvard must also have a professional. There is no way of avoiding the issue." And it asks what Harvard is ready to do about this matter of coaching.

Its own question the *Bulletin* answers for itself in so admirable a manner that we reprint its very striking words, believing that they express the opinion of the majority of Harvard's graduates, and certainly of all devoted to pure amateur sport. The *Bulletin* hopes that

"those who are responsible for the conduct of Harvard athletics will stand firm for graduate, amateur coaching. It is not pleasant to be beaten by Yale year after year, but life is worth living even under those conditions. All Harvard men want to win our full share of victories, but, after all, the ultimate end of athletics is not to defeat Yale. If it were, then the employment of a professional coach would be wise. College sports are carried on for the purpose of benefiting the men who take part in them. If we can get all the good that should come from these contests and, in addition, win rather more than half of the events with Yale, well and good. But when it comes to deciding which is more to be desired, victory over Yale or the benefit of the Harvard men who take part in these contests and of the graduates who are interested, there should be no hesitation in choosing."

This utterance was to be expected from a university which for more than a decade past has worked incessantly for the elevation of intercollegiate contests. It ought, moreover, to cause considerable questioning at New Haven whether success purchased by aid of a professional is, after all, wholly a desirable success, and whether it would not be better to limit Mr. Kennedy's activity to teaching the rudiments of oarsmanship to undergraduates who do not go in for racing, as Mr. Donovan does at Harvard. The whole tendency of intercollegiate sport has been and is away from everything connected with professionalism. So far from resorting to more Courtneys and Kennedys, we hope to see them disappear entirely, and with them the professional teachers and coaches of baseball and football men. Any movement in the other direction would be deplorable if only because it is calling in outside aid. A Yale crew of to-day represents not purely the brain and brawn of the undergraduates of the college, but also the brain of an outsider who has not even the affiliations of a graduate, and who receives pay in exchange for his knowledge. The other objections to professional coaching have been stated too frequently to need repetition. We are firmly of opinion that there is no field of college athletics in which this coaching is not a menace and a detriment to amateur sport. We should like to see even the Donovans removed from college boating, and believe that Harvard should find other means of teaching the rudiments of rowing.

The *Harvard Bulletin's* profession of faith was particularly timely because Columbia was at the parting of the ways. Her graduates, in fact, on Thursday night put an end to professional crew coaching at their university. In this case, after an experience of three years, professional coaching had so clearly been found wanting that there was an overwhelming sentiment in favor of a return to genuine amateur methods. This decision cannot fail to have weight with the alumni of Yale and Cornell, and of the other colleges which are now the worst offenders in the matter of professional coaching. Moreover, the action foreshadows the disappearance of professional coaches from Columbia baseball as well. Thus Columbia, if her reformation becomes complete, will be in a position to set an example to Harvard, for that university has of late had a professional ball-player to train her pitchers. Columbia has found no difficulty in selecting an admirable graduate coach at once—Mr. Jasper T. Goodwin, a very successful oar in his undergraduate days, and for five years an equally successful coach. Yale and Cornell should have still less trouble, in view of their many well-trained crews of the last fifteen years, in getting similarly good men.

THE ELECTIVE SYSTEM AGAIN.

Not even the announcement of the final surrender of Yale to the elective system of studies has caused a cessation in the discussion of its working. That the principle has come to stay, no one denies. The trend at this time is still towards an unlimited choice of the courses embraced in a college curriculum, subject only to the limitations caused by a conflict of hours, or by the requirement that a student shall not enter an advanced course until he shall have passed out of an elementary one. So far there are no signs of a reaction in the direction of prescribing all the studies of a given period, such as the first two years of an undergraduate course. President Dwight of Yale believed this to be the solution of the problem long after Harvard had tried it and found it unsatisfactory, as his own university has since done. Such alterations as are now earnestly urged are a better system of faculty advisers, or the adoption of the group system of studies now in vogue in Bryn Mawr, among other colleges, and perhaps best exemplified in Johns Hopkins University.

There are plenty of proofs besides the recent speeches at the National Educational Conference in Boston of the growing realization that the mere throwing open of the collegiate pastures has not brought about an educational millennium. Our students browse now at will, and unquestionably with better results than when all were forced from one paddock into another. But few contend that the new system is perfect. Professor Ladd of Yale, always an opponent of unrestricted electives, declares in the *Forum* that extreme freedom of choice is not only extravagant, but "contrary to all the educational experience of the race"—this at the moment that his college is introducing the elective system into its freshman year by a vote of 18 to 3 among the academic professors.

Objections more valuable than the criticisms of an avowed opponent of the system are, however, to be gathered from the report of the class which was graduated from Harvard in 1893. Its members have been out of college long enough to have matured their judgments, and yet not so long as to have forgotten the influences of their undergraduate years. The class secretary, in sending out circulars to aid him in preparing his report, asked for criticisms of the college. A large number of men eagerly seized the occasion to express their dissatisfaction with the results of the elective system as they had experienced it. We have reason to know that if the question of satisfaction or dissatisfaction with the elective system had been specifically put, many more of the class would have registered their disapproval.

In the main, the critics find fault because they feel that their education was not well rounded. Unguided, they nibbled here and there, with much resultant breadth of vision, but with a firm grasp of few if any subjects, while those subjects may have been in no way correlated. The difficulties of many were excellently illustrated by this bit of 'Alice in Wonderland' philosophy, felicitously quoted by President Pritchett of the Institute of Technology at the Williams College commencement:

" 'Will you tell me, please, which way I ought to go from here?' asked Alice.
" 'That depends a good deal on where you want to get to,' said the Cat.
" 'I don't much care where,' said Alice.
" 'Then it doesn't matter which way you go,' said the Cat.
" 'So long as I get somewhere,' Alice added, as an explanation.
" 'Oh! you're sure to do *that*,' said the Cat, 'if you only walk long enough.' "

There are plenty of undergraduates who enter without knowing any more than Alice which way they want to go. Were they able to stay in college long enough, doubtless they might get somewhere. But, in the class report referred to, a practising physician declares that "the greater part of my courses were unwisely chosen." A professor at Bryn Mawr found "too much liberty," and now favors the group system. An instructor

at Brown warns against "the danger of choosing an incoherent course of study." A clergyman grieves over his failure to plan his course towards his life work, while an editor regrets the failure to direct his studies properly. Seven teachers, mostly in colleges, seven business men, six lawyers, three doctors, an architect, and a musician are others who clearly state their dissatisfaction, for one reason or another, with the elective system. Only the social conditions at Harvard and the lack of personal intercourse between professors and students are similarly criticised. Perhaps a half-dozen graduates give the elective system as their reason for entering Harvard in preference to other colleges. Plainly, it is not freedom of choice, but lack of advice how to choose, that is the trouble. Neither at Harvard nor elsewhere has a system of advisers been worked out which is really satisfactory in guiding the freshmen and sophomores into the proper paths.

We recur to the careful study of the elective system at Harvard in the current *Harvard Graduates' Magazine*. The courses chosen for examination were those of 372 men who did full work for a diploma in the class of 1901. Fewer than one-eighth of the choices were of studies known as "snap"—*i. e.*, particularly easy ones. Of these 372 men, 7.8 per cent. could be charged with undue specialization, but some of these had plainly shaped their courses with a view to the study of law. Dividing the subjects studied into groups, such as languages, social studies, and science, it was found that no one had failed to take some work in the linguistic group; that only two had failed to study in the sociological division; and that sixteen only had taken no science. Still other facts are presented which show that determined efforts were made by the students to seek out related courses. Advocates of the group system of studies who favor concentration upon a single class of subjects, or upon one branch of study and its allied courses, will find nothing in this to weaken their case. President Eliot himself has just defined the new ideal in education as the effort to teach a student one or two subjects thoroughly, and to give him a familiarity with as many other branches of learning as possible. The growth of knowledge renders no other course possible. But are Harvard students mastering their one or two studies in the present stage of the elective system?

CULIACAN, AND THE WAY THITHER.

MEXICO, 1903.

Here is a city which the tourist has not spoiled. Indeed, the tourist has not yet discovered Culiacan. It lies apart from the highways of commerce, in the centre of a great plain between the Sierra Madre and the Pacific Ocean, and the way thither is as thorny as the brambled shrubs and cacti that defend the dusty deserts which hem it in. The by-path leading into the Pacific States of Mexico sheers off from the Southern Pacific Railway at Benson, Arizona, a branch of the great transcontinental system, but operated under wholly different standards of comfort. The management seemingly have not carefully discriminated between passenger and cattle traffic. Even the Pullman palace cars are such as one sees in Canada under the name of "colonist cars," like them devoid of dressing rooms, and carrying a single roller towel for the accommodation of patrons on a most democratic, not to say communistic, basis. The standard of service, however, is the only point on which reductions have been made, the prices being retained on the profit-earning plane familiar to northern travellers.

The border is reached at Nogales, where other trials beset one. The railroads whose operations extend into Mexico, have not consulted the convenience of the public. It is possible to check baggage through to one's destination when crossing from the United States into Canada; not so when entering Mexico. To the worry of the custom-house inquisition is added the annoyance of rechecking baggage. If you stop over at the border to see the sentry-boxes down the broad avenue that divides the two republics, the same torments are scrupulously reserved for you. The customs officials refuse to examine your baggage until the next train comes in, and the railroad company refuses to recheck it until it has been examined. So turmoil, hurry-scurry, dust, and perspiration are part of the penalty exacted for entering the land of the tuna. The struggle has this of blessedness in it—one feels so comfortable after it is all over; the valleys look so placid and peaceful, the cacti so green and graceful, the brown and pink of the barren hills so artistic. The red flash of the peon's zarape in the field as he goads the oxen dragging his one-handled Asiatic plough, the line of women filing up from the waterside to yon brown, flat-roofed adobe house, arms curved gracefully to sustain water-jars upon their heads, entice one's thoughts to peaceful imaginations of having come face to face with Rebecca at the well, and of having seen Cyrus's gardener in far Chaldea.

It is useless feeding on dreams. This is not Asia, but Asiatic Mexico, a land of contrasts, a modern world clinging to ancient traditions through two lines of inheritance, an old world wrapped in the swaddling clothes of the new. It may not have been born again, but it is yielding to new influences, putting on a new life. Here is the railroad, for one thing, and there are American wagons beside the cumbersome ox-carts with their ponderous solid wheels. The cars emerge from a valley and swing round a bay where steamships lie at anchor, and there is a railroad wharf with signs of active commerce, while just beyond is the old mole of Guaymas. The city lies snugly packed in between the water and lofty peaks of bare but richly colored rocks. One peak appears to be a volcanic stock, round, tower-like, flanked by a talus of massive blocks, showing energetic denudation.

Guaymas is the port of the State of Sonora; a well-built, attractive city, comfortable enough in winter, but reputed to be hot in summer. Its harbor is large, completely land-locked, and safe. A line of steamships from San Francisco enables Guaymas to serve the needs of the mines of Sonora to some extent, while it enjoys a good trade down the west coast and with Lower California. Across the Gulf are the great copper mines of Santa Rosalia, where seven furnaces are treating the gaily tinted, oxidized Boleo ores for the benefit of French capitalists. A dreary, forbidding, but busy place is Santa Rosalia. The surrounding hills are innocent of vegetation. The streets are ankle-deep in sand. The wind hurls the sand in your face, and envelops you in clouds of suffocating smelter smoke. A mammoth dredge snorts and rattles its chains in the harbor, while a fussy little train carries the furnace slag to the end of the breakwater, building it farther out into the sea.

From Santa Rosalia the coast continues bare and inhospitable. Rarely can even a cactus find moisture enough to grow. The hills are worn down to the rock by the winds and the few torrential rains. Their crests are sharpened to pinnacles. Nowhere in the world exists a more pitiless desert. Yet it has its champions, men who believe in its future value to the world. There is El Boleo, the second greatest copper mine in Mexico, and farther south the silver mines of Triunfo, with a record of phenomenal richness. Why may there not be others? In La Paz they will tell alluring tales of wonderful prospects for copper, gold, silver, and petroleum, in these desert fastnesses, awaiting the touch of courageous capital.

La Paz is the chief mart of the great peninsula. It boasts a harbor, good enough to have attracted Uncle Sam to establish a coaling station. Under its sands lie sweet waters, and a multitude of windmills raise these to the surface to nourish a still greater multitude of date and cocoanut palms, and gardens full of figs and grapes. From the harbor, La Paz is almost ideally beautiful. The gleaming whitewashed buildings peep out from such a grove of palms as is rarely seen. It looks like some rich oasis, where the fabled delights of Scheherezade's fancy might be realized. But in the town this illusion is dispelled. The sun glares out of the blue heavens, gleams from the whitewashed walls, and its light and heat come reflected back with redoubled fury from the bottomless sand crunching under your feet. It takes fortitude and determination to push through the town to the plaza. Here is a refreshing bit of green, fed by a little stream raised from the depths by a diligent hot-air pump bearing the famous name of Ericsson. Before you retreat to the ship, the pearl sellers will have scented you as legitimate prey, for La Paz is the great American centre of pearl fishing. If you are a judge of gems, you may pick up a treasure. If not, you will fare worse than at home, for every urchin in the streets is an expert. In any case, you may be certain that you are buying stolen goods, for the pearl fisheries are controlled by licensed companies, producing solely for export.

From La Paz it is only a single night's steaming back again across the gulf to Altata, the port of Culiacan. It seems incredible that the way to an important and beautiful city should lie through such a miserable collection of palm-thatched huts.

Close down by the sea they huddle in a waste of parching sand. A few palms wave over them, and a few plucky bananas try to redeem the desolation. As the steamer comes to anchor, a cluster of canoes gathers at a respectful distance behind the boat of the port officials. When the ceremony of the visit is over, the dusky fellows in the canoes charge the ship with savage yells like a brood of pirates. Such competition for passengers betokens less a lively spirit of enterprise than a ravening hunger for a few reales to last until the next ship comes in. The port and the greeting of the boatmen are not reassuring, but the plain as it stretches eastward is seen to support some sort of bosky covering. Where vegetation of any sort can grow unaided by irrigation there is hope, and far away in the east is the blue bank of the Sierra Madre, with a gracefulness of outline showing at a glance that, whatever asperities may lurk within those mountain fastnesses, they at least have not, like the hills of Lower California, given up in despair and flung the last vestige of green from their shoulders.

Considering the isolation of Altata, it seems a little incongruous to find a railroad train standing in its sandy street. On the other hand, the railroad train is equally incongruous as a means of rapid transit in this twentieth century. The locomotive was made in England, fashioned approximately after the American model prevalent thirty years ago, squat as if fearing to lose its balance, with a mammoth bell-shaped smokestack. The passenger coach is a marvellous combination of rigid English trucks and Mexican carpentry, designed with strict reference to severe utility. The permanent way is better than the rolling-stock. Indeed, it must have been wisely located and well built, for it receives little attention to-day. Originally this Ferrocarril Occidental was intended to cross the mountains and effect a transcontinental connection. The location was made, and this much of the road constructed by Mr. Edward P. North, many years ago. Had the work been continued into the mountains, even if the more ambitious project of crossing them had been abandoned, Culiacan would have grown into a great centre, and might have distanced Mazatlan, in spite of some inferiority of geographical situation.

From Altata to Culiacan by rail is forty miles over a level plain, with only a single crossing of the sluggish Culiacan River. In lieu of a bridge, the track is laid on piles, so that during the period of floods communication is broken, and passengers and freight are ferried across. The ride is an experience never to be forgotten. The lagoons near the sea, the curious desert growth of acacias, palosblancos, and various cacti, soon lose their interest as the traveller becomes more and more absorbed in efforts to keep out the dust which pours upon him like an overwhelming rain of volcanic ashes. Suffocated, and weighted down with volumes of dust and sand, no enthusiasm can be his for the pretty glimpses of orange and banana orchards, nor for the broad canefields of Navolato. It is enough for the begrimed traveller patiently to await the journey's end; and when at last the great dome and towers of the Culiacan cathedral burst upon his view, he is as devoutly enraptured as any pilgrim when he hails the Mecca of his desire.

Perhaps it is this first glimpse, with the promise of rest and refreshment which it offers, that makes the cathedral linger so pleasantly in one's memory. But it is in reality a splendid structure, faultless in every line. It harbors no treasures of consequence, it possesses no thrilling history. It is merely the religious home of a devout multitude, expressive of a cultivated architectural taste among the clergy of a century past, and the chief glory of Culiacan to-day. Although of later Romanesque style, its gilded dome and graceful towers, almost like minarets in their lightness, are not out of keeping with the Oriental character of the other buildings which surround it; and when seen against the clear yellow and rose-madder skies of sunset, with the accompanying silhouettes of palms on either side, the picture is thoroughly Eastern.

Beside the cathedral lies the Plaza de Armas, a small square laid out in parterres, in which grows nearly every native plant of beauty, surrounded by bitter oranges, which cast a rich perfume, whether in the season of blossoms or gorgeous with yellow fruit. A few squares westward is the Plaza de Rosales, more modern in its appointments, now become the fashionable promenade. The Colegio de Rosales ornaments one side of the square, and on another the superb home of Gov. Cañedo gives a rare example of the best type of Mexican domestic architecture. It is of vast proportions, one story high, severely plain, but of elegant finish on the exterior, with one large, open room at the corner—the *mirada*—from which a charming view extends up the Humaya River, and over broad bottoms of waving corn, to the far-away blue mountains beyond the plain. Within, a great corridor opens upon a patio filled with palms and roses and other flowering plants. Beyond the patio a high wall shuts out the corral, which is surrounded by an extension of the house devoted to the servants. It thus possesses all the features of the typical Mexican dwelling, untinctured by the taste for American styles which is so rapidly pervading every department of Mexican life.

The college is an institution of no common merit. Dominated by the genius of Dr. Ruperto Paliza, a gentleman of broad culture and high attainments in science, it has not allowed the superficial and ornamental to overshadow the practical in its curriculum. The courses in mathematics, physics, and chemistry are rigid and thorough, aided by laboratories well equipped with modern appliances. The Escuela Modela de Porfirio Diaz is in very truth a model school, following French rather than American methods. In fact, French culture has firmly established its canons of taste in the intellectual development of this part of Mexico. The Industrial School is another institution in which all Culiacan takes special pride, a reformatory for little waifs where they are given a good elementary education, with instruction in useful trades and arts. The stranger, however, would be disposed to criticise the excessive use which is made of the Industrial School band. The little fellows are marvellously well trained, and they contribute very properly to the pleasure of the city by their evening concerts on the plazas, but it is going a step too far to draft them into service for the theatre and the bull-ring.

Of public works one sees but little. The city has never enjoyed a boom. The mines of the Sierra have contributed a small amount of business, but for the most part Culiacan is the distributing point for an agricultural population. It has grown slowly until it reckons about fifteen thousand inhabitants within its precincts, gathering its increment from the small towns of the coastal plain. So in a certain sense no new blood is added to it, and it has not been quickened by a progressive element to feel the need of modern improvements. It has a fitful service of electric lighting, and the city owns waterworks; but no attempt has been made to instal a sewerage system, nor has the stage of the bobtail mule car yet been reached, in which respect Culiacan has not kept pace with Guaymas. Some years ago an appropriation was made for a bridge across the river, but the funds were consumed in constructing the abutment on the city side of the stream, and so, when the waters are too high for fording, all cargo is still laboriously ferried across in rude canoes.

But if Culiacan is not progressive, it possesses a peculiar charm in the simplicity of life of its people. One sees less of the extreme contrast between rich and poor than in any other important Mexican city. The standard of living is not high, even as compared with the cities of the central plateau. The result is that the struggle for existence is tempered so that an easy frugality renders all classes comfortable. An air of peace and quiet pervades every quarter. Rowdyism is conspicuously absent, and one feels less that an autocratic Government had suppressed the natural instincts of the people than that they of their own accord were orderly and law-abiding. This characteristic pertains to the people throughout this portion of Mexico. Culiacan as the capital of Sinaloa only represents the peculiarity of the State. Life and property everywhere are safe. And it must be remembered that this is a part of Mexico which is farther removed from foreign influences than any other. Sinaloa to-day is perhaps the most distinctively Mexican State in the republic, and yet there is least in it that savors of swash-buckler romance. Picturesque costumes, gaudy liveries, dashing horsemen, do not exist. Even the marvellous hats with their gilt braid, so common still all the way from El Paso to the City of Mexico, are rarely seen in Culiacan. The seeker after novelties and curiosities will meet with disappointment here. The people for the most part are plain, everyday folk, intent upon getting enough of simple food and simple clothing to suffice for actual needs. A few families possess modest fortunes, but in nearly every case these fortunes have been the product of gradual accretions from generation to generation, so that their owners bear their riches gracefully without ostentation. Nearly every man of consequence in the city draws tribute from large estates in the country, and some have gathered wealth from the mines. Two families are interested in extensive sugar plantations, and one of these also operates a large cotton mill. But the Spanish-American is first and foremost a merchant, and almost every prominent name in Culiacan is connected with mercantile interests.

The professions are distinguished by some able representatives. The native physicians, as a rule, are men of high train-

ing and skill. The legal fraternity enjoys here, as elsewhere, its reputation for trickery, but there are lawyers in Culiacan of scrupulous integrity and of extensive learning. They will patiently labor, following the suggestions of their clients, as few lawyers in other parts of the world would do. It is easy for the foreigner here to find a legal guide who will keep him out of trouble. The existence of a complete code renders this a simpler matter than in the United States, especially as "case law" plays an inferior rôle in Mexico. It is only when the stranger falls into the hands of knaves that Mexican law presents inscrutable mysteries and complexities. The Mexicans are apparently by nature a litigious race, so that one cannot proceed far in any enterprise without facing the ordeal of the courts, but it is a gratification to feel that reliable and able advocates can be found to protect one, and outside of the criminal courts there is no discrimination against the "gringo." It must be said that the gringo often brings his troubles upon himself by not seeking legal advice before he casts some irrevocable die. The word gringo means "incomprehensible," and many of the foreigners' acts are beyond the comprehension of the native. If the gringo argues that the common law should apply all the world over, and that common law is equivalent to common sense, he soon confronts the fact that the aspect of things from the view-point of Anglo-Saxon common sense is but remotely connected with social, political, and legal phenomena as they reveal themselves to the Latin consciousness through the derivatives from Roman law and the Fuero Juzgo.

The foreigner in Culiacan will fare as well as any Mexican if he chooses not to fly in the face of the established order of things. He will meet with sincere cordiality on every side, and will find congenial, kindly natures, whom he will appreciate more and more as his intimacy with them increases. The simplicity of character of the average citizens of Culiacan is striking and refreshing, and can but leave a pleasant impression upon any visitor who has had the good fortune to come into close personal contact with them.

COURTENAY DE KALB.

Correspondence.

THE ETHICS OF BOOK-MAKING.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* of July 9 contains a letter from Mr. William Roscoe Thayer with reference to the increase in size of volumes 34 and 35 of the new edition of the 'Encyclopædia Britannica.' Perhaps the real reason for this increase in size is not due to the "great bulk of material," but the fact that the maps in volume 34 of the Encyclopædia are the same as those in the Century Atlas, which are too large to be satisfactorily printed on a page the size of the other volumes of the Encyclopædia.

Very truly yours, SAMUEL H. RANCK.

BALTIMORE, July 13, 1903.

Notes.

Houghton, Mifflin & Co.'s autumn list embraces 'Reminiscences of an Astronomer,' by Prof. Simon Newcomb; 'American Tariff Controversies in the Nineteenth Century,' by Edward Stanwood; and 'Ultimate Conceptions of Faith,' by Dr. George A. Gordon.

'The Rise and Progress of the Standard Oil Company,' by Gilbert Holland Montague, is in the press of Harper & Bros. This firm has just given general publicity to the privately printed 'Letters to M. G. and H. G. [the Misses Gladstone] by John Ruskin,' which we lately noticed in the English edition. The brief preface is by the Right Hon. George Wyndham. There is a portrait of Ruskin and of Mary Gladstone, and a facsimile.

James Pott & Co. will publish in September 'Budapest, the City of the Magyars,' by F. Berkeley Smith; 'Paris in '48,' by Baroness Bonde, edited by Constance E. Warr; and a 'Short History of the Ancient Greek Sculptors,' by Helen Edith Legge, with an introduction by Prof. Percy Gardner.

The Delegates of the Clarendon Press propose to supplement their facsimile of the Shakspere First Folio by publishing facsimile reproductions of the earliest accessible editions of that portion of Shakspere's work which found no place in the First Folio. The excluded portion consists of the four poetical quarto volumes: 'Venus and Adonis' (1593), 'Lucrece' (1594), 'The Passionate Pilgrim' (1599), and the Sonnets (1609), as well as the play of "Pericles," which was first published in quarto in 1609, but was not included in a collected edition of Shakspere's plays before the third folio edition of 1664. The four volumes of the poems and the volume of "Pericles" will be reproduced by the collotype process, and will be similar in all respects —size only excepted—to the collotype reproduction of the First Folio edition of the plays, published by the Delegates in December, 1902. This reprint will be executed under the direction of Mr. Sidney Lee, who will contribute full introductions containing the latest results of his researches with regard to the bibliography of Shakspere's poems and of the play of "Pericles." These reproductions will, it is hoped, be ready for publication in the autumn of 1904.

The Cumulative Index Co. of Cleveland has, in response to a general appeal, undertaken to revive its annual volumes, beginning with the year 1899. The intervening years to date will be similarly treated as soon as possible. Under a single alphabet we have the gleanings from fifty leading periodicals, embracing author, subject, title, review, portrait, illustration, and map. For example, articles on France are classified under thirteen headings, and each writer (where known) appears not only in connection with the article, but in the general alphabet, as does his theme, etc., etc. Poets have their verse collectively set down. This tool needs no praise. It is volume iv. in the series.

The utility of Dr. R. H. Knowles's 'Encyclopædia-Dictionary and Reference Handbook of the Ophthalmic Sciences' (New York: The Jewellers' Circular Publishing Co.) must not be judged by the English of the text or the erudition of the etymologies. Of D we read: "This letter stands in the Ophthalmic sciences for the word *dextra* [Latin, *dexter* or *dextra*= right], and with the letter O, abbreviation for the Latin word *oculus*=eye, means both together (O. D=*oculus dextra*), right eye." "Decentred Lens" is thus derived: "[Latin, *de* = away from + *center* = center+German, *lentil*= lens.]" For the rest, this work professes to be a pioneer. The longer articles are treatises; that on Operations describes a series filling eight and a half pages. Biographies are introduced: Dalton, Darwin, Donders, Franklin, Fraunhofer, Rittenhouse, but not Rowland. There are numerous illustrations.

The tenth volume of Cohen's 'System of Physiologic Therapeutics' (Philadelphia: Blakiston) has just appeared. It is occupied with Pneumotherapy, which includes Aerotherapy, or the influence of the atmosphere under different degrees of pressure, and Inhalation, or the application of vapors through the lungs. Treatment by inhaled drugs is a confessed deviation from the original plan of the System, but seems perfectly admissible. The section on tobacco attributes to its moderate use "a more agreeable humor and a quicker wit," and alleges that it "renders bodily and intellectual labor more easy, and increases one's resistance to fatigue," and that it favorably affects digestion. The writer adds: "We must admit that its good effects are largely counterbalanced by numerous troubles quite properly attributed to the abuse of tobacco, such as irritation of the mouth and pharynx, dyspeptic troubles ending in hypopepsia [diminished digestion], vertigo, loss of memory, tremor, amblyopia [dimness of vision], palpitation, myocarditis [inflammation of the muscle of the heart], and angina pectoris." "Largely counterbalanced" is a mild expression, unless "largely" means "much more than." One would scarcely like to balance amblyopia and angina pectoris against a more agreeable humor and a quicker wit. The volume is profusely illustrated with drawings of apparatus, and is carefully indexed.

The twenty-eight-page introduction to Dr. Frank G. Clemow's 'The Geography of Disease' (Cambridge [Eng.]: University Press; New York: Macmillan) is a luminous and philosophical disquisition upon the nature and the distribution of diseases. It is an excellent résumé of the methods by which classes of disease spread, and of their relation to places and peoples, and it may not be condensed or abstracted with any satisfaction. Nearly six hundred pages and a dozen maps that follow contain very well written and accurate accounts of the localities in which the main disorders are to be found, and of the extent to which these prevail. But the absence of an index does not permit one to select a place and then look up its endemics or epidemics. Given a disease, however, and its habitat appears. The essay on the distribution of malaria is particularly instructive. Until recently "malaria" has indicated a cause of disease, carrying on its face an hypothesis; and its application to the disease itself has been made with a looseness only to be tolerated among the ill-informed. Now that defined hæmatozoa are recognized as the essential cause, and especially that winged insects rather than air-currents are known to be the agents that spread the paroxysmal fevers, the name, as representing either cause or consequence, becomes peculiarly inappropriate. Nevertheless as "malarial" and "malarious" under the old hypothesis are so well

established in professional as well as in common speech, we may properly enough neglect the derivation and take no exception to Dr. Clemow's application of the arbitrary and non-descriptive popular term to the disease itself; and it may be adopted by the nosology as openly as the misnamed "cholera." There is an occasional error in American geography, and a reference to the Confederate army of 1866; but such slips are only to be noted as signs that no graver ones are conspicuous.

Attention should be called to the completion of the third volume of the folio 'Descriptive Atlas of the Cesnola Collection of Cypriote Antiquities' in the Metropolitan Museum of Central Park. The objects shown in this volume comprise those in gold, silver, bronze, iron, and lead, in rock crystal, glass, engraved gems, and inscribed cylinder seals, pottery from Egypt, alabaster and native stone, ivory and bone, with inscriptions in Phœnician, Cypriote, Greek, and Latin. The variety of the present volume is in marked contrast with the first and second in the series, which dealt with stone sculpture and pottery respectively. The effort has been made to represent all the patterns in each class, not to show all the objects in the collection. The letterpress accompanying the plates attempts to describe the objects in detail, including both the obvious features and any others which may have been discernible in the object itself only by the aid of a powerful glass. The arrangement of the plates is by the material of the objects, and the objects are grouped by subjects, not by the localities where found. The utmost accuracy in details is guaranteed by the fact that the reproductions were made by the aid of photography, the printing being done by the gelatine method. There are about thirty colored plates, comprising nearly all the objects in bronze. The entire set of volumes is sold by subscription only, and the edition is limited to two hundred copies, fifty of which stand in the name of the Museum. The printing has been in progress during the past twenty years. Gen. L. P. di Cesnola, Director of the Museum, prepared the first volume, which was published in Boston in 1885, and has maintained constant oversight of the two succeeding volumes, which bear the imprint of the Museum, in 1894 and 1903. In the preparation of the second volume the late Dr. Isaac H. Hall, curator of the Museum, had a large share; and in the third a similar task fell to the lot of Dr. Charles R. Gillett, librarian of the Union Theological Seminary.

David Nutt, London, has just issued, in very pretty dress, the 'Story of Cupid and Psyche,' rendered into very appropriate English from the Latin of Apuleius by Charles Stuttaford. There are four illustrations by Jessie Mothersole, two of which, facing pages 39 and 79, have very unfortunately been interchanged in the placing, so that neither has any relation to the immediate text. In three of the four illustrations it must also be said that the illustrator either has not read the story carefully, or has not endeavored to make the figure of Psyche correspond to the text.

Mr. Charles W. Wood, author of 'Norwegian Byways' (New York: The Macmillan Company), gives us less than a story of adventure or a record of travel, yet decidedly more than a guide book to certain unfrequented routes in Norway. With nothing thrilling in their experiences, the pair of travellers whose excursion is described enjoyed, and point the way for others to enjoy, much that was delightful both in the romantic scenery and in fellow-travellers. The narrative is in excellent taste, and will afford the reader a pleasant hour or two of summer reading, with real profit.

Miss N. H. Moore's 'The Old China Book' (F. A. Stokes Co.), albeit it treats largely of English and Oriental wares, is wholly for American readers, for it tells of pottery and porcelain of artistic, historical, or what used to be called "antick," value that can be gathered in America. It is of sufficient technical as well as descriptive value; with the aid of its instruction the most ignorant buyer should be able to gather an excellent collection of china—if he can find it to collect. But domestic sources of supply have been well hunted, well examined, and wholly depleted; no great collection could be gathered now save from established dealers who have buyers in England. The lists of old blue and white ware stamped with historical and pictorial designs fill many pages. They are arranged in natural divisions. Grouping the wares of each potter and each pottery replaces classification by the pictorial subject of the decoration as in other lists published by other authors, and is the better method, though not so convenient for the china-learner seeking to identify a specimen. Best of all would be a conjunction of both lists, with a system of cross-references. Omissions are few in this book, mistakes are few. The easy, familiar, almost colloquial style renders the text agreeable reading, and the explanatory descriptions, which touch on history, art, and literature, are all well done and informing. The illustrations are many, and some rare pieces are pictured.

A very sensible view of Tacitus, the man and the writer, is to be found in the latest work of the veteran Academician, Gaston Boissier ('Tacite,' Paris: Hachette). He has no sympathy with the notion, once so prevalent but now losing ground, that this historian worked at second hand, following pretty closely one main source. He shows, rather, that Tacitus was an independent investigator, even in his longer works, and, furthermore, that there is no reason to think that he desired a restoration of the Republic, or indeed that any Romans of consequence in the first century desired it. The main part of the book, which is written by this octogenarian with all the charm of style and yet scholarly exactness which has characterized Boissier's earlier works on classical subjects, comprises four chapters: how Tacitus became a historian, the conception of history in his time, his judgment of the Cæsars and his political opinions. Three others are added which have already been printed elsewhere: on Roman schools of oratory, on Roman methods of learning the news, and on Martial. The volume cannot be neglected either by students of Roman history or by readers who admire Tacitus for his own sake.

Constant readers of the *Jahrbuch der Deutschen Shakspeare-Gesellschaft*, the thirty-ninth volume of which ever-useful annual has just appeared, will miss in the current number one feature—the reprint of an Elizabethan minor drama—which has marked recent issues. Instead, we are offered this year two non-dramatic reprints, that of the poet Young's 'Conjectures on Original Composition' (1759), the inclusion of which is justified as a document in the history of Shakspere criticism, and that of a couple of sixteenth-century song books, Wynkyn de Worde's 'Song Booke' of 1530 (previously reprinted by Professor Flügel), and Thomas Whythorne's 'Songes of three, fower, and five Voyces,' of 1571, with facsimiles of portions of the musical setting. Two other articles will also appeal to American students of Elizabethan literature, that by A. S. W. Rosenbach on 'The Influence of the Celestina on the Early English Drama,' and the argument by Charles Crawford in favor of Kyd's authorship of 'Arden of Feversham.' The book reviews, notices of Shaksperiana, and bibliography, as usual, are complete and competent.

The Maryland Geological Survey has published the fourth volume of its general reports, containing information of much economic interest. The first part, "Palæozoic Appalachia, or the History of Maryland during the Palæozoic Time," by Bailey Willis, is a study of the physical changes which have taken place over a wide area, of which Maryland is a part, as recorded in the mechanical characteristics of the rocks. After explaining the processes which have wrought the changes, Mr. Willis gives an account of the growth and wasting of several mountain systems, the expansion of plains of continental extent, their gradual submergence, and the construction and migration of coextensive coastal plains. It describes the upfolding and dislocation of sedimentary strata from two to six miles thick in a zone a hundred miles wide and fifteen hundred miles long, and the withdrawal of the sea from territory over which it is believed to have extended many millions of years. In the "Second Report on the Highways of Maryland," by Harry Fielding Reid and A. N. Johnson, forming Part II. of the volume, is a discussion of certain changes in the testing of road materials devised in the laboratory of the Highway Division of the Survey. The results of several hundred tests of paving brick, cement, and road materials are set forth, and it is pointed out that much permanent improvement of the highways might be made by a proper use of available means without additional cost to the counties. The first portion of the "Report on the Clays of Maryland," by Heinrich Ries, forms the third part of the volume. The book is copiously illustrated, and presents the same elegant appearance which has characterized the previous volumes of the series.

The recent arrival in Cairo of the first consignment of cotton grown in the Sudan is a noteworthy event, not only as a proof of the beneficent effect of British rule in that region, but as the first fruits of a new cotton-raising country of unknown extent and productiveness. It is reported to be, in mercerizing qualities and in strength of fibre, superior to the best Egyptian cotton, but the length of the staple is somewhat shorter. This defect will probably be remedied in time by judicious crossing. As gold, iron, copper, and coal are also found in the Sudan, it is not impossible that in the near future this territory may develop a great mining industry.

The study of Chinese has been given an important impetus in Great Britain by a recent "Grace" of the senate of the University of Cambridge. It is now formally included in the Oriental Languages Tripos, and it will henceforth be possible to graduate with honors in that language alone, coupled with some knowledge of the general history of the Far East. The University possesses a large and extremely valuable Chinese library, and it is proposed to endow a scholarship in Chinese, as now being one of the important languages of the world.

—Some booksellers' catalogues, by reason of fulness of description, accuracy of collation, and elegant typography, have a known intrinsic value for collectors and librarians. Such conspicuously is the quarto designated Catalogus LIII., 'Monumenta Typographica,' just issued in Florence by Leo S. Olschki, the descriptive part in French. No fewer than 1,385 items are treated in geographical order in 472 pages, with the aid of numerous beautiful facsimiles of title-pages, colophons, marks, designs, ornaments, etc. The chief Latin classics are well represented; so are Jerome and Savonarola, Dante, Petrarch, and Boccaccio. The Petrarch list we have checked somewhat carefully, and found full of rarities. There is the first edition of the 'De Remediis' (1492), the first of 'Epistulae Familiares' (1492), the first of the 'Opera Latina' (1496), the 'Canzoniere' of 1501, on which Aldus first employed his Italic type, the Bologna 'Trionfi' of 1475, which our bookseller, *en connoisseur*, confidently ascribes to Ugo Rugerius and Doninus Bertochus of Reggio; and we leave unenumerated as many more which do not turn up every day. In the Dante lot we meet with the earliest edition of the 'Convivio' (1490); of the 'Divine Comedy' the first Aldine edition (1502), and the second (1515), the Florence edition (1481) with Landino's commentary and etched designs attributed to Botticelli, only partly carried out because of the difficulty of mating intaglio and relief printing, the Benvenuto da Imola commentary (1477), priced but a little below the Botticelli, etc. We need say no more, except that there is a table of authors, another of printers, a third of editions arranged in comparison with Hain, a fourth of illustrated books, and a fifth according to date of publication—from 1468 to 1500 only, though the latter date is transcended in fact. The collation is all that could be desired, nor are the prices prohibitory.

—It is curious to find American cities figuring as foreign cities; to learn, for example, that Chicago is "probably the fourth Polish city in the world," "undoubtedly the second Bohemian city in the world," the third Swedish, the third Norwegian city, etc. Through such expression of truths that do not emerge from the rehearsing of mere figures, Professor Buck, in his 'Sketch of the Linguistic Conditions of Chicago,' seeks to impress upon the American reader the immense foreign element sojourning in this land. This little study is replete with interest both to the linguist and to the sociologist. Perhaps the most significant fact brought out is the assured supremacy of the English tongue. Divided competition on the part of the foreign languages is partially responsible for this; but far more important is the domination of established folk-ways, which visit aberrations from the ideal with scornful epithets and contempt. The first generation knows little English, the second is bilingual, and the third is ordinarily unilingual with respect to the prevailing tongue. The process of absorption appears to be inevitable, and "is substantially the same everywhere." Scattered colonies alone retain the native idiom; and, curiously enough, here, in the new land, acquaintance may be first made with a native tongue; *e. g.*, many Irishmen learn Irish for the first time under the auspices of the Gaelic League. The author states that the linguistic babel of Cairo and Constantinople is of small moment as compared with that of Chicago; and yet, such is our enviable lot, there exists here no "language question" such as disturbs the tranquillity of large sections of Europe. Professor Buck's study is well worth the attention of students in all fields. It is issued by the University of Chicago Press.

—The fourth of the series of sub-reports to the Committee of Fifty which is investigating the Liquor Problem has just been published, Dr. J. S. Billings editor (Houghton, Mifflin & Co.). This treats of the physiological and pathological aspect of the case. The best that can be said for alcohol is that, under very favorable conditions and in limited quantities, it may be regarded as a food, and that the recognized pathological changes which follow its free use as a beverage, short of pronounced and continued excess, pass away when abstinence is resumed. Moderation means nothing beyond three ounces of spirits freely diluted, or four glasses of beer, taken with the last meals. More than that is excess, and trouble follows. The food value is exhibited practically only when disease or disability prevents the assimilation of other nutriment, and it should be used as such only by a physician's direction. The sub-committee holds that mental work is impaired and physical effort lessened by the use of alcohol, that it does not protect against cold or fatigue, and that it diminishes resistance to infectious diseases; and it admits without reserve, and with no assembling of formal evidence beyond what is, unfortunately, common observation, that alcoholic excess leads only to evil, moral and physical. The sub-committee very justly condemns the degree and the kind of attention that many States require to be given to this subject in the public schools. Not that it is unimportant: a clear knowledge of the action of alcohol is most important. But it should not be exalted into a study by itself, nor be taught, as now is the case, with misrepresentation of many of the facts. A very curious feature of the investigation is an analysis of many proprietary medicines and some drinks, advertised as "temperance," which range from 6 to 44.3 per cent. alcohol (a "wine" bitter has 47.5 per cent.), whose sale is large in prohibition and local-option States. This paper will be a valuable foundation for the final report of the Committee of Fifty.

—The one hundred and thirty volumes of Records of the War of the Rebellion are a mine of curious and instructive information, not only upon the well-known occurrences of the war, but concerning the inner life of the Confederacy and the minor romances of campaigns and regiments. Mr. John T. Bell of Oakland, Cal. (formerly of the Second Iowa Infantry), has compiled a thin volume of 'Civil War Stories' (San Francisco: Whitaker & Ray Co.), in which are condensed, with his own shrewd and judicious comments, a few of the phases of tragedy and comedy revealed by the Records. Among the chapters which have an especial interest now are those relating to the negro in the war and to General Sherman's opinions upon negro suffrage, as well as upon other subjects in which, according to his wont, he expressed his mind with great independence and often with striking foresight. Two days before Bull Run a communication was received by the Confederate War Department proposing negro regiments for Confederate service; but so revolutionary an idea received sanction by the desperate South only nineteen days before the surrender at Appomattox. Among those in the field who urged this measure was Gen. Patrick Cleburne, an officer of great courage, but the proposition was suppressed for the time, although, it would appear, often renewed in the field councils of officers. An amusing correspondence is printed between a Tennessee citizen and the Confederate Commissary Department upon the possibility of levying tribute upon the inland waters of the South, inaccessible to the enemy, for the supply of sufficient fish to make up the shortcomings of the army rations. Ten thousand men were to be detailed for the fishing, and women were to be set to salting the product; "if these men should average ten pounds each per day, it would supply enough for an army of 200,000." The reply of the Commissary-General recognized the humor of the proposition, and briefly set forth that, in the Government straits for supplies, this resource had not been forgotten, although a vigilant adversary had cruelly broken up some of the seacoast expeditions to this end.

—A Celtic Renaissance is a possibility in which few believe with ardor. Even Mr. W. B. Yeats, its most active apostle, writes in tentative language of the future of literature in "Ireland, where everything has failed." His 'Ideas of Good and Evil' (Macmillan), a score of short essays on poetry, the drama, and the Celtic movement, borrows its title from William Blake, of whom Mr. Yeats says much that is new and suggestive. Blake "was a man crying out for a mythology, and trying to make one because he could not find one to his hand. . . . If he had lived later, he would have taken his symbols from Norse mythology, . . . or have gone to Ireland—and he was probably an Irishman—and chosen for his symbols the sacred mountains, along whose sides the peasant still sees enchanted fires." What Mr. Yeats desires is that the Celtic movement should lead to "the opening of the great fountain of Gaelic legends." What Wagner and William Morris did for Norse mythology, what was done, by Malory and Tennyson and the rest, for the Arthurian legend, Mr. Yeats and his associates would fain do for the folk-literature of the Gaels. "I do not think with unbroken pleasure of our scholars who write about German writers or about periods of Greek history. I always remember that they could give us a number of little books which would tell, each book for some one country or some

one parish, the verses or the stories or the events that would make every lake or mountain a man can see from his own door an excitement in his imagination. I would have some of them leave that work of theirs which will never lack hands, and begin to dig in Ireland, the garden of the future." By the last sentence we are reminded of Mr. George Moore's 'Untilled Field.' Mr. Yeats believes, of course, with Matthew Arnold that the ideal genius is two-thirds Celt, and that English poetry owes its greatest beauties to the Celtic strain in its writers. He goes further, and looks to the Celtic movement to introduce into this non-creative age "the vivifying spirit of excess"—that excess which is so dear, so natural to the Celtic temperament that when Arnold attempted to differentiate the Celt from the Greek it was precisely in the Celtic lack of measure, which is an element in the Celtic "reaction against the despotism of fact," that he found the grand distinction. "The Celtic race," said Renan, "has worn itself out in mistaking dreams for realities." Mr. Yeats has cultivated a style which he says is himself. "I could not now write of any other country but Ireland, for my style has been shaped by the subjects I have worked on." His style is pleasing and dreamy, but we find nothing essentially Irish in it save a confusion of "shall" and "will" and "would" and "should" which the educated Irishman usually improves away. What Mr. Yeats lacks for the furtherance of his movement is the *vivida vis animi*, the Viking vigor of a William Morris. The genius of Wagner, the unwavering convictions of Morris—who will contribute these to the Celtic Renaissance?

—In his play "Where There Is Nothing" (Macmillan) Mr. Yeats boldly sets his hero on that "roadway of excess" which William Blake thought the shortest cut to the "palace of wisdom." "How splendid is the cup of my drunkenness," cries Paul Ruttledge, an Irish landowner, and forsakes his estate and his prosaic relatives for the open road and the society of "tinkers," the gypsies of Ireland. "Depend upon it," says his neighbor, Mr. Green, "he is going to write a book. There was a man who made quite a name for himself by sleeping in a casual ward." The tinkers can only suppose that Ruttledge is "wanted" by the police. A passion for the open road is not uncommon. But what Ruttledge sets out to do is to "destroy law and number, the laws and the Church, and at last the world itself." "I would like to have great iron claws, and to put them about the pillars, and pull till everything fell into pieces; then we would have more room to drink out of the drunken cup of life, . . . for where there is nothing, there is God." With the tinkers first, then as a monk, finally as a wandering preacher, Ruttledge is beset by this longing to pull down. But the "cup of drunkenness"—a recurring *motif* after the manner of Ibsen—is interpreted by him and his followers to mean free drinks for the whole village; his "vivifying excess" is an excess of porter, a Titanic defiance of petty sessions. Alas for the Dionysiac element sordidly embodied in drunken villagers and drunken police! We have been trained by Ibsen to put off our Philistinism now and again in order to understand, if we can, the point of view of those whose eyes are so fiercely fixed on the ideal that they cannot play the trivial and orderly game of life. The reader of this play, recognizing the symbolism of Ibsen and Maeterlinck, and careful not to range himself with the hero's scandalized relatives, must regret, nevertheless, that Mr. Yeats should assume the rôle of an Irish Ibsen. The Celt in literature has so far been a creditor; it is not by borrowing the Scandinavian method that Irish writers will further a Celtic Renaissance.

—We called attention on their appearance to the first two volumes of Senator Luigi Chiala's 'Giacomo Dina e l'Opera sua nelle Vicende del Risorgimento Italiano.' The third volume, which has just been issued, completes the work (Turin: Roux & Viarengo), and covers the period 1866-1879. Dina's career as a journalist in Italy is comparable to that of Mr. Godkin in America. For thirty years he played the part of an independent, fearless editor, a real shaper of public opinion, who told his readers what he believed they ought to hear, not what they wished to hear. He had not Mr. Godkin's great gift of irony, nor his engaging style, but he had equal sincerity and an equal recognition of education, of letting in the light, as the chief means of helping his countrymen to profit by their political independence. Senator Chiala follows in this volume the plan he adopted for its predecessors, of giving large extracts from Dina's editorial leaders, and of connecting or explaining them by a running commentary. In this way every important political event in Italy during fourteen critical years is passed in review, and, besides Dina's articles in *L'Opinione*, we see letters from statesmen of various groups—for, although Dina was a Liberal of the Cavourian school, he had friends in other parties. The work throws light on international politics—on the war of 1866, for instance, on the relations of Italy with Napoleon III., and on the Papal Question—and will necessarily be consulted by students of those episodes. Incidentally, it rouses our sympathy for Dina the man, not less than our admiration for Dina the great editor.

LIDDELL'S MACBETH.

The Tragedie of Macbeth: A New Edition of Shakspere's Works, with critical text in Elizabethan English, and brief notes illustrative of Elizabethan life, thought, and idiom. By Mark Harvey Liddell. [The Elizabethan Shakspere.] Doubleday, Page & Co. 1903. 4to, xxxiii., 247.

The present volume is the first of what is certainly the most ambitious edition of Shakspere so far produced in this country. The publishers announce it as being, in the opinion of connoisseurs, perhaps "the most beautiful set of books ever issued from an American press," and Mr. De Vinne, who has designed the type on a fifteenth-century model, regards it as his "best workmanship in typography." The style of composition revives a difficult and elaborate method of the fifteenth century, the notes forming a frame to the text on each page. The claims made for the scholarship of the edition are no less high. The editor regards himself as a pioneer in presenting the text in what he calls "Elizabethan idiom," and in interpreting it in the sense of that idiom; and he has brought an imposing apparatus to the accomplishment of his task. A work thus heralded challenges a somewhat close examination of its claims.

It is difficult to understand what constituency the publishers have had in view in this enterprise. "The *perfect* Shakspere thus far," without which "the average man cannot read the plays intelligently," is published in an *édition de luxe*, limited to two hundred and fifty copies, and costing $500 a set. But such editions are not usually meant for the average man; and the millionaires and collectors who buy them are not likely to plod through the mass of minute linguistic information with which the pages are loaded. If the notes are to be a contribution to scholarship, it is a pity that the size and cost of the edition will make it inaccessible to all but a few of the more wealthy libraries and private scholars.

Picturesquely considered, the book is very magnificent. The new De Vinne type is beautiful in design and easy to read, and some of the pages are very successful. Frequently, however, the necessities of scene division and the like cut up the page and spoil its symmetry, and the length of line (added to the close "leading") in the smaller type of the notes is too great for ease of reading when it runs right across the large quarto page. The device of framing the text in the notes, however decorative, is disappointing to the student. In nine cases out of ten the notes run well over on the page following, often, of course, over the leaf, and the lack of paragraphing makes any one note hard to find. On the whole, one is bound to feel that the artistic results of the arrangement are not decided enough to counterbalance the costliness and inconvenience.

The theory on which Mr. Liddell has determined his text is due to his belief that "in the nineteenth century as well as in the eighteenth Shakspere has invariably, save in the case of Dr. Furness's Variorum, which copies the First Folio *punctuatim et literatim*, been modernized and transliterated into the current idiom." He forgets that it is only in the later volumes that Dr. Furness adheres to the First Folio. The reader will perceive, too, that here, as throughout the volume, the word "idiom" is used meaning little more than spelling, for Mr. Liddell himself abandons freely the punctuation, capitalization and typographical peculiarities of the Folio, changes the division into scenes and the stage directions, and emends the text, while preserving the spelling; and it is absurd to speak of standard texts like that of the Cambridge Shakespere as "translations" from Elizabethan into modern "idiom," as we ordinarily understand the words. The value of preserving the Folio spelling is, despite Mr. Liddell's insistence, very doubtful. He himself remarks, in correcting in his text the form "ha's" to "has": "The Folio reads *ha's*, as often; but this is a mere gratuitous piece of philological information—and incorrect as such information usually is—on the part of the printer, who seems to have supposed that 'has' was formed from 'haves' by dropping the *ve*." But this criticism applies constantly to the Folio spelling, which of course has no authority but that of an unknown seventeenth-century compositor. The peculiarities and inconsis-

tencies so carefully preserved are oftener misleading than philologically significant. And even Mr. Liddell tampers with the spelling. Not only does he modernize words like "ha's," but he takes the liberty of reading "th' set," "th' fogge," for the Folio "the set," "the fogge," and "enterance" for the Folio (and modern) "entrance," in order to make the verse conform to his own sense of rhythm. Thus the advantages of an exact reprint are sacrificed without the compensation of getting rid of the erratic spelling of the early seventeenth century.

The notes give evidence of much careful reading in Elizabethan literature, the gatherings from which have been poured into the present volume without stint. The glossaries of the seventeenth and eighteenth centuries and the New English Dictionary have been used probably more systematically than in any previous edition, and much interesting, if not always relevant, linguistic information has been derived. But the editor's erudition far outstrips his judgment, so that there are astonishingly few interpretations made in the light of these illustrative quotations which are at once novel and convincing. As an example of this part of his work, take his treatment of the lines in "Macbeth," I. 2:

> "The merciless Macdonwald
> (Worthy to be a rebel, for to that
> The multiplying villanies of nature
> Do swarm upon him) from the Western Isles
> Of kerns and gallowglasses is supplied."

The usual interpretation is that the speaker regards Macdonwald's rebelliousness as a natural outcome of his vicious traits. But Mr. Liddell says, "*That* seems to refer to the rebels' mercilessness, with *to* in its common El. [Elizabethan] sense of 'besides.'" Further, the "*multiplying villanies of nature* are 'the kerns and gallowglasses' themselves, and not vicious aspects of Macdonwald's character." This is supported by quotations to show that "beastly behavior" was characteristic of kerns and gallowglasses, that "*swarm* is not elsewhere by Shakspere used with reference to abstract qualities, but refers to the gathering of mobs," and that "multiplying, too, generally means 'prolific, not multiplied.'" A careful comparison of this learned ingenuity with the passage itself is a sufficient refutation.

Mr. Liddell is so profoundly impressed with the difference between Elizabethan and modern English that he is constantly forcing the sense of Shakspere's language away from modern English; while, on the other hand, he views the connotation of modern English as mechanical and impoverished, like a foreigner who is ignorant of our colloquial speech. This defect will be particularly annoying to Shakspere scholars who have been accustomed to plead for a serious study of Elizabethan idiom, and who here find their case spoiled by over-statement. This tendency is so pervasive in the edition that it calls for illustration. On Lady Macbeth's words, "Yet doe I feare thy nature; It is too full o' th' milk of humane kindnesse," etc., he says, "Nature has here its usual Elizabethan meaning of 'character,' cp. I. 3. 137." On Banquo's words, "Th' heaven's breath Smells wooingly here," he says, "*Smells* seems in Elizabethan English to have meant 'breathes upon,' cp. Florio, *'oreggiare*, to breathe, to blow as aire or winde, to sent, or smell pleasantly'; cp., too, 'The ayre breathes upon us here most sweetly,' Temp. II., i. 46." But the quotation from Florio does not prove that "smells" in Banquo's speech means anything but what the modern reader would suppose; and the whole passage is typical of a peculiarity of frequent occurrence in Mr. Liddell's use of his authorities, viz., the assumption that all the words used in a glossary to explain a given term are synonyms of one another. Again, on Lady Macbeth's "What beast was't then That made you breake this enterprize to me?" he writes, "*Breake* is Elizabethan English for 'disclose,' cp. 'therefore . . . Katherine, breake thy minde to me in broken English,' Hen. V., V. 2. 265." "To be counsail'd" is an Elizabethan phrase meaning "to take advice," cp. "pray be counsail'd," *i. e.*, "take my advice," Cor. III., 2. 25" (p. 59). "*Scales* in Elizabethan English are the scale-pans of the balance" (p. 72). "*How goes the world?* is an Elizabethan conventional expression meaning 'What's the news?' as in Tam. of Shr. IV., i. 35 (cited by Delius); in Phr. Gen. it is translated by *quid novi*" (p. 87). Examples of this implied denial of ordinary modern meanings are found constantly, and the notes are burdened with such unnecessary matter. The inference that is forced upon one is that for the completing of his equipment the editor needs to familiarize himself with the modern usage of English, both literary and colloquial. The peculiarities of his own style, like the use of "idiom" already noted, his persistent employment of "verbiage" for "diction," and similar oddities of expression, strengthen this inference.

Both in the notes and in the introduction considerable space is devoted to æsthetic criticism, and this is often interesting and suggestive. Mr. Liddell regards the *motif* of "Macbeth" as "essentially the same with that of the Heracles Mainomenos of Euripides, or that of the classic and mediæval story of Hercules Furens, or that of the mediæval and modern Faust legend." The witches he interprets as powers of evil corresponding to the Furies that invade the soul of Hercules, and he dwells throughout on the conception of Macbeth as insane, as devil-possessed, as an ambitious man "bargaining with the devil and selling his soul in exchange for power." It is not quite clear how far he regards these three states as identical; and indeed in his whole treatment of Shakspere's great tragic heroes, Hamlet, Lear, Othello, and Macbeth, as insane, there is some indistinctness in his use of the term.

In "Macbeth" Mr. Liddell finds a peculiar external unity of form "secured by the insertion of narrative scenes between the several acts of the play to serve the purposes of the Greek chorus," and this choral element he emphasizes again and again. But when one considers that such narrative scenes occur frequently in the Elizabethan drama as a somewhat obvious device for giving information not easily presented in true dramatic form, that they occur in the middle of acts in "Macbeth" itself (*e. g.*, the bleeding sergeant, I. 2), that no such scene occurs between acts I. and II., and that the spectator attitude so essential to the chorus is absent, it is hard to feel that there is more than a vague analogy between the purpose of such scenes and the functions of the chorus. The mere absence of underplot, the singleness of the theme of Macbeth's internal development and external career, is an easier explanation of the marked unity of the play. In spite of such criticisms, however, Mr. Liddell's study of the plot and the characters has produced valuable results, and his interpretations are given with enthusiasm and eloquence. The edition is furnished with an admirably full glossarial index.

When the attempt is made to gain legitimate prestige by issuing editions of the great classics, by giving these a worthy and even a splendid material form, and by employing a scholarly editor, one is bound to meet it with approval and sympathy. It is with the more regret, then, that we find ourselves forced to draw attention to what appears to us the lack of sound judgment both in the publishers' conception of the fitness of the contents of an edition to the public selected by its price, and in the editor's use of his undoubted erudition.

THE STREETS OF LONDON.

Highways and Byways in London. By Mrs. E. T. Cooke. With Illustrations by Hugh Thomson and F. L. Griggs. The Macmillan Co. 1902.

It has been said that in order to be a good biographer it is necessary to have a profound enthusiasm for the subject to be portrayed. If this quality is also necessary for topography, Mrs. Cooke is eminently qualified for her task, for enthusiasm she has to a superlative degree. She knows London thoroughly well, and the people of all classes who are to be met with in its highways and byways, and she writes of them with understanding and with a fine sense of humor, for this is not a guide book to places and monuments merely: it goes much farther, carrying one into the very life of the people, besides telling us so much about the town and all its ways.

The Londoner, born and bred, generally bent on business when in the street, is not observant by nature; he hurries along with eyes on the ground, his chief preoccupation being to cover space as quickly as possible, so great are the distances and time so valuable. The dull, uniform streets or crowded thoroughfares do not reveal to him their connection with the interesting people who have lived and suffered in them, leaving their mark on the world, nor has he the advantage of the traveller in a Baedeker for companion of his walks. Therefore to Londoners especially this book will bring enlightenment and invest even mean streets with their associations with the past. For travellers also it has its special advantages, since it contains innumerable quotations from great writers whose impressions one likes to note and to have together ready to look up at the right moment.

Mrs. Cooke has a deep conviction that everything is for the best in her native city; she would not even dispense with the soot and grime, in which she sees "a mellowing, softening, harmonizing effect on the architecture and street monuments." We cannot agree with her in calling soot "an artistic value," although such statuary as is to be met with in the squares and parks, the lions in Trafalgar Square, and the deplorable caryatids of St. Pancras Church lose nothing by being covered with a veil

of blackness; but it does seem a little too much, after lauding the architecture of St. Paul's, to rejoice in its festoons of blackened roses. In a well-conceived design everything is intended, not left to chance effects of climate; therefore, to say that St. Paul's is "blackening ever year by year, yet gaining immeasurably through that very blackness," is poor praise to Wren, who had not counted on this effect. Hawthorne shares Mrs. Cooke's opinion. "There can not," he writes, "be anything else in its way so good in the world as just this effect of St. Paul's in the very heart and densest tumult of London. It is much better than staring white; the edifice would not be nearly so grand without this drapery of black." We are told the cost of the building was defrayed by a tax on all coals brought into the port of London, so that it gets its blackness by right. This grime is at all events a well-established fact, which has to be accepted.

Mr. G. A. Sala also is in favor of the smoky chimneys. He says about St. Paul's: "It is really the better for all the incense which all the chimneys since the time of Wren have offered at its shrine, and are still flinging up every day from their foul and grimy censers." As a flower of speech, this is good; but as criticism it is equivalent to saying the less seen of it the better. M. Taine, the French critic, evidently thinks otherwise; he writes of Somerset House:

"A frightful thing is the huge palace in the Strand which is called Somerset House. Massive and heavy piece of architecture, of which the hollows are inked, the porticoes blackened with soot, where in the cavity of the empty court is a sham fountain without water, pools of water on the pavement, long rows of closed windows. What can they possibly do in these catacombs? It seems as if the livid and sooty fog had even befouled the verdure of the parks. But what most offends the eyes are the colonnades, peristyles, Grecian ornaments, mouldings and wreaths of the houses, all bathed in soot. Poor antique architecture—what is it doing in such a climate?"

No wonder the pretentious Georgian and early Victorian stucco style, so unsuitable for the moderate-sized house, found little favor with the French critic. The present fashion for red brick and terra-cotta, with large casements, inaugurated by Philip Webb and Norman Shaw is certainly more agreeable to the eye and better adapted for the homes of middle-class people. To decide what style of architecture prevails in the medley of different periods constituting London, is indeed difficult. Our authoress concludes that the "dark house in the long, unlovely street" which Tennyson tells of and Mme. de Staël vituperates, covers the greater number of acres. The fact is, each of the districts constituting London as it now is, *i. e.*, Belgravia, Tyburnia, Bayswater, Kensington, Chelsea, etc., etc., has the impress and character of the time of its greatest popularity and fashion and of the class by which it was principally inhabited. As Mrs. Cooke justly says: "It has always been the city's fate to have its past overgrown and stifled by the enthralling energy and life of the present. It is as a hive that has never been emptied of its successive swarms. This is more or less the fate of all towns that live."

It was not till Elizabeth's time that there were as many houses outside the city walls as within them. The first map of London published in 1563 by Ralph Ugga shows the same thoroughfares existing now—the Strand, "Chepe" and Fleet. In a later map of 1610, London and Westminster appear as small neighboring towns with fields around them; Totten Court, a country village; Kensington and Marylebone secluded hamlets; Clerkenwell and St. Gyllis quite isolated from the main city, while Chelsey was quite in the wilds.

Even the great devastating fires did not destroy the line of the public highways. After that of 1666 Sir Christopher Wren wished to remodel the town and make it regular, symmetrical and convenient; but although he was the prevailing spirit in the rebuilding of London city, and no important building during forty years was erected without his judgment, his plan for regulating and straightening the streets did not take effect. Much of the picturesque quality of the city is owing to its irregularity and the remains of its past. Wren rebuilt no less than sixty churches, all showing great variety of design. St. Paul's, the third Christian church since early Saxon times on the same site, was his masterpiece. Although an adaptation of St. Peter's of Rome, it bears the impress of his versatile genius. His influence in architecture continued late into the eighteenth century.

Of his immediate predecessor, Inigo Jones, the Banqueting House in Whitehall, now used as a museum, remains; it is a fragment of the splendid palace designed by him for James I., to take the place of York House of Wolsey. The classical revival began with G. Gibbs; he built St. Martin-in-the-Fields, whose Greek portico, according to Augustus Hare, is "the only perfect example in London." The brothers Adam also flourished at this time, and introduced grace of line and much artistic skill in domestic decoration. Sir W. Chambers with Somerset House, and Sir John Soane with the Bank of England, continued the classical tradition, but it did not prevail in full force till Nash, "the apostle of plaster," planned Regent Street, from Carlton House to Regent's Park, and the terraces in that locality, all in the tawdry pseudo-classic stuccoed style, which was applied indiscriminately to churches, shops, railway stations, panoramas, etc., etc. It was not till the middle of the last century that the Gothic revival began to flourish. Pugin, Britton, and Sir John Barry then became prominent. The last-named built the Houses of Parliament, which elicited so many different opinions. Bodley and Norman Shaw have made the Queen Anne style, which now prevails, popular, and it is applied indiscriminately in a cheap form to every conceivable purpose. The demand for originality in street architecture is to be seen in the tall, important blocks of residential flats and new hotels now rising up in every quarter. They are the signs of the times, showing the process of transformation which is going on rapidly, sweeping away much that is beautiful to meet the requirements of modern life.

It is not in the architectural survey of London that Mrs. Cook is at her best, but in the many sides of London life she gives us with so much vivacity. She has a knowledge of the people which can be acquired only by those who have an extraordinary gift of sympathy which puts them in touch with all humanity. Whether it be of the Yiddish slave market in Whitechapel; the Italian colony of Eyre Street Hill, consisting of models, organ grinders, and ice-cream venders; the sailors' town east of the Tower—she writes as one who knows from her own experience. Mrs. Cook is especially fond of children, and gives us innumerable anecdotes of the sayings and doings of little Cockney waifs and strays in their own dialect.

The illustrations are numerous. Those of places, by Griggs, are often good. Mr. Thomson's character sketches are so exaggerated as to be almost caricatures.

People of the Whirlpool: From the Experience Book of a Commuter's Wife. The Macmillan Co.

'Twixt God and Mammon. By W. E. Tirebuck. D. Appleton & Co.

"People of the Whirlpool" is the literal translation of the Indian name given by their Long Island neighbors to the inhabitants of aboriginal New York, in reference to the seething waters of Hell Gate—a name singularly appropriate, on other grounds, to the New Yorkers of to-day. The book, written by our old friend Barbara of the 'Garden of a Commuter's Wife,' is fundamentally a protest against the ideals of life held by the very rich of our day, and the demoralizing influence which these have on all with whom they come in contact. A colony of the "Whirlpoolers," as she calls them, establish themselves on the bluffs near the house in which Barbara, now married and the mother of twin boys, has lived all her life, endangering with their false standards the happiness of the whole community. The same note is struck in the experience of two New York friends, an old bachelor and an old maid, people of means, of good family and connection, who find themselves gradually isolated by the different manner of life that has grown up about them. Barbara makes a plea for the obsolescent home, for simple domestic pleasures and true neighborliness; she deplores the lost art of sociability, the unrest of an age that stays in a place only long enough to plan the next move.

The atmosphere of the book is pleasant, even very pleasant; it is both interesting and amusing, while the underlying truth makes it profitable. As to this truth itself, the demoralizing effect of wealth on a community, there has never been a time in history when the writers of one generation have not condemned as demoralizing customs that are a matter of course to the next—a fact significant of more things than can be touched on here. The weakest point in 'People of the Whirlpool' is the mechanical pairing off of the characters in play fashion. An old couple, as well as a young couple, is sent in front of the footlights in a perfunctory way that cheapens the effect of the whole book.

"There is human nature, and there is Welsh nature," says Mr. George Meredith. We question whether the epigram expresses anything more than the conventional Anglo-Saxon attitude to the Celt in general; the Celtic temperament being a thing that the Anglo-Saxon equally admires and avoids. In ''Twixt God and Mammon' Mr.

Tirebuck gives a picture of Welsh farm life which does credit to his power of observation and his appreciation of certain aspects of the modern Gael and his aims. It was Mr. Tirebuck's ambition to become the novelist of Wales, but he was handicapped by an ineptitude for style, a lack of vocabulary, a lack of form surprising in a writer whose single and lifelong ambition was literature. Mr. Hall Caine's memoir of his dead friend is more interesting than the tale that it introduces; in fact, one could hardly read the tale through but for the curiosity as to Mr. Tirebuck that Mr. Caine inspires. Wales still awaits her novelist, but the figure of Josiah Probert, the unhappy young Welsh farmer with his Eisteddfod aspirations and his incomplete poetic gift, is striking and pathetic. He, however, is not the hero, and the main theme of the book is the conscientious scruples and the final lapse into worldliness of the Rev. Gomer Dean, a sort of Theron Ware, whose damnation comes of conforming to the conventional. Count Tolstoy is reported to have said that certain passages in Mr. Tirebuck's earlier novel, 'Miss Grace of All Souls,' are the best that has been achieved in modern fiction. As a critic, Count Tolstoy is, of course, completely disqualified, and one can see that what attracted him in Mr. Tirebuck's work was the incessant moral conflict, the balancing of the things of this world against the things of the soul, that may result in the "Resurrection" of a libertine or the degeneration of an ascetic. Mr. Tirebuck's contributions to this sort of literature are deficient in everything that insures immortality, since they lack the only antiseptic, style. Of the present work it is but fair to add that its final revision was interrupted by the author's death.

Sophocles: Translated and explained by J. Swinnerton Phillimore, M.A. (The Athenian Drama Series. Vol. II.) Longmans, Green & Co. 1902.

Professor Phillimore is the successor in the chair of Greek at Glasgow of Mr. Gilbert Murray, the translator of Euripides, and he employs in this translation of Sophocles the metre which in Mr. Murray's hands seemed well chosen because it was excellently wielded. When Dryden

"Grew weary of his long-loved Mistress Rhyme,"

and abandoned the rhymed couplet, he wrote some verses on the impropriety of such fetters for the fierce passions of tragedy; but lest he should some day be tempted to revert to rhyme, he added a saving clause in prose, to the effect that success with the rhymed couplet was not impossible, though for the time beyond his powers. Rostand has proved that the French Alexandrine can be made supple and flowing and expressive by a masterhand. Our five-foot rhymed couplet is the best English equivalent. The writer who ventures to express tragic emotion in the favorite metre of Pope must of course avoid magniloquence and smooth monotony. But there are worse extremes. Sophocles was neither jerky nor colloquial, while Mr. Phillimore is both. We trace his failure, which is signal, partly to the fact that he is no poet, partly to the determination of the Glasgow School to be at their ease with the classics; they are bent on bringing the modern reader in touch with the Greek writer, even at the cost of pulling the Greek down from his pedestal. So it is that the Professor of Greek in the University of Glasgow makes Œdipus, that immortal pattern of a tragic hero, address Antigone with the query:

"Say can you teach me what's the place we're at?"

To whom Antigone:

"He's gone; so, father, you may now speak out
In peace, for none but I alone's about."

The dread Eumenides are apostrophized as "Ladies," and Antigone, in her marvellous dirge, sings of "blubberèd eyelids," which is well enough in Spenser, but in the present context gives a false effect of quaintness.

For the most part Mr. Phillimore errs on the side of plainness, not to say uncouthness, of diction, so that such phrases as "matrimonial resort" (p. 48) or "Ballad-monger Bitch" (the Sphinx) are not alien to his style. But there are passages for the meaning of which one turns to the Greek text precisely as though one were reading Browning's version of the "Agamemnon":

"*Cho.* Mercy on us, Zeus! What may the man be?
Œd. Mine is not all that a destiny can be,
Meet for a blessing, Lords of the regions.
Proof of it—how by these alien eyes
Had I walked otherwise—
Sheer-hulk on a tiny allegiance?"

On page 67 Œdipus tells Antigone that

"In learning is
The circumspection of activities."

Yet nothing could be clearer than the original. Antigone's simple appeal to the Chorus (p. 72) is rendered:

"Merciful-spirited sirs, here dwelling,
Tho' you could not abide to behold
Father—his blindness; because Fame told
Those unpurposèd acts he fell in,
Still, we beseech you adoringly, ear to my misery, mine—
Ear incline,—
Suppliant here in my wrecked sire's cause to you—
Cause that I plead with you, eye to eye gaze at you,—
Eyes not of blindness mine—e'en as if I were a
Vision of kindred aris'n to you—O let his
Woes find mercy!"

This is neither sense nor poetry. Mr. Phillimore, in a note, refers to this monody as a *libretto*, and certainly in his version it reminds one of those monuments of sheer imbecility, the translated *libretti* of the Wagnerian operas.

A phrase which literally translated means "most insatiate of all men," is rendered "the arch-arch-unappeasable." Yet we are told in Mr. Phillimore's 'Introduction' that Sophocles is "never prosaic," that his odes were "rich with poetry," that he satisfies all Burke's requirements of smoothness, evenness, and beauty, and never "clothes his thoughts in reach-me-downs"—a vulgar trade term for ready-made clothing, the use of which illustrates the "levelling-down" method of the translator. "Woe to them that are at ease in Zion!" And woe to the English reader who must take Mr. Phillimore's word for it that Sophocles does exhibit all these and other perfections, yet can never catch a glimpse of them in this version.

We have not the space for further quotation, and since other and better translations of these three plays are to be had, it would not be worth while to dwell on the defects of this, were it not that Mr. Phillimore represents a tendency in modern scholarship; is himself a good scholar, speaking with authority from the chair of a great university which has long been associated with some of the best classical scholarship in Great Britain; and contributes this volume to a series which aims at nothing less than a standard English version of the poets of the Athenian drama. *Corruptio optimi pessima.* The better the scholar, the more reluctant he should be to assume the poet and set himself the poet's task. What *does* the intelligent "English reader" think of the poetry of the Greeks? He has the right to ignore it, as he usually does, silently; to reject the tradition of its charm until he is confronted with English versions that for sheer beauty and power cannot be respectfully neglected. It still rests with the poets to produce such versions; yet those of them who are Grecians seldom venture on more than a paraphrase. Mr. Lang, who is almost a poet, would not dream of harboring the ambitions that resulted in Mr. Phillimore's 'Sophocles.' Shelley, Matthew Arnold, Tennyson, and Swinburne borrowed for the most part to paraphrase, and have not repaid their borrowings with a translation of the original whole. A good instance is a sonnet of Wordsworth's which no English reader, we should suppose, can fail to appreciate:

"Still glides the stream, and shall for ever glide;
The form remains, the function never dies;
While we, the brave, the mighty, and the wise,
We men who in our morn of youth defied
The elements, must vanish."

The central thought here, the line that thrills, is taken from the dirge of Moschus: "Ah me, when the mallows wither in the garden, the green parsley, the curled tendrils of the anise, on a later day they live again, and spring in another year; but we men, we the great, the mighty, the wise, when once we have died, in hollow earth we sleep, gone down into silence; a right long and endless and unawakening sleep."

When all is said and done, it still remains for the English reader to learn to read Greek; for without that ability he can never fully appreciate the best in English poetry, or at any rate his appreciation will lose the charm on which Aristotle laid stress—the charm of recognition.

Love Letters of Margaret Fuller, 1845-6. With an introduction by Julia Ward Howe. Appletons.

It is hardly to be expected that any publisher should abstain from adding the alluring name of Love Letters to what their discreeter editor describes only and more accurately as "letters inspired by a very fervent friendship." The person to whom they were written is no longer living; he omitted in editing them, by his own statement (p. 5), such passages or entire letters as he saw fit; and he caused them to be privately printed in Europe and sent out to this country, several years ago, with an unsuccessful effort after publication. They are now finally reprinted, and in a judicious form and manner, with an excellent preface by Mrs. Julia Ward Howe, and some good supplements or mitigating influences, as one might say, in brief contemporary essays by Emerson, Greeley, and Congdon.

The existence of these letters was known in a general way to the various preceding biographers of Margaret Fuller Ossoli; but they were set aside as having little real value either as to certain authenticity or personal

interest. There also existed the tradition that there was in the background some diseased influence, not now clearly traceable, and exerted not over Miss Fuller, but over Mrs. Horace Greeley, then the victim of nervous disorders not easily to be disentangled. She was watched over with the most careful interest by Margaret Fuller, and we have glimpses of the invalid's condition in this respect only in a few letters here and there (pp. 103, 126, 128, etc.). What farther light might be thrown on the matter if the German friend had seen fit to publish all the letters, we can now only conjecture, and it is fortunately not worth conjecturing. As to Margaret Fuller's own relation with Mr. James Gotendorff (*né* Nathan) we only discover that her expressions of personal interest ranged at the time from the apparent ardor of the German "Liebster" (p. 87) to the more guarded and more habitual "chosen sister" (pp. 108, 130, 145). As for the gentleman himself, his sentimentalism outlived its object, and here closes its expression with such a flight as this: "The mutually much-longed-for meeting is yet to be somewhere! somehow!" This was written apparently in 1873 (p. 6). How much this was reciprocated meanwhile by the lady herself may be judged by her dismissal of him, a quarter of a century earlier, in 1846, after receiving his last letter in Edinburgh; the record being still visible, in her handwriting, in her MS. diary preserved in the Cambridge Public Library, to this effect, under date of Sept. 6: "I understand more and more the character of *the tribes*. I shall write a sketch of it and turn the whole to account in a literary way, since the affections and ideal hopes are so unproductive" (p. 187). It is pretty certain that this diary was never seen by Mr. Nathan; but if it had been, he might have been confirmed in the purpose of "turning the whole to account in a literary way" in his own behalf, through this volume. Interest is at any rate given to the reprint by the revived study of the "Transcendental" period in this Emersonian year.

Variation in Animals and Plants. By H. M. Vernon, M.A., M.D., Fellow of Magdalen College, Oxford. Henry Holt & Co. 1903.

At the present time, activity in biological research is chiefly centred upon the study of variation. Almost every investigation bears directly or indirectly on this subject, and almost everything is made tributary to it. Within the last few years a considerable number of the investigators in this field have adopted certain suggestions in regard to graphic representation which were made a good while ago, and they now endeavor to express in precise mathematical terms the results which they obtain. Obviously there are many ways in which the results can be exactly or approximately expressed, and therefore there has been considerable diversity in the methods adopted. Dr. Vernon, in the small treatise here mentioned, has brought together most of the widely used methods, and has accompanied the description of them by illustrative examples. Even if he had done merely this, he would have rendered a good service to science, since he here places in a form convenient for comparison the rival schemes of mathematical expression.

At first, it seems strange to have a naturalist deliberately set about the task of counting the sepals and petals of a thousand buttercups or the florets of as many daisies. It seems hardly more dignified as a scientific pursuit than the counting by a maiden of the florets she tears from a daisy, to determine her exact relation to another person. But when the results are properly tabulated by the naturalist, and the curve deduced therefrom, certain interesting aspects are presented which do not appear when the variations in number are expressed in vague terms. These mathematical expressions afford means both of analysis and of comparison, so that by their right employment the whole range of correlated variations becomes much extended. Moreover, such expressions place in the hand of the investigator a safe means of indicating the results of experiments. The relations of environment to variation are also more clearly expressed by such formulæ and curves. Dr. Vernon adds to the value of his book by dwelling upon these subjects and indicating the results which have lately been obtained. In some instances these results are most unexpected.

Naturally, the more impulsive investigators have seized upon these mathematical expressions as convenient and exact graphic representations of the limits of species at any one age and place. It is likely that a good deal of this fascinating work will not bear the test of time, but it is nevertheless stimulating in a high degree. The whole treatise by Dr. Vernon is readable and well-proportioned. In a few instances there is some confusion of terms, but not enough to embarrass even the general reader. The authorities are cited with commendable fulness, and due credit is given to the pioneers in this field. Best of all, the treatise is enriched by a good table of contents and by a subject-index remarkably complete. We can heartily commend the work to all who are interested in the new methods of investigating the subject of variation in plants and animals and in recording their results. That some of these new methods have come to stay, no one can doubt who sees the interesting manner in which the journal *Biometrika*, devoted to their interests, is being conducted.

Lectures on the History of the Nineteenth Century. Edited by F. A. Kirkpatrick. Macmillan.

These lectures were delivered at the Cambridge University Extension Summer Meeting in August, 1902. "The central design of this series," says the editor, "was the treatment of recent developments in the principal countries of Europe by natives of those countries, in order that the most intimate and essential points of view might be presented." Thus Prof. Erich Marcks of Heidelberg spoke on "The Transformation of Germany by Prussia," "Bismarck," and "Austria-Hungary"; Prof. Paul Mantoux of the University of Paris spoke on "France as the Land of the Revolution" and "Two Statesmen of the Third Republic"; and Prof. Paul Vinogradoff, late of the University of Moscow, spoke on "The Reforming Work of the Tsar Alexander II." and "The Meaning of Present Russian Development." We have named in the above list all the foreigners who contributed to this series of seventeen lectures. Despite Mr. Kirkpatrick's statement that the main motive is furnished by the contributions of the Continental lecturers, the table of contents shows us the names of nine Englishmen in addition to the three Europeans already mentioned. Most of these are Cambridge men, although Mr. Bolton King, who deals with "Italian Unity" and "Mazzini," is a member of Balliol College, Oxford. It may interest those who give summer courses of lectures at our own universities to see how the lectures given in summer courses at Cambridge compare as to form and substance with their own. One can hardly imagine, however, that all the lectures delivered before extension students at Cambridge are prepared so elaborately as the essays contained in the present volume.

Of the three Europeans in question, Professor Vinogradoff is the most widely known to English readers on account of his important writings on Villainage and Folkland. His criticism of the Russian bureaucracy is very severe, and he holds the system to be doomed even more by the confessions of present ministers than by the accusations of their adversaries. His main conclusion is as follows: "The common rights of civilized man, which have come to be a self-understood element of European life, cannot be longer denied to the Russians, and it is only to be hoped that the Government in power will not protract much longer its blind resistance to progress." There is also a striking vindication of French political ideals by Professor Mantoux, whose point of view is very different from that of Mr. Bodley. Quoting from 'Aurora Leigh,' M. Mantoux discovers in France

> "A poet of the nations, who dreams on
> Forever after some ideal good . . .
> Some wealth that leaves none poor and finds none tired,
> Some freedom of the many that respects
> The wisdom of the few. Heroic dreams!"

"As long," concludes M. Mantoux, "as such dreams are dreamt in France, as her inhabitants are never content with dreaming only, she will remain, as she has been for more than a hundred years, the land of the Revolution." Among the other papers here published, those which have attracted our attention most are the general introduction by Dr. A. W. Ward, and "England and the United States," by Dr. J. T. Lawrence.

We need hardly point out that the book as it stands is a collection of short essays on salient topics, rather than a continuous narrative. It will make a useful supplement to text books like Fyffe, Andrews, and Seignobos. Some of the essays are strikingly good, and none of them are poor.

Studies in the Cartesian Philosophy. By Norman Smith. The Macmillan Co. 1902. 12mo, pp. 276.

No matter how fresh one may come from the perusal of the works of Descartes himself, of the history of Bouillier, and of some of the swarm of more recent explicators of his metaphysics, one will find much to learn from the pages of this little book. It is composed in the manner which seems at this time to be most approved—that of arranging the topics, not according to the conceptions of the philosopher to be expounded, but according to those of the expositor, and of setting down under each head whatever the four winds of heaven

can blow together from all the quarters of the subject's *Opera omnia*. In this way one can make an interesting cento; but whether it will represent any stage of development of the thought of the philosopher to be expounded, will be a question to be answered separately in each case. Critics who use this method are apt to forget that the thought of the most stupid and wooden of metaphysicians will undergo considerable development in the course of years, and that this is far more true of any philosopher who is likely to impress men as great. Still, there is no method of composing a work of this kind (or, for that matter, of any other) which can absolve the reader from the necessity of critical thought in getting the juice of it; and the very circumstance that a philosopher will take different views of any difficult matter at different stages of his development renders their juxtaposition instructive in regard to the abiding characteristics of his thinking. Nobody would go to a concordance to gain one's first acquaintance with a philosopher any more than with a poet; and Mr. Smith expressly says in his preface that "this volume is not designed to be an introduction to the study of Descartes." But a work of a nature somewhat approaching that of a concordance is of extreme utility as an aid in forming one's matured conception of whatever philosopher it may concern.

We must not, however, convey the impression that Mr. Smith makes it his business to compare all of Descartes's different statements upon any point. He does not write as a biographer nor even as a historian of philosophy. He does not treat the utterances of Descartes as historical curiosities, but rather argues as to their truth or falsity much as if he were examining a contemporary writing on philosophy. His whole exposition is so permeated with his own argumentations that one could not always gather from reading it exactly how much of it is actually in Descartes, and how much Mr. Smith thinks would be fairly attributable to Descartes considered as if he had written in the twentieth century. There is much in the book concerning which it is difficult to form a definite judgment in the absence of a full explanation of Mr. Smith's own philosophy; and no such explanation is vouchsafed. One may say, however, in general, that Mr. Smith finds fault with Descartes for not being nominalistic enough.

Mr. Smith is of opinion that the really important part of the system of Descartes is his philosophy of the sciences, and that this has but a very artificial connection with his metaphysics. Yet he confines his interpretation entirely to the metaphysics and to the writings on method in their relation to the metaphysics. He certainly succeeds in making the Cartesian metaphysics appear more crude and grossly monstrous than ever, whether its principal fault be that which he attributes to it, or whether it be not quite in the contrary sense that it sins. In either event, Mr. Smith's conspectus of the Cartesian metaphysics is profitable reading. Leaving that, he passes on to some decidedly interesting chapters on the Cartesian elements of the philosophies of Spinoza, of Leibniz, and of Locke; and these are followed by an approving account of Hume's attack upon Cartesian rationalism and spiritualism; the volume closing with a chapter on Kant, whom Mr. Smith seems to value as a positivist and an agnostic.

Rome and Reform. By T. L. Kington Oliphant of Balliol College. The Macmillan Co.

It is now many years since Mr. Kington Oliphant published his life of the Emperor Frederick II. He returns to the field of history with an extensive work entitled as above, which seems to embody in its two volumes the reading and the reflections of a lifetime. It is so detailed in its statements and so controversial in its tone that it might well elicit a long article, were the demands upon our space less exacting than they are at the present moment. As we all know, the world contains a multitude of people who most truly believe that the Church of Rome, if not the Scarlet Lady, is a deadly foe to freedom of thought and to the highest development of human character. Each of these would gladly level his shaft at the Papacy if he could hope that his efforts would be attended by any result. But Rome, having survived the attacks of Luther, Calvin, Voltaire, and the critics of the nineteenth century, seems in a sense invulnerable. Where so many lines of argument present themselves, which shall be chosen? Where so many stalwart opponents have failed, who can feel confident that his word will carry the least weight?

Undeterred, however, by such considerations, Mr. Oliphant winds his horn at the portal of the Vatican, and offers himself as a champion to vindicate the cause of the Protestant North against the Catholic South. Dividing the history of Western Europe into seven epochs, he says, when he reaches the sixteenth century:

"The age of Debasement was about to begin; Southern Europe was by slow degrees to sink far below the level of the hitherto despised North. Each State, soon after 1517, heard the kindly bidding, 'Friend, come up higher'; some obeyed, others went their own way, and after a short interval were dragged down by Rome. We shall soon see Holland rise above Spain, England above France, Sweden above Poland, Prussia above Austria. The age of Debasement was to bring calamities far worse than those known to the age of Roman Dominion; the war against the Albigenses caused much less misery than the Thirty Years' War; Bohemia had to bear much suffering after 1420, but she was never crushed altogether till 1620."

Mr. Oliphant's design, then, is to trace the history of Western Europe since the Reformation, country by country, and to demonstrate by historical proof the fact of decadence on the one hand, of progress on the other. "By their fruits ye shall know them" is his touchstone. Those who sympathize with his general attitude will cry "Bravo!" as they see him muster a host of passages against the Court of Rome. Those who differ from him will shrug their shoulders and say, "Post hoc, ergo propter hoc." In some respects Mr. Oliphant reminds one of Buckle. His use of authorities is similar, the width of his reading is illustrated on every page, and yet he is not quite so convincing as he obviously expects to be. He would persuade more if he inveighed less.

While offering this general criticism, we must be careful not to accuse Mr. Oliphant of the narrowness which is often apparent among the opponents of Rome. He attacks the Ultramontanes violently, but avows a fondness for moderate Catholics, setting Deák high above Guizot in point both of practical politics and of morality. In the Preface he says: "It is impossible to please all, and I have little liking for the applause of mere fanatics, by whatever name they may call themselves. But if I win the praise of Protestants of the school of Hallam, of Catholics of the school of De Tocqueville, I shall not have written in vain." This is a worthy aspiration, but Mr. Oliphant, despite his erudition and a manifest desire to avoid the pitfalls of prejudice, hardly realizes it.

Representative English Comedies. Edited by Charles Mills Gayley, Professor of the English Language and Literature in the University of California [and by other scholars]. With Introductory Essays, etc. The Macmillan Co. 1903.

The national and popular drama of a people is the attempt of that people to see itself. In tragedy and the romantic drama it sees itself as it would like to be—in other words, its ideals; in comedy it tries to see itself as it really is. Hence to the student of social development, as well as to the student of literature, the history and development of national and indigenous comedy are of great importance. For such a comedy is not merely made for a people: it grows out of the people as leaves grow from a stem; and it is this process of growth, from the simple seed-leaves to the consummate flower, that is traced in the volume before us.

The Christian church destroyed the corrupt remains of the old Roman drama; but out of the bosom of the church the new drama arose. Beginning with dramatic presentations of incidents in the life of Christ, or of some saint, it culminated in those stupendous mystery-cycles whose antique form now somewhat hides their real grandeur, whose scene was the whole world, whose time was the interval between eternities, whose subject was the contest of God and Satan for the possession of mankind, whose scope reached from the Creation to the Judgment Day. These and the "moralities," in which God and Satan are withdrawn and man himself is the protagonist, were popular dramas in every sense of the word, being not only for the people, but of the people; and in them may be found every genus of dramatic motive, from the most awful or affecting tragedy to the wildest farce. From these, as Professor Gayley clearly shows in his "Historical View," and not from academic imitations of Plautus or Seneca, nor yet from the Latin dramas of the Middle Ages, grew the English national drama; though these latter had considerable influence upon the playwrights, especially in matters of form.

The elements of comedy, and even of realistic and local comedy, already existed in the miracle plays; and in the moralities, as was unavoidable, these were still further developed, until, as the allegory became less obtrusive and the realism stronger, there was scarce any difference between these and true comedy. The steps of the transition are excellently traced in the essay mentioned above, which is, indeed, a thorough study of the subject "from the beginnings to Shakspere."

The representative comedies selected—to each of which is prefixed a critical essay

by some well-known scholar—satisfactorily cover the ground. The two plays from Heywood show the crude beginnings; Udall's "Roister Doister" is a scholar's attempt to construct an English play on a Plautine model; Stevenson's (?) "Gammer Gurton" is a hilarious rustic farce; the plays from Lyly, Peele, and Greene exemplify romantic comedy with the lyric feeling, and Porter's "Two Angry Women" gives us the bourgeois comedy of real life. The next step will take us to Shakspere, Jonson, and Fletcher.

Modern School Buildings. By Felix Clay. London: Batsford; New York: Scribner. Pp. xix., 459. 400 illustrations.

A year or more ago we reviewed an excellent book on School Architecture, by Mr. Edmund Wheelwright, in which the school planning of European nations was passed under review, but in which attention was given chiefly to the schools of America. A somewhat similar system is adopted by Mr. Felix Clay, who, being an Englishman, gives the place of honor to the schools of his own country. Indeed, its title would more exactly express the contents of the book if it read 'Modern *English* School Buildings,' since the brief notices of German and American schools contained in it are scarcely more than side-lights on the main subject.

Mr. E. R. Robson pointed out in his 'School Architecture' so long ago as 1878 that "the plan of a building depends so much upon the method of tuition that our acquaintance with the latter is of the first necessity to a school architect." Feeling the truth of this, Mr. Clay devotes more space to the educational system of England than might at first seem necessary in a book which purports to deal chiefly with buildings. Although much has been done within the last twenty or thirty years to unify elementary education in England and to provide an efficient system, secondary education is still most varied and confused. Mr. Clay's chapter on this subject brings as much order as may be out of the tangle, and helps the reader to a perception of the peculiar conditions that have given rise to a vast network of schools of an extraordinarily diverse character, varying from each other by such imperceptible gradations as defy classification, yet extending from the little Private Adventure School on the one hand to great Public Schools such as Eton, Harrow, and Winchester, on the other.

This introductory essay leads to a consideration of buildings devoted to secondary education, occupying more than half of the book, and including not only a careful analysis of the component parts of schools, such as class-rooms, playgrounds, stairways, etc., but an examination of the various kinds of secondary schools, such as boys', girls', day, boarding, special, etc. From the great number of interesting plans presented in the book, including such fine examples of school designing as the Roedean School for girls overlooking the sea at Brighton, and the splendid new Christ's Hospital (the Bluecoat School) at Horsham, it is easy to see that the characteristic of the English plan which most clearly distinguishes it from the American or German is the assembly hall. In Germany this hall, though regarded as of prime importance, is generally placed at the top of the building, in a quiet spot, where it may serve among other uses that of an examination hall. In America it is sometimes absent, or, if included in the plan, it too often is found only as the result of a scheme which brings it into being by pushing aside movable partitions, thus throwing together a number of class rooms. In England there are, roughly speaking, two types of plan in large secondary day schools: first, that with a central hall into which the class rooms open directly; second, that with class rooms from which one must pass through a corridor to reach the hall. The first method is rapidly growing in favor. It is obviously economical of both space and time. Supervision is simplified, since during all movements from room to room or from room to hall the classes are observable from one point. Even very large schools may be thus arranged, as in the case of the Bedford Grammar School, where there are over 800 students, thirty class rooms opening into the hall and its galleries. Such halls serve sundry purposes, as for prayers, lectures, prize-givings, as playgrounds in wet weather, as drill rooms, etc., though obviously they are not very satisfactory for all.

The latter half of the book is devoted to elementary education, a subject of no greater complexity in England than in America, and to school hygiene, plumbing, heating and ventilation. In all ways the treatise covers the subject of modern English school buildings most satisfactorily. The typographic excellence is marked. The plans are clear and legible. There is a good bibliography.

English Literature: An Illustrated Record. By Richard Garnett, C.B., LL.D., and Edmund Gosse, M.A., LL.D. In four volumes: Volumes I., III. The Macmillan Co. 1903.

A complete and satisfying record of English literature must contain biographical sketches of authors, adequate mention of their works, critical appreciations, representative extracts, and at least a thread of concurrent political and social history. To combine even a minimum of these requirements in a volume of moderate size is a difficult task; to provide them copiously and at the same time enrich the text with a lavish display of pictorial illustrations is possible only in a large and costly work such as Doctors Garnett and Gosse have given the public. Of this work, volume i., "From the Beginnings to the Age of Henry VIII.," and volume iii., "From Milton to Johnson," are before us. Publishers and authors have done their best to make this an attractive and indeed sumptuous work. Even putting the text aside, the abundance and excellence of the illustrations, including facsimiles of MSS., autographs, engravings and title-pages, portraits, views of places, buildings, etc., on a scale never before attempted in a work of this kind in English, we believe, give it a quite peculiar value, and that not to the eye alone. We not only enjoy a writer more, but we understand him better, when we have seen his portrait, his handwriting, and his home or favorite haunts. Dr. Gosse, in treating the period from Milton to Johnson, has occupied a field in which he is specially at home; and the copious details given in his vivacious and pleasing style bring the literary world of the seventeenth and eighteenth centuries vividly before us.

We might, doubtless, in so extensive a field find something here and there to carp at: for instance, to claim an extent of fifteen centuries for English literature seems to our mind to savor of what Parson Bull calls "the sin of exorbitancy," while to place 'Widsith,' even hesitatingly, in the sixth century because of the mention of Hermanric, is much like assuming that the Iliad was written in the days of Agamemnon. To tell us that "anapæsts" came into English verse at the Restoration; that the poem 'Tristrem' is in the Northumbrian dialect; to speak of Queen Margaret of Scotland—the lineal descendant of Cerdic, and the ancestress through whom the present King of England traces his lineage to Alfred the Great—as "a princess of Hungary," but "half-Saxon also"—these are things that would set a captious critic's teeth on edge; yet they are trifles compared with so much correct information, sensible criticism, and clear and agreeable narration, presented in so rich and attractive a dress; and to the public for whom this work is especially intended, they matter not at all.

Sir A. Henry Layard, G.C.B., D.C.L.: Autobiography and Letters from his Childhood until his Appointment as H. M. Ambassador at Madrid. Edited by the Hon. William N. Bruce, with a chapter on his parliamentary career by the Rt. Hon. Sir Arthur Otway. Charles Scribner's Sons. 1903. 2 vols., pp. xii., 354, xii., 306. Portrait, illustrations, maps.

It is a curious fact that Orientalists, whether of the desk or the saddle, are never Orientalists simply. This may be because they seldom begin the preparation for their lifework until an age when they have already acquired other and abiding attachments and interests. It may also be because the student of an absolutely alien yet living civilization must first and thoroughly know that into which he has been born. But when the fever of the East is in the blood, sooner or later it claims its own. Then those other sides of the intellectual life fall into the background, though still remaining to broaden and strengthen, and perhaps toward the close to become again dominant. All which is very strikingly illustrated in the present autobiography, a charming record of certain parts of a career always many-sided, full-blooded, whole-hearted. What are practically other sections of this autobiography have already appeared in 'Nineveh and its Remains' and 'Early Adventures.' For Layard's parliamentary episode and his final study of Italian art he left no developed material—he may have recognized and rightly that these, and especially the first, had been side issues; for the publication of his account of his embassies at Madrid and Constantinople the time has not yet come. This evidently was a many-colored life; and a many-colored childhood and youth led to it. With a parentage which reminds of 'Denis Duval,' his early life was cast in Florence and London. Florence in the twenties was the Florence of Landor; of Seymour Kirkup, the discoverer of the fresco portrait of Dante; and of Trelawny, the "Younger Son." And so under these influences young Layard began to be a dem-

ocrat and radical, to study Italian art—as a child he slept under a picture of Fra Lippo Lippi, now in the National Gallery, and still bearing a wound from the heel of his shoe—and to be drawn to the wanderer's life and to the East. Here, too, as always, the 'Arabian Nights' had its part; outside of Germany there is hardly an Orientalist but dates his new birth from it. Later, in London, he was in the circle of "Disraeli the younger," shown here partly in shirt sleeves and boxing gloves, partly as needing rescue from a sponging house, and partly as an extremely puppyish author; of Ward of the forgotten 'Tremaine'; of Samuel Warren, Theodore Hook, and Crabb Robinson. Of the last it is curious to remember, in this day of Assyriology, in which æsthetics play little part, that for him the Nineveh antiquities were simply specimens in the history of art. And the attitude of even the Institute of France when Layard addressed it in 1847 seems to have been only somewhat broader.

The life and achievements which followed these beginnings are known. Sir Henry Layard has left his name on the story of adventure and exploration in the East, on Assyriology in its earlier stages, on diplomacy in Constantinople and elsewhere from and through the most brilliant period of Sir Stratford Canning to the Russo-Turkish war of 1878, on the Arundel Society, the National Gallery, and the history of art in his rewriting of Eastlake's 'Handbook,' and on the decaying art industries of Venice. He saw the Crimea during the war, India during the mutiny, and Italy in the war of liberation. In the present volume perhaps the most picturesque and prominent passages are those which describe Baghdad in 1840, and the great Elchi as he lived and stormed at Constantinople. The portrait of the latter commends itself especially for evident truth; "the voice of England in the East" is seen to have been a noble and upright but passionate and imperious one, which sometimes worked to its own harm. There is also testimony of great interest to the value of the educational work done by the different American missions in the East. This influence was not only direct, but also indirect, by stirring up the Oriental churches to similar renewal of life. From Robert College, too, went most of the leaders of the Bulgarians and other Balkan races to their struggle for independence.

If the proof of these volumes had been read by an Orientalist, it would have been greatly to their advantage.

BOOKS OF THE WEEK.

Annual of the British School at Athens. No. VIII. Session 1901-1902. Macmillan. 17s. net.
Bacon, Edwin M. Boston: A Guide Book. Boston: Ginn & Co.

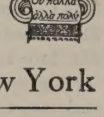
To be published this week.

Cheerful Americans

By Charles Battell Loomis. With 24 illustrations by Florence Scovel Shinn, Fanny Y. Corey, etc. 12mo, $1.25.

A collection of short, snappy stories with highly humorous pictures.

A Duke and His Double



By Edward S. Van Zile. With a frontispiece by Florence Scovel Shinn. 16mo, 75 cents.

An amusing tale of current New York life. It has most of the qualities of a good farce on the stage.

Henry Holt & Co., New York

JUST READY

Mors et Victoria

A Drama in Three Acts

Octavo, cloth extra. Printed at the Merrymount Press. pp. 120, $1.20 *net*. By mail, $1.28.

ALLEN'S FOOT-EASE
For Hot, Tired, Aching, Swollen Feet.

Allen's Foot-Ease, a powder. It's the greatest comfort discovery of the age. Makes tight or new shoes easy. The distinguished English medical authority, the **London Lancet**, says: Analysis discloses in Allen's Foot-Ease ingredients suitable for treating the feet. The powder is well adapted for the purpose intended, since it is fine and impalpable, with a slippery, velvety feeling to the touch. It, moreover, contains an antiseptic. We have received a list of testimonials in favour of this powder.—It is a certain cure for sweating, callous and hot, tired, aching feet. Try it *to-day*. Sold by all Druggists and Shoe stores, 25c. Trial package FREE. Address Allen S. Olmsted, Le Roy, N. Y.

The Nation.

NEW YORK, THURSDAY, JULY 23, 1903.

The Week.

That the President desires further financial legislation, and that he will urge it upon Congress in the extra session of November, is important news; but it would be more important if he or any other in authority would tell us exactly what legislation is contemplated. To whip through a hurried and harmful bill in November would, no doubt, fall in well with the plans of certain people, but it would be a poor way to advance currency reform. The country is entitled to a deliberate study of any comprehensive bill proposed. Hysterical action, urged in an assumed crisis, is the last thing the situation calls for. If November brings any such scheme as has been attributed to Senator Aldrich, of utilizing the demand for a more flexible currency to create a new market for sluggish securities, it should at once be put over to December and March and the Greek Kalends. Even a measure looking solely to an enlarged emergency circulation of banknotes requires pains and time to frame and pass. The apparent difficulty is that the Congressional leaders do not agree. Senator Aldrich's committee has been incubating so long in vain that it begins to look as if it had been sitting on nothing but china eggs, with possibly a fragment or two of a gold brick. Reform of our currency is undoubtedly needed, but it should be real reform, forward and not backward.

General Wood's promotion by the President to be major-general will have a very bad effect upon the discipline of the army. The question is not so much of the means by which General Wood attained his present rank, as of his military fitness for the higher one to which he is now designated. When President McKinley made him a brigadier, the army felt that it was a case of favoritism. His promotion to be major-general by Roosevelt will be considered by the best men in the army as a slight put upon demonstrated military capacity. In the course of a few years, unless the President of the time has the courage to pass him by, Gen. Wood—an army surgeon—will become the head of the army. With him will be associated, as senior major-generals, those heroes of many a hard-fought interview, Fred Grant and Funston.

The President's selection of thirty-four veteran colonels of the army for retirement as brigadier-generals is accompanied by the announcement that it will end this method of rewarding the civil-war veterans, except in cases of "special importance." The process of making new generals for a day and then retiring them had gone on pretty steadily under President Roosevelt, as it did under Mr. McKinley. Whereas there were but forty-two retired generals on January 1, 1898, there are now, with Friday's selections, one hundred and fifty-one of different grades—a plain demonstration of one way by which our pension bills have been swollen owing to the war with Spain. It must be stated, however, that the welfare of the army demanded its rejuvenation, and, as Congress did not object, this was the fairest way to remove the old men who were physically and professionally no longer up to their work. Both the President and Secretary Root were careful to obtain the consent of the Senate Military Committee before beginning these wholesale retirements. It is needless to say that Congress never intended that one vacancy in the brigadier-generals should serve to give thirty or forty men that rank for a day. An unscrupulous President might thus place several hundred capable officers on the retired list without their consent. Now both Congress and President Roosevelt realize that this cannot go on indefinitely. Friday's selections comprise mainly meritorious officers. But there are dozens like them, and some far more worthy who have retired since 1898 with the rank of colonel. Hence there will inevitably be much jealousy and heart-burning.

President Roosevelt has ordered the reinstatement of an employee of the Government Printing-Office who had been discharged because he had not lived up to his alleged obligations to a labor union. It would have been easy for a Presidential candidate for reëlection to dodge the issue, and at the same time to find another place for the injured employee. What has happened is another deserved check to the arrogance of the labor unions. The President reminds them that no rules and regulations of a union "can be permitted to override the laws of the United States." The offence of the employee who was discharged was simply that of giving information to a member of Congress as to means of saving money by changes in the office of the Public Printer. As those changes involved a reduction of the laboring force, there was an outcry from the union. Dismissal was quite too mild a punishment for an assistant foreman who was so unpatriotic as to wish to save a few thousands for Uncle Sam. Hanging is too good for a union workman who fails to realize the true motto of our up-to-date unions—"to make work, not to do it."

Commissioner Ware has hitherto shown a scrupulous regard for the civil-service laws during his administration of the Pension Bureau, and we regret to notice signs of carelessness, or of a changed spirit. Last week there came to light the forced resignation of an examining surgeon to whose efficiency Mr. Ware certified, because of an oral executive order that, whenever practicable, an examining board shall be composed of two Republicans and one Democrat. It seemed "practicable" and proper to Mr. Ware to remove this faithful surgeon because he was a Democrat. The Washington *Post* has now brought to light another indiscretion. A few days ago, it seems, Mr. Ware wrote to a newly appointed examiner who was getting a salary of $2,000 plus a pension for disability, ordering him to "swap" places with another veteran who had no pension in addition to his salary. The new appointee has thus been forced to content himself with less salary and an inferior position. According to the *Post*, Mr. Ware wrote that he desired to give the older employee some of the "chicken pie." If he actually used this language, Mr. Ware has coined a phrase that will recoil upon him like Postmaster-General Payne's "hot air."

We have been several times assured from Washington that the bottom has been reached in the probing of the postal scandals, but the indictment of George W. Beavers by the Federal grand jury in Brooklyn does not bear out this assertion. Beavers was chief of the Salaries and Allowances Division of the Post-Office Department. He resigned suddenly last spring, and his name has frequently been mentioned in connection with the promotion syndicate which is said to have operated in the New York, Brooklyn, and other offices. Beavers is also said to have had something to do with the sale of the Brandt-Dent cash registers, in which ex-Congressman Driggs was interested. It is thus perfectly evident that the indictment and expected arrest of Beavers open up a wide field for further investigation and exposure, and render any attempt to hush up the scandal more impossible than ever.

The discussion within the navy as to the efficiency of the present engineering force, which has been raging ever since the amalgamation of the line and staff, goes on unceasingly. Capt. Bowman H. McCalla is the latest officer to assert that there has been no deterioration because

of the change. As arguments he cites examples of his own efficiency as a midshipman on the old *Marblehead* in 1864—which are not very convincing. More important is his belief that "the engines and boilers of our ships of war are today in better condition than they were prior to the Spanish war, aside from the mistakes and mishaps due to inexperience with new types." In this opinion he differs not only from Rear-Admiral Melville, but also from many other officers. The facts, too, would seem to be against him. He admits that in the largest ships the same engineers have charge who were in charge in 1898. But these men are either rapidly disappearing from the active list or are reaching the rank on attainment of which they are relieved from further sea duty. What is to happen when they have all ended their service on ships or been retired? This is the question that is being asked by those who are alarmed at the inexperience of the officers now commanding the engine rooms of the smaller ships. Is it not coming to pass that the warrant machinists are rapidly assuming the duties of the commissioned engineers of 1898, who were both better paid and better educated?

Judge Raymond's decision that an Indian parent may not lease the land of his minor child until he has been made its legal guardian, shows a wise regard for the future of the Five Tribes. But a small proportion of even the most progressive Indians are competent to judge of the value of land leases; and shameless exploitation of tribal property has gone on unchecked under cover of contracts made with Indians who have never touched a plough. A favorite form of lease provides that the lessee—any adventurous person with a team to take him into the Territory—shall have absolute possession and control of as much land as he can fence for periods varying from five to fifteen years. At the end of that term he turns over the "improved" farm to the lessor. As the so-called improvements usually consist of a rickety wooden shanty, "pole-and-hay" stables, and a two-wire fence, the Indian gets for himself, or for the child in whose name the lease was made, nothing but worn-out, weed-fouled fields, and dilapidated excuses for buildings and fences. Belated though Judge Raymond's interposition is, it will be welcomed by all who have an unselfish interest in the natives of the Indian Territory.

Mr. Justice Nash of the Supreme Court, sitting at Rochester, has refused to dissolve an injunction obtained by a machine company against a local lodge of machinists to prevent picketing and other interference with the company's employees. If Justice Nash is correctly reported, his decision is of far-reaching importance, and the view which the Appellate Court takes of it will be anticipated with great interest. He is quoted as maintaining that the common-law right of action for enticing away a servant or employee from his master has not been abolished, unless, possibly, where the object is to secure an advance in wages or to maintain wage rates. This strike was ordered because the company refused to sign an agreement that it would not employ any persons not members of the union, and also because it refused to discard the premium system in its factory. As neither of these positions assumed by the company affected the question of wages, Justice Nash decides that the rights of the master have in this case been unlawfully interfered with, and that there is no adequate remedy at law; he therefore refuses to dissolve the injunction.

It is a Southern man, Judge Jones, who states the lamentable inference to be drawn from the mistrial in the Turner peonage case at Montgomery. It will go out to the world, he says, that a white man cannot be convicted for oppression of a negro. Judge Jones did his duty. He went to the very verge of his judicial prerogative in charging the jury. He told them that if they believed the evidence presented by the prosecution, they must bring in a verdict of guilty; that even if they accepted only the admissions of the defendant, they must pronounce him guilty; and that they would perjure themselves if they took any other course. But, in spite of all, the jury stubbornly persisted in a disagreement. The cry of "politics" had been artfully raised by the Southern press. It had been insinuated that the North did not care about the punishment of the slave drivers, but only wished to make political capital out of a merely isolated and insignificant incident of Southern life. A leading Democratic State official was retained for the defence, with the apparent aim of playing upon the sectional and political prejudices of the jury. The result we see. It is the presiding judge himself who tells us that it is a frightful miscarriage of justice.

Mr. Edgar Gardner Murphy has for several years been rendering most valuable services to his State, Alabama, by carrying on an active campaign on behalf of better schools for blacks and whites, and against the iniquities of child labor in the mills of the South. He has now performed another important service by a letter to the Montgomery *Advertiser*, in which he correctly states that the "enemies" of the South are not those who print the facts about its ill-treatment of the negro, but those who would prevent the truth from coming out in such a matter as the peonage horrors. Mr. Murphy is able to take a far more optimistic view as to the extent of the peonage abuses than we can. But he manfully says that whether the new slave-drivers be "few or many, Alabama must be defended from them; their exposure and conviction is the best defence of the name and fortune of the State." Judge Jones, District Attorney Reese, and Mr. Murphy represent the best sentiment of the South to-day.

If lynching were to be expected anywhere, it would be in the Big Horn country, in which a mob has captured a jail and killed two murderers and a deputy sheriff. This region still has the manners and morals of the frontier and of the ranch. Owen Wister's Virginian, or some of his friends, must certainly have been in the mob of cowboys who could not wait for justice to take its course. But whoever would prognosticate where the next lynching will take place needs superhuman clairvoyance. North and South this defiance of the law, this readiness of hundreds to become murderers in order to punish others for greater or smaller crimes, manifests itself with increasing frequency. The "prominent citizens" of the South, the ruffians of Evansville, and the "bad men" of the frontier are in alliance, it appears, to defy the law. Even self-respecting and ordinarily peaceable farmers of this State are reported to have been affected by the mania. As for the victims, they are of all colors, and, we had almost said, of all conditions. Certainly the reasons for lynching are now embraced neither by murder nor by rape. Even an attempted crime is sufficient to make men stain their hands with the blood of a fellow human being. All civilizing forces in the community should be enlisted to bring home to every American citizen the infamy and the national danger of these crimes of the crowd.

When a man has reached the age of seventy and looks back over a career which includes three elections to the United States Senate, his maxims of statesmanship should be like apples of gold in pictures of silver; when for years he has been the leader of a great political party in New York State, his advice as to political success should be more precious than rubies. It was fitting, therefore, that when Senator Platt celebrated on July 15 his seventieth birthday, reporters should gather about him, eager to treasure up his lightest word. It was fitting also that the *Tribune* should print on its first page a picture of him in a bower of roses—a recognition of the warm friendship and tender confidence which have always marked the relations of that paper and Mr. Platt. As to statecraft Mr. Platt said: "I consider the in-

sertion of the gold plank in the Republican platform of 1896 through my efforts as perhaps the greatest accomplishment I have to my credit." This remark is specially interesting in view of the fact that Mr. Platt arrived at St. Louis the day after the fair, when the gold plank had already been agreed upon by the leaders. As to politics, Mr. Platt laid down the following principles that he had always observed: "Perseverance, truthfulness, fidelity to friends, fairness to foes; above all, strict integrity." The result of this steady adherence to the highest ideals has been a beautiful and well-spent life, cheered by the devoted companionship of such lofty idealists as State Senator John Raines, Louis F. Payn, Frederick S. Gibbs, George W. Aldridge, and Lemuel Eli Quigg.

Lovers of coincidences will note that the day which saw the walking delegates expel three labor unions from the Board of Building Trades, saw also the grand jury hand down three true bills for blackmail against as many walking delegates. What this federation has lost in membership has been promptly made up to it in indictments. For the moment the building situation is more mixed than ever. The old Board of Building Trades, controlled by walking delegates, has lost seven of its strongest unions, comprising probably a majority of the workmen of this trade. These seven unions, with certain allied bodies, have taken the preliminary steps toward forming a new central organization. All have accepted the agreement for arbitration of disputes arrived at in conference between the employers and representatives of the unions. In the fight between this new body and the board presided over by the noble Parks, it seems certain that the latter will be beaten. This should mean a general resumption of work, and peace so long as the unions and the employers live up to the terms of the treaty.

When some new Walpole collects "Anecdotes of Painters" for our times, Whistler's name will easily lead the rest. He was a bristling personality, and many who never saw his pictures talked glibly of his famous suit against Ruskin and of his numerous achievements in "the gentle art of making enemies." His sallies, frequently of an indiscreet sort, were freely handed about the clubs and drawing-rooms, so that he became fairly legendary as a wit, somewhat at the expense of recognition as a painter. His painting was far more delicate than his wit. It had, at its best, something of the austerity of his master, Velasquez, and rarely anything of the sensational. The fact that eccentricity was charged against the various "nocturnes" and "effects" was merely evidences of the dulness of the critics. He was so far removed from the dominant tendencies of the time that he required a cult, and promptly built one up. It is doubtful if he could have succeeded among us. An artist of his somewhat recondite quality must perforce find his place in great capitals where people are avid of novelties. All the world knows his beautiful picture of his mother and the Carlyle, two of the most perfect productions of modern art; and his etchings, which were formerly a laughing-stock, are now disputed in the auction-room like Rembrandt's and Dürer's. His influence upon modern painting has been on the whole unfortunate, for his methods and point of view were too individual to be grasped by the host of imitators. He is dead at the height of his fame. For years past he has been justly acclaimed as one of the very few moderns who can bear comparison with the great masters of old.

The Mantchurian agreement seems to meet with scant praise in the Far East. Japan interprets the proposed opening of a free port on the Yalu as a hostile move against Korea, and promptly gives check by demanding of China the opening of the opposite port of Wiju. The British representative at the Korean capital has pressed the same request upon the Korean Government—a striking reminder of the vitality of the Anglo-Japanese alliance. Meanwhile, it is suggested rather maliciously that Russia has offered two free ports to the United States, in the full assurance that China will refuse to ratify the agreement. Should China consent to play the part of Jorkins for Russia, the whole situation will become unpleasantly tense. The great desideratum in the Far East is the definition of Russia's position. Frank declarations either of hostility or friendliness to Russia's ambitions in Mantchuria, on the part of China, England, or Japan, would do much to clear the diplomatic air.

The final term put on Monday to the sufferings of the wonderful old Pontiff came as a relief upon that strain which all the world felt in the presence of his death-bed, and which was getting to be almost too painful. Use and wont had not dulled the acute sympathy which had been going out to him from all nations, all classes, and all creeds. The fact that there could be, in the nature of the case, no hope of anything but a postponement of the inevitable hour, has served, we think, only to heighten the pathetic interest with which the fatal struggle has been watched. An extraordinary constitution, reinforced by every resource of medical skill, drew out the contest almost cruelly. Yet the qualities of the mind and character of Leo XIII. never appeared more lofty than in these last days of mortal weakness. Our estimate of the work that he has done we have already given. He will rank at least among the most famous Popes. Time will be needed for a full and correct measure of his public career; but his personal character already stands revealed as remarkable above that of many remarkable contemporaries.

Mr. Chamberlain has certainly stirred up formidable antagonists. The wits are against him almost to a man. *Punch* covers him with ridicule in every number; the newspaper caricaturists are fleshing their swords upon him; while the inimitable Mr. Gould in the *Westminster Gazette* sets everybody roaring with laughter at his clever cartoons with their mirth-provoking legends. Political satire has always been a great power in England, and any public man must suffer who is visited with such floods of it as Mr. Chamberlain, especially when he can make no return in kind. Nor does the heavy artillery of the press let up on him any more than the sharp-shooting skirmishers. The *Economist* and the *Spectator* array fact and argument against his proposals in a way peculiarly damaging, considering the friendly relations, hitherto, of those journals with the party in power. It is even said that Lord Salisbury, in his retirement, has spoken strongly against the Chamberlain plan, and especially against the Chamberlain idea of political ethics. The London correspondent of the Manchester *Guardian* asserts on authority that Lord Salisbury holds it impossible to tax food in England, and also maintains that Mr. Chamberlain should have resigned from the Cabinet after his Birmingham speech.

"Practically annihilated." Such is the epitaph on the "ordinary mosquito" at Ismaïlia, according to a recent report of the Suez Canal Company. The happy result was due to the application of the well-known methods of mosquito extermination urged by Major Ross. It is further stated, in this report of the Canal Company to the Liverpool School of Tropical Medicine, that even the deadly malaria-bearing *Anopheles* has been attacked with great success. This will be good news, though no surprise, to the vivacious Major Ross, whose sprightly description of "mosquito brigades" moving upon the enemy of mankind must be familiar to many of our readers. What can be done in the tropics can certainly be done in the latitude of New York. One incidental good of the plague of the past three weeks has been the rousing of boards of health and local committees to renewed efforts against the mosquito. Science points the way to his extirpation, and thought and time and money applied to the work are as much called for as in any other form of public sanitation.

WALL STREET.

In the closing days of April, 1901, and the early days of May, the Stock Exchange was confronted with the spectacle of prices for stocks pushed up to heights undreamed-of before, and at a pace for which no precedent in our history existed. The amount of stocks bought on the rise was as extraordinary as the rise itself. It seemed at times as if some mysterious and unknown force were driving the market up, doubling in a fortnight the valuation of stocks whose rating the market had made from experience of years, and establishing for American finance what were called "new precedents." Again and again, conservative, old-fashioned financiers declared that prices, already wildly out of relation to real conditions, could not possibly go higher. They continued, nevertheless, to rise until, but for an incident which has since turned out to be most fortunate, the whole public bade fair to be trooping into Wall Street to get its share in the benefits of the miracle.

It is not very long since 1901; but intelligent people understand at present the phenomena of that year. The secret was that the surplus credit fund of a prosperous country, and as much of the foreign credit fund as could be borrowed or begged on the basis of that prosperity, was converged on Wall Street through a hundred varying devices. Credit of railroad companies was pledged to buy up at high valuations the shares of other roads; credit of industrial concerns to buy up the shares of other industrials; credit of banks to equip promoting syndicates; and credit of syndicates and individuals to sustain artificial prices established on the markets. Only one consideration seemed to be overlooked, namely, that pay-day has to come, and that, the more reckless the borrower, the sooner, usually, such a day of reckoning arrives.

What Wall Street has been witnessing during the past week is a singularly perfect complement to the events which we have recalled. Stocks have been falling to depths which, a few months since, would have been pronounced impossible. Prices of dividend-earning shares have been almost cut in two. Again and again, as in 1901, experienced financiers have declared that the stock market was absurdly low, and that it could not possibly go lower. Yet, after each prediction, a mysterious force which none of the experts could measure or define, drove prices down still further. Nor does the analogy or antithesis stop here. Precisely as in May, 1901, the light-headed part of the community inferred that certain financiers had discovered the philosopher's stone, and were benevolently making every one rich by stroke of pen, so in July, 1903, the same profound observers grasp at the notion that malign and potent capitalists are "marking down prices" to help out their own nefarious schemes.

With all the mystery which has surrounded each of these episodes at the time, there is no obscurity at all in what has really happened. The scheme of inflation by reckless use of credit broke down, as such schemes invariably do, when the lenders asked for the real capital. Nothing is more familiar, in all the history of finance, than such occurrences. It is only when such an undertaking, by the portentous magnitude of the liabilities involved—a South Sea bubble, a Mississippi Company, a railway mania in the forties, or an Argentine exploitation in the nineties—rises to heights and falls to depths which draw the wondering gaze of the world at large, that we treat it as a landmark in history.

We presume, in spite of the darkness which envelops the recent collapse in prices, that the people who have suffered chiefly are the ones who reaped their golden harvest during the wild days of 1901. If this were all, we should merely have an example of the law of compensation. Unfortunately, it is not all, and never can be all, so long as such adventures are involved with the ramifications of outside credit. The most astonishing spectacle of the present time is the arrival in the money market of great and powerful corporations, sound in resources and high in traditional credit, only to find that the investor will not lend to them except on terms the most exorbitant, and that the banks will discount their notes-of-hand only at rates which a retail tradesman would lately have rejected as preposterous.

We have no quarrel with the railways for planning to use the capital thus applied for in extensions and improvements. We do not doubt that its use, as planned, is generally wise and in some cases necessary. The two typical instances of hard-pressed railway borrowers have been the Pennsylvania and the New York Central, and we are very sure that, if the Pennsylvania were to abandon its tunnel project and the New York Central the promised reconstruction of its track approaches, there would be something like public protest. Yet it is precisely for these purposes that the money has just been wrung out of reluctant Wall Street.

A more pertinent and pressing question is, What had happened to the mental processes of the people who used up the country's credit fund and its foreign credit in haphazard stock-promotion enterprises, or, to be more polite, in "community-of-interest" schemes, that they threw thus completely from their reckoning the needs of the industrial future? The teaching of the past was absolutely plain. It is, that every great forward movement of national prosperity must be accompanied and followed by greatly expanded requirements for plant and facilities with which to conduct and profit by that prosperity. Our promoting financiers acted as if the only use for the country's increased capital was to inflate the valuation of plants and facilities which already existed, and in this process they absorbed, not merely the capital then pressing on the market, but, by anticipation, the capital which should accrue in the next half-dozen years. We have already seen the results of such finance in the case of the new "industrials"; last week's costly loans tell the story for the railroads.

How much further the footing of the bill will have to go, we certainly do not feel competent to predict. Ramifications of credit are so extensive that general tendencies in a money centre are usually slow in developing elsewhere. It needs no prophetic power, however, to perceive that when borrowers like the Union Pacific and the Lake Shore are paying exorbitant rates in the open money market, it is a time for smaller borrowers, present and prospective, to exercise the greatest caution in all their plans.

"NERVE" IN DIPLOMACY.

Russia's refusal to consider or even to receive the Jewish petition inevitably leaves the Administration in the position of one having made a false step. It is obvious now that the proper order was not followed. The President gave it out that he had decided to forward the petition to the Czar. Then, as a second thought, came what should have been his first thought, and he decided on a preliminary inquiry whether it would be agreeable to the Czar Nicholas to receive an appeal from American citizens. It now having been ascertained that it would not be, the President is powerless to go further. The only awkwardness of this is that he had somewhat rashly undertaken to go further. As a display of good will and of hearty sympathy with an outraged people, the incident has been another of the President's successes. Diplomatically, we cannot see that it adds to his laurels.

We think Judge Brewer did the President only an ill turn when he asserted, in an address last week at Milwaukee, that Mr. Roosevelt had "the nerve" to send on to the Czar petitions signed in this country. This is but to give an unhappy turn to the whole affair. If we are thinking more of our own magnificent audacity than we are of really doing any good by its display, we lay ourselves open to both ridicule and reproach. Yet the Judge's phrase comes forcibly to remind us of the real ends and the successful methods of diplomatic intercourse among the nations; as also to reveal to us how the current discussions have mixed things up. Those who are most shocked by the horrible persecutions of the Jews in Rus-

sia, and who are most anxious to make their sympathy with all oppressed races effective—and we yield to no one in either particular—must yet admit it to be their duty to choose their measures wisely.

Now "nerve," we remark, is as much out of place in diplomacy as it is in cultivated society. By nerve we understand something irregular, presuming, perhaps offensive. The man whom Coleridge observed in the inn, and who, in a burst of irritation, smeared mustard on the plate of a recalcitrant stranger, crying out, "D—n it, Sir! You must and shall eat mustard!"—had no lack of "nerve." And if the chief end of diplomacy, or of human intercourse in general, were to shock people, to violate the conventions, to be self-assertive, to score off others triumphantly, then the more nerve put into it the better. But, luckily, the art diplomatic moves in no such boorish fashion. Nations, to get on with each other, have to employ the same means of maintaining friendly and agreeable relations as individuals if they are not to be forever by the ears.

We can easily conceive that President Roosevelt, in undertaking to forward to the Czar a numerously signed petition in favor of justice to the Jewish subjects of Russia, was prompted by humane and admirable motives. His visitors got on his weak side—or his strong side, if you please—his chivalrous love of fair play, and affection for the under-dog. And so, though both he and Secretary Hay had publicly asserted the obviously correct view that this Government, as such, had no shadow of right to make representation to the Russian Government on the subject of the Kishenev massacres, he later agreed impulsively to forward the petition in his personal capacity. Probably it seemed to him the most natural thing in the world to do. Is it not a neighborly act, done every day, to serve as intermediary in the transmission of messages and letters? "To the Czar. Kindness of Theodore Roosevelt." That was, apparently, the President's idea of the way in which the envelope would be addressed and the whole business dispatched. We do not, with Judge Brewer, see in this an exhibition of "nerve." It was, rather, evidence of a certain valorous inexpertness. Better advised, Mr. Roosevelt decided to ask first if the Czar were willing to receive a respectful petition from American citizens, and, if the answer was in the negative, to let the whole matter drop.

Let no one say that we argue for a rule which would forbid one nation to remonstrate with another. Nations are doing that all the time, and are doing it with perfect diplomatic propriety. But they always have to show that their own interest is somehow involved in the subject of representations. It may be a tariff law, for example. That is purely an affair of internal legislation, but if it has the effect of prejudicing the trade or the treaty rights of other nations, they may properly bring the matter to the attention of the responsible Government. Even when, as in the case of our diplomatic approaches to Spain in the matter of Cuba, the element of injustice or inhumanity comes in, the protesting Powers are careful to show, as were both President Cleveland and Mr. McKinley, that the injury to their own people is the main ground of intervention. That is the broad distinction always to be made, in all dealings of civilized and Christian Powers with each other. No one pretends that it exists in the present case. Indeed, both Mr. Roosevelt and Mr. Hay have explained that it does not.

It cannot be denied that there is a sense in which it takes a great deal of "nerve" for America to rebuke Russia, even by implication, for the outbreak of brute passions. We are just now unable to cast a stone at the most lawless country on earth. How exposed to retort or to sarcasm we leave ourselves in that way can, perhaps, be appreciated only by one who reads the foreign press. Here, for example, is what M. de Cassagnac says in *L'Autorité:*

> "When a country makes a common practice of lynch law, and amuses itself by covering negroes with oil and burning them alive, it only excites general laughter by taking up with such improvised humanity the defence of the Jews of Kishenev."

That kind of rebuke would be unpleasantly multiplied upon our head if the champions of "nerve" in diplomacy were to be given free swing.

THE REOPENED DOOR.

The method by which the United States has negotiated for free ports in Mantchuria is instructive. Secretary Hay and the Russian chargé d'affaires met in Washington and came to terms for China. Their preliminary agreement has been sent to Pekin for confirmation by the Emperor, whose assent is taken for granted. In other words, while asserting the integrity of the Chinese Empire, Mr. Hay practically recognizes Russia as suzerain of all northern China. So the Mantchurian question has passed out of the political into the commercial stage. Russia is in full possession of Mantchuria to-day, although she is technically restoring a province or so a year to China. Unless Japan wishes to take the great hazard of challenging the Russian claim, and strikes quickly, Mantchuria will soon be more Russian than the Duchy of Finland. By a significant coincidence, as the Russians are granting the trade concessions for which Mr. Hay has been battling, it is reported that the conference of Mantchurian officials at Port Arthur has advised the appointment of a Russian viceroy over the provinces which, barring "obstacles," Russia has promised to evacuate next September.

Rightly to weigh the value of Mr. Hay's treaty, it should be realized that he probably maintains the diplomatic fiction of a Chinese Mantchuria merely as a pious hope, and as a technical advantage in negotiating with the most slippery of Foreign Offices. What Mr. Hay is after is trade privileges. He has exhausted all the resources of diplomacy to force Russia to grant free entry in Mantchuria to all the world. He very properly insists upon all the commercial advantages that he could have obtained from China, and, while not formally opposing the steps which lead to Russian occupation, he has valiantly opposed all measures that tend to give Russia a monopoly of the trade of North China. Here it is that the dogma of the integrity of the Chinese empire becomes a very useful fiction. The Russians are thoroughly committed to it. In 1901 they cheerfully withdrew, largely owing to Mr. Hay's protest, the treaty which would have given their "lease" the value of a deed in fee simple. Again, in the Mantchurian Convention of April, 1902, they agreed successively to withdraw from the various Mantchurian provinces. They have shown every disposition to humor those who were stiff on the point of Chinese suzerainty, but have quietly built railroads, erected custom houses, and discriminated against non-Russian imports by railway rates, and by collecting a kind of *likin* tax on goods in transport. Content with the substance of a trade monopoly and political control, they have gladly allowed it to be called a mere extension of their sphere of influence; but the various protests in behalf of Chinese sovereignty have been incidentally the means of pinning Russia down to trade agreements.

During all this time Mr. Hay has protested against the closing of Mantchurian ports, and has with unwearied importunity worked for the "open door." Theoretically, the door has always been open. The Russians in 1900 went on record as to the principle, and subsequently they have given Mr. Hay ample assurances that, certain obstacles removed, the door would be open to stay. To-day he simply has one more promise. Yet it is a considerable gain to bring the Russians to so definite an action as that of naming two free ports, even if no time has been set for the actual opening. It is suggested, possibly by a wit, that the ceremony will follow on September 8 next, the agreed date of Russia's final evacuation. The value of the ports of Mukden and Ta-Tung-Kao is difficult to estimate. Mukden is the great caravan centre for Mantchuria and Eastern Siberia, but unless such feeding ports as New Chwang, Port Arthur, and Dalny are also made free (as regards products in transit for Mukden), the value of free entry at Muk-

den only comes to the remission of any transit tax there levied. The concession will be quite an empty one unless the seaport Ta-Tung-Kao be connected with Mukden by railway. This will require time, and time is a famous collaborator of the Russians. It will compel the construction of a railway to the estuary of the Yalu, and if the "civil buildings," as is not uncommon in Mantchuria, should assume the look of fortresses, Russia would be in a comfortable position of control at the mouth of the Yalu, and at a strategic vantage point as regards Korea. That is, by the concession of a free port, Russia will go amicably where otherwise she would hardly have dared to advance so soon. Accordingly, it must be also a wit who suggests in the press agency dispatches that Ta-Tung-Kao was chosen in deference to the desire of Japan.

And yet, with all the mental reservations which the compact implies, Secretary Hay is to be heartily congratulated upon the conclusion of a most difficult and vexatious negotiation. In a sense, the interested powers have rather shabbily thrown their case upon his hands; where Germany has been cynical and England despairing, they have left the difficult rôle of optimistic endeavor to Mr. Hay. His failure he would have had to bear alone, his success was certain to be their profit. On these conditions and with rather little intelligent support from his own countrymen, Mr. Hay has crossed swords with the shrewdest blades of modern diplomacy, and has scored his touch handsomely. He alone really grasped the significance of the Russian occupation of Mantchuria, and saw the danger of shrinking markets. Diplomacy has seldom taken so long a view and foreseen so accurately the needs of posterity. This will be remembered to Mr. Hay's lasting credit, even if the technical triumph of to-day should seem smaller when the new agreement is interpreted at the custom houses of Mantchuria.

THE MAYOR ON CITY FRANCHISES.

It is evident that Mayor Low is now fully alive to the necessity of protecting the city in its franchise rights. At a meeting of the Rapid Transit Commission a few days ago he blocked a scheme to hurry through a hastily prepared franchise for another North River tunnel. At Thursday's meeting the same franchise, now in printed form, came up for consideration; he again refused his sanction or vote, and announced some exceedingly plain truths bearing upon the relation of the public to local transportation companies. He particularly objected to a clause in the contract permitting the sale of the franchise at will by the grantees, insisting that for such a transaction the consent of the city should be required. This position of his is thoroughly sound. One of the principal difficulties in forcing proper service from transportation companies has been the disappearance of the original responsible company in some combination or holding concern. Among the excuses made by the Metropolitan for not giving the transfers required by law was the statement that its system is now operated by a small company located in Westchester, whose only tangible possessions are a mile of track, a car barn, and four old-fashioned cars.

Mr. Low also proposed that the city retain power to order better service whenever it saw fit, subject to review by the Appellate Division. This is only to recognize the principle of necessary public control of transportation facilities. It is fair to assume that the Mayor has taken his stand, not only in regard to a North River tunnel franchise of comparatively trifling importance, but in regard to transportation franchises in general, including the most vital of all, the subway extensions. It is plain that he now realizes that it makes little or no difference what provisions are put in the franchise, charter, or contract, so long as the means of enforcing them are wanting. He asks that the burden of proof be shifted from the city to the public-service corporations. This is well, but does the Mayor go far enough? Would a clause in the contract giving the city power to order changes in service or equipment, with an appeal by the railway company to the Appellate Division, really be effective Or would it cause more litigation, during which the company might please itself as to the sort of service rendered?

This, clearly, requires consideration. It would be most unfortunate, certainly, ready to revolt as we are at the helpless condition in which we find ourselves, if we were to seek and secure a change only to discover that under it we were still unable to command the service which we require. It is uncertain, to say the least, how far the courts would be willing to pass upon and enforce the orders issued by the city under such a statute. Our courts pretty steadily decline executive functions, and, when they do not refuse them altogether, it must be admitted that they perform them rather indifferently. Nor do they always deem it wise, apparently, to hold public-service corporations to the strict letter of the law or of their bond.

The Auchincloss case, for example, has been in litigation for more than ten years. In that the plaintiff prayed for an injunction against the Manhattan Railroad Company prohibiting it from operating its third track on the Ninth Avenue road, on the ground that the company never obtained the right to lay or operate this track. The Appellate Division, sustaining the contentions of the plaintiff and sending the case back to Special Term for final adjustment, clearly held that the company had not acquired the right to the third track. But Judge Truax, at Special Term, while awarding extensive damages to the plaintiff, refused to interfere with the operation of the third track, on the ground that to do so would "impose great hardship on the defendant company and would curtail their ability to serve the public." This is doubtless sound enough legal doctrine, but the counsel who had conducted this litigation on behalf of the plaintiff has exhibited to the public a company enjoying a valuable right for which it pays not one cent to the city, which it never acquired by any legal means whatever, and with which the courts refuse to interfere (except in the matter of damages to individuals) because, in the process of time, the service under this unauthorized and unpaid-for franchise has become a public necessity.

We do not cite this instance to criticise the ruling of the court. On the contrary, we agree that the public would be the chief sufferer if the company were ordered to remove its third track. But it illustrates how even the public necessities hinder the city from holding transportation companies to proper performance, when once absolute rights in or under the streets have been granted away. And the lesson of that seems to be, not to grant away such rights, even with an attempt to retain control of the service by means of an experiment with initiatory orders in the hands of the municipal Government, subject to judicial review. There is a simpler means than that, and one which runs on all fours with experience and ordinary business principles. This is the short-time lease under contract. By such a system, public control can be rendered truly effective. Companies failing to give the requisite quality of service would simply lose their contract, like any other unfaithful servant, and be replaced.

ART SCHOOLS.

It has frequently been noted that art declines somewhat in the ratio of conscious effort to further it. The great periods knew only masters and disciples; the times of decadence abound in academies and permanent schools. At present the fact may easily be verified by any one who will visit successively the Royal Academy at London, the Paris Salon, and the current exhibitions at Amsterdam and The Hague. London and Paris have elaborate systems for producing painters. Before those who study at the Academy schools or the École des Beaux-Arts, lie all manner of official honors and material rewards. The academicians of either country enjoy a traditional prestige and a corresponding social position. Holland, on the contrary, does next to nothing for her painters. They study in small bands

of disciples about the older masters, they wander through the schools of France and Germany—in short, like Topsy, they just grow, without the fostering care of academies and ministries of fine arts.

Comparing the painting of Holland with the academic production of France and England, one is struck with the sobriety and excellence of the Dutch school. There is, first of all, a genuine continuation of the tradition of the seventeenth century, which rests, not upon organized authority, but upon the temperament of individual artists. The level of craftsmanship is higher than will be found elsewhere. There is a refreshing absence of incompetence and eccentricity. These painters know their subjects—chiefly the landscape and peasant life of their own country—and know how to make paint assume the look of light, air, and life. Yet there is nothing backward about the school. It has freely profited by all the recent innovations, impressionistic or otherwise, without yielding to the eccentricities in vogue. Everywhere one notes good judgment and sound accomplishment—that is, precisely the qualities which academies are founded to promote.

How ill academies do their work to-day is shown in London and Paris. Go through the Royal Academy or the Salon and your eye will infallibly reject the native product and rest upon some quiet bit by an American, Dutch, or Scandinavian painter. For more than a hundred years the Royal Academy has been the custodian of British art, and the result is stupidity, ineptitude, mediocrity. For nearly two hundred years the Salon has been subsidized by the State, and the result is incredible vulgarity. The three thousand pictures annually exhibited by these two academies have very little to do with art. In England they are painted to be sold to a sentimental and untrained public; in France they are painted to be exhibited to a calloused and mistrained public. In London the official encouragement of art has seemingly produced an entire obscuration of talent; in Paris it has drawn a great supply of talent into vulgar ways of seeing and painting. In one case art languishes from too little skill, in the other it perishes from skill perverted.

Moreover, the saving remnant of French and British painters have held aloof from the academies. Indeed, the various secessions from Munich to New York are so many signs of discontent with the cut-and-dried methods of the schools. And as these revolutionary bodies become formalized they in turn drive out the best spirits, so that the more accomplished artists are generally to be found isolated from the craft, or joined in small congenial groups. It appears that we have to do with a secular process by which art ever renews itself only on condition of renouncing official patronage. That would seem the moral of Holland, France, and England to-day.

As usual, the trouble lies at the root—in the art schools. Never in any healthy period of art has an apprentice spent years in making "studies." From the first the pupil was taught to do things that were useful. If it were only laying in a background or tracing a cartoon, his earliest efforts contributed something to the art of his time, and his equipment was gained not in profitless competition with those who were no better than himself, but in daily contact with a great master. All the studies and investigations which are comparatively dead in themselves, he made under guidance and in view of genuine problems. To-day men work seven or ten or more years for the great stake of artistic success; if they fail, that time is relatively thrown away, and they are subjected to a kind of humiliation which befalls no other class of earnest workers. Under the old conditions of discipleship, every art student had the satisfaction of serving usefully, and those to whom greatness was denied at least found naturally their places as artist artisans and the like. Such tragedy of utter failure as we see not uncommonly to-day was hardly known until the great art mills were invented to sweep in those who had no vocation, and grind them out half-trained or mistrained. To be sure, wholesale methods have replaced discipleship in many other branches of study; but in these it has not had the same stupefying results. You may make tolerable doctors or lawyers by machine methods; the training of the artist is peculiarly an individual matter and not to be entrusted to the syndicates.

Probably no M. Combes of painting will expropriate the art schools of the world and scatter the "professors." Very likely it would be better if such a tyrant would compel a return to discipleship. In any case it should be understood that no more great art schools are needed. The rumored National Gallery at Washington will only add to the bad art in the world if it sets up classes on the conventional lines. Before any millionaire endows a teaching academy, let him go to Holland and see how art fares when patrons and the State observe a wise passiveness, and art shifts for itself.

SOUTH AFRICAN CONDITIONS.

At the time of the capitulation after the Boer war, Gen. Louis Botha took a singularly wise and conciliatory attitude. It was he more than any other who urged the Boers to accept the new government cheerfully, and was constant in expressions of confidence in the liberal intentions of Lord Milner and the British Colonial Office. Thus it is Botha's reputation for moderation which gives to his recent manifesto denouncing the colonial government as despotic a peculiar weight. It is even said that he is going to England to plead the cause of his countrymen.

From Gen. Botha's letter, and many other sources, it appears that there is one prime obstacle to reconstruction in South Africa, namely, Milnerism. Lord Milner has eminent abilities, but he is and must be *persona non grata* in the old Boer territory. His relations with the Boers had become so thoroughly embittered that it was a mistake to retain him as Governor-General. Recently he has appointed many Oxford graduates to office. These young men bring to their duties abundant ignorance; they are prone to treat the Boers with condescension, and in many cases they are both inefficient and unpopular. Time will do much to remedy these deficiencies, but, in the meantime, when it is above all things important to conciliate the Boers, they get the impression that the Government neither understands them nor cares for their welfare. It is a sorry sequel to Mr. Chamberlain's visit of conciliation that South Africa is to be kept a crown colony indefinitely and garrisoned strongly at great expense.

Possibly a graver danger than that of being ruled by Oxford graduates and "single men in barracks" is that of being exploited mercilessly by the great syndicates. Although the powers of the British South Africa Company have been abridged, there is still a far too intimate connection between it and the colonial government. The same may be said of Mr. Beit's diamond monopoly, and of the Transvaal gold interests. For example, the great diamond fields recently discovered at Elandsfontein—a possible rival to Kimberley—have been closed to individual prospectors by decree. Some 4,000 claims which would have been worked immediately are tied up until the De Beers syndicate absorbs them all; and the reason offering for abolishing the "pegging" right is that "it creates gambling in valuable assets." Naturally such gambling is detestable to the diamond monopolists whose game the Government is making a sure thing. The political power of this company may be measured by the twenty-odd papers it controls in South Africa.

Mr. Chamberlain, in his recent tour through the "illimitable veldt," did not get as far as Rhodesia. Had he done so he would have found that stubborn parochial problems turn up even on the fringe of empire. We have before us a little pamphlet entitled 'The Reform Movement in Rhodesia,' printed at Salisbury by a committee of prominent citizens. It is a complaint against the oppressive freight rates charged by the Beira and Mashonaland Railway. This line, though nominally independent of the Chartered Company, runs in community of interest with it. The rates charged for the 374 miles' haul are preposterous, averaging

three times the rates levied by the Uganda and the Port Elizabeth-Johannesburg railways, and more than twice those of the Delagoa Bay Railway. Take a typical example: It costs about $63 to send a ton of spades and shovels from Beira to Salisbury, as against $23 for a similar distance on the Delagoa Bay Road. Again, five tons of flour (about 50 barrels) costs $243 from the steamer to Salisbury, while eleven horses are charged $258 for the 188-mile haul from Gwelo to Salisbury. What these prohibitive rates mean to the hardy settlers who some dozen years ago followed Cecil Rhodes's star to the Zambesi valley, may be imagined when it is recalled that the cattle have largely perished of the rinderpest, and the people are dependent upon imported food. "At a hotel table in Salisbury one finds scarcely an indigenous product, from the bread baked from foreign flour to the ham from English pigs." But cattle, and almost food, are denied them by the South African Railways Trust.

It would be easy to point out that the Beira Railway is pursuing a short-sighted policy in bleeding a new community to the discouragement of its growth; it is not so easy to explain the action of a government that charters a railroad and makes no provision for an initial agreement as to rates or subsequent control of them. It can hardly be wondered at when the Salisbury committee says that the disease undermining Rhodesia takes the form of "a fine Imperialism degenerated at length into commercial avarice."

Paul LeRoy-Beaulieu pointed out recently in the *Économiste Français* that it would take from three to five years to put the Transvaal gold industry on a satisfactory basis. Much trouble may come before that time. Great Britain may be called on as guarantor of the South African loan, and to disaffected Boers may be added an increasing host of discontented pioneers of English blood. The incidents of the new diamond fields and of the Mashonaland Railway show clearly that South Africa needs a government which will hold the syndicates in check, and prevent at least the more oppressive forms of commercial exploitation. Lord Milner has signally failed in the task, and it is a question if this severance of administration from the activities of the various chartered companies is so much as dreamed of in Mr. Chamberlain's philosophy.

LEO XIII.

Leo XIII., Vincent Joachim Pecci, was born in the little Italian town of Carpineto, a miniature fortress of about 5,000 inhabitants, hidden high among the Apennines. It was at one time a place of some importance, and was destroyed by the Romans. In the Middle Ages the Conti, the Caetani, and other powerful families held sway over it. Later it was a duchy under the Aldobrandini family; but, for the last three centuries, its most important people have been the Pecci, who have here a large estate and a country-seat of some pretensions. Originally they came from Siena. According to a monograph compiled by the present Pope in 1832, when a young man of twenty-two, the first Pecci of whom record remains was a certain Benvenuto, who was a Knight of Malta and was born in 1340. Later there is mention of a Pecci in Spain. In the sixteenth century, Bartolomeo Pecci was deputed by Siena to ask Pope Eugene IV. to canonize St. Bernard of Siena, and not only succeeded in his mission, but was made Chevalier. During the fifteenth-century troubles of the papacy, the Pecci espoused the Medici cause and emigrated to the papal dominions, settling in Carpineto in 1534. The head of the family was then Antonio, whose son was made Governor of Foligno by Pope Clement VII. In the succeeding three centuries the Pecci family furnished many men of distinction to Rome and Italy. At the beginning of the last century the head of the family was Ludovico Pecci, who, like his father, was a soldier, and became a colonel under Napoleon. There is a good portrait of him now at Carpineto. This follower of Napoleon was the father of Joseph, the Cardinal, and of Joachim, future papal nuncio to Belgium, future Bishop of Perugia for thirty-two years, with a constantly growing reputation for tact and courage. Almost insensibly, his place in the Church of Italy grew in importance. His course during the critical years from 1848 to 1870 was marked by moderation and wisdom. There was a patriarchal simplicity about his administration which had its effect upon friend and foe, and it was no surprise to Italy when Pius IX., who had made him a Cardinal in 1853, named him "Camerlengo," the officer to have charge of the affairs of the Vatican and of the conclave called to elect a new Pope. On the 7th of February, 1878, the Pope died, and Mgr. Pecci took charge of affairs at the Vatican. His election followed almost as a matter of course, and he entered at once upon an office for which he had many fortunate and some admirable qualifications.

The ruling passion of Leo XIII. was for the assertion and the restoration of his rights as a temporal sovereign. His democratic sympathies, in which some have found the most characteristic feature of his pontificate, were far less distinguished; and while it would be most ungracious to think of them as means adapted to a personal or ecclesiastical end, it does not appear that they ever stood in the way of the purpose to which he held from first to last with a singular persistency and with much incautious zeal, endeavoring to compel all Catholic statesmen to subordinate their political energy to the welfare of the Roman See, and identifying this welfare with the fiction of its temporal power. Always the political controlled and modified the ecclesiastical and religious tendency. Thus, when the German Catholics were ready to defeat the septennate military bill on which Bismarck had set his heart, they were suddenly ordered to support it at the sacrifice of their convictions, while a little later they were castigated for supporting Bismarck in a course which was deserving of their patriotic adhesion. The "godless schools" of Italy were frequently condemned, while the more drastic secularism of France in educational matters was allowed to go unscathed. The French encyclical of February 16, 1892, was received with general indignation, and a policy was set on foot for evading its provisions; but a second papal declaration made it clear that French Catholics were expected to be eager partisans of the *de facto* government, whatever the *de jure* aspect of the case might be. In the meantime Russia's opposition to the Triple Alliance secured for her absolutism the same consideration as that accorded for the same reason to republican France, while the adhesion of Austria-Hungary to the Alliance earned for that stronghold of Catholicism the utmost severity of the papal frown, and encouraged internecine feuds that are now gnawing at the vitals of the national life. And all of these tendencies, so obvious elsewhere, culminated in Italy. The Triple Alliance was anathema to Leo, not as an alliance against the strength of Russia, but as an alliance favorable to the weakness of Italy in the European family.

It would be a grave mistake to seek the characteristic quality of Leo XIII. in his democratic or socialistic affiliations, or in his practical activities as a sanitarian reformer. All honor for the aqueducts and hospitals which he built and for his genuine sympathy with poor and miserable men! But these things did not assure to him the modern spirit. His idea of the temporal sovereignty of the papacy was of course a mediæval idea. The methods he pursued in the vain hope of making that idea a reality were also mediæval. There are those who think and speak of him as a great statesman and diplomatist. They rank him with Bismarck and Cavour. But whatever he attained upon their lines by his astuteness and his pertinacity, and however great his influence upon the contemporary politics of Europe, it cannot but appear that the main object of his pursuit was an unreal thing, while, had the energy he spent upon it been used in strengthening his spiritual supremacy, the gain both for his office and the millions of his people would have been incalculably great. The enthusiasts for lost causes have been many, and he takes his place among them with something of peculiar dignity, so majestic was the historical reality the shade of which he clutched with eager hands, and so evidently might he have been a worthy successor to the temporalities of Hildebrand and Innocent and Boniface if he had not been born some centuries too late.

His pontificate was, nevertheless, in its general aspect, much more liberal than his predecessor's, and had a different course and tendency from that which, beginning with a liberal policy, soon became timid, reactionary, and conservative, and on the dogmatic side carried matters so far with its decrees of the Immaculate Conception and Papal Infallibility that Leo XIII. could carry them no further if he would. It may well be doubted if he would have carried them so far if he had had the opportunity of Pius, and it is certainly very significant that one of the first acts of Leo was to make Newman a Cardinal, as if to reward him for his opposition to the dogma of infallibility, or condone the offence, while Manning, who had been foremost in urging the declaration and subsequently one of

the highest in the counsels of Pius, passed with the accession of Leo into comparative neglect.

The official career of Leo in the Vatican presents many interesting phases; his concessions to Bismarck in the closing scenes of the *Kulturkampf* and Falk-laws agitation, his relations with Poland and Russia, his subjection of the French bishops to the secularism of the republican régime, his unfortunate interference with Hungarian affairs, his yet more unfortunate *De Parnellio* letter, which, but for the prompt and energetic interposition of Cardinal Manning, might have made an Irish schism from the Church, his arbitration in the affair of the Caroline Islands (his most obvious contribution to that "peace on earth" which Christianity is supposed to encourage and advance), his dealings with the American-school question and the vagaries of Dr. McGlynn, and in general with the social-economic problems of the time in his encyclical *Rerum Novarum*. Always more interested in practical affairs, or in what he conceived to be such, than in dogmatics, his elaborate encyclical on Biblical inspiration and criticism was foreign to his genius and consequently more, if possible, of a mere *brutum fulmen* than any other. To the higher criticism it extended a cordial greeting, and advised its hospitable entertainment among Catholic teachers and scholars, but with the understanding that certain foregone conclusions of the more general sort must be the test and goal.

This letter and the social-economic one, together with that of June, 1893, on the American-school question, afford our best materials for the study of Papal infallibility as a working theory. They seem to show that it tends irresistibly to triteness or to an Hegelian union of contradictories. Take the American encyclical of June, 1893. Following the plan of Archbishop Ireland, the decision *Tolerari potest* in 1892 seemed to acknowledge frankly the right of State control over parochial schools. So did the Archbishops' resolutions of November, 1892, dictated by Satolli, who was evidently following instructions straight from Rome. But these resolutions were radically opposed to the decisions of the Plenary Council of Baltimore (1884), which since their passage had been the programme of the high and dry Roman Catholics, whose coryphæus was the late Archbishop Corrigan. Such being the situation, what was the course of Leo XIII. in his encyclical in 1893? He had a good word for the Baltimore decisions, and he approved the resolutions of the Archbishops which allowed the right of Roman Catholic parents to educate their children in secular schools, and the right of State control for the parochial. Here was a Barmecide feast for the high-church party and a substantial meal for Archbishop Ireland and his friends.

THE AMERICAN PHILOLOGICAL ASSOCIATION.

July 19, 1903.

The American Philological Association has come and gone. It came without observation; it should not go without notice. It was the thirty-fifth annual session. The place was New Haven, the host was Yale University, the time was July 7, 8, 9. The sittings were held in the Trowbridge Library, in the Marquand Chapel, and in Osborn Hall. The Trowbridge Library is dedicated, or abandoned, to works of theology. Philology sat in the midst and left the shelves unmolested.

There were about sixty members in attendance. Some made but a short stay, about forty endured to the end. The public is always admitted; but the public does not seek philologic learning in July, even in New Haven. Some inquirers there were, however. A few venerable heads gave attention, and there were some women. The Association counts thirty-nine feminine names on its roll, with perhaps a few more concealed under epicene given names or initials.

There were forty-three papers on the printed programme. They were not all read from paper. They were often spoken, in summary, in selection, or as the bee sips. Some were well spoken, out of a full mind and a practised mouth; yet the most eloquent speeches (and there were several eloquent speeches) were read from manuscript. The older men seem to prefer a pedestrian muse, and are most at ease in peripatetic confabulation. They abound in "excursions," but they raise no "alarums"; and no trumpet is heard in the wings. The Association, it is well known, is very intimate with the Greeks and Romans. More than two-thirds of the papers were concerned with Greek and Roman matters. It is the annual rule, or custom; nor can any fault be found with these papers as to their subject—they are certainly "parleyings with certain people of importance in their day." Yet the Association is expressly general. Its object, as stated in the Constitution, is "the advancement and diffusion of philological knowledge." These words recall the principle of the Smithsonian Institution, "the increase and diffusion of knowledge among men." The Association has the same object, within the field of philology. The other philological bodies of national range express in their names their chosen divisions of philology—the American Oriental Society, the Archæological Institute, the Modern Language Association, the American Dialect Society. Local philological societies, too, of general or specific scope, are rather numerous. All this is well. These divisions and fences are useful, and promote accuracy. Some languages are kittle cattle, and require a close pen; but the philologist should have the key of the whole farm. The specialist should range at times abroad; and the generalist, if there is such a person, is nothing if he is always on the range.

The Philological Association in its earlier years opened its gates to all philology, Greek, Latin, Sanskrit, Hebrew, Arabic, Celtic, African and even "Amerindian," though that word had not then been added to the vocabulary. The earlier volumes of the Transactions contain papers on Algonkin, Cymric, Tupi, and English; nor have these and their like been wholly neglected since. Yet the Greek and the Latin, the basis of all philology and its very vocabulary, have always been in the fore. The very first paper printed in the Transactions is one by James Hadley, "On the Nature and Theory of the Greek Accent" (1869, not settled yet in this year of grace, 1903). It is odd, however, to see that Latin does not appear in any phase in the Transactions until the fourth volume, and that the Latin subjunctive delays its emergence until the tenth volume.

But to return to the session just ended. The Greek papers were seventeen. Four or five were grammatic. The most entertaining paper in this sometimes gloomy galley was Professor Humphreys's confabulation entitled "Notes on Greek Grammar," being good-natured comments on other men's notes in Greek grammars. One illuminating note was his quotation of the statesman who declared in a speech that "he had always endeavored to tread firmly the narrow path that separates right from wrong." A local paper made it appear that this principle (which seems to be best adapted to the meridian of Washington) is Professor Humphreys's golden rule for his own guidance. There were grammatic disquisitions by Professors Green, Harry, Tolman, and others. There were papers on Greek metrics, by Professor Miller on "Hephaestion and the Resolution of the Greek Comic Trimeter," and by Professor Magoun, who discussed with dissent the question, "Is the Present Theory of Greek Elision Sound?" And there were other metric discussions, which, nevertheless, here "versu dicere non est."

Of more literary character was the annual address of the President, Prof. Charles Forster Smith, on "Character-drawing in Thucydides," a criticism and eulogy of the literary methods of that historian. With this may be mentioned Professor Perrin's genial discussion of "The Fiscal Joke of Pericles," the joke being a little item "for necessary expenses" which Pericles included in his war accounts, and which the Grand Old Party of those days passed with a wink and a chuckle. Both believed in moral suasion.

The Romans came next, Professors Rolfe, Wilson, Earle, F. G. Moore, Fitz-Hugh, Steele, Gudeman, and others, discussing points in Plautus and Horace, manuscripts of Juvenal and Virgil, ellipsis in Tacitus, the gerund and gerundive in Livy, Quintilian's criticisms of Terence, Cicero's appreciation of Greek art, and other things. Latin prosody had its hearing in thoughtful papers by Professors Goodell and Radford, and Dr. Edmiston; and the order of words in Latin was treated by Dr. Meader. It is worthy of note that all these Latin men speak Latin in the Roman fashion. The "English system" of pronouncing Latin in American colleges is dead

Archæology appeared chiefly at the evening session of Wednesday, July 8, in Osborn Hall, where a stage and a screen and lantern-slides gave prominence to Professor Richardson's exhibit of "A Head of an Ephebos from Corinth" and Dr. Tonks's report on "Three Terra-cotta Heads." Professor Richardson came fresh from his Corinthian sports with the spade, and showed the homekeeping members, who are perhaps too much inclined, or constrained, to research with the pen and the statistical digits, how profitable it is to dig.

Sanskrit was represented by Professor Hopkins in a paper on "The Ablative of Time in Sanskrit" (read by title), and by Mr. Michelson in a paper "On some Verb-forms in the Rāmāyana." Professor Hopkins, in another paper, on "Rousselot's Phonetic Synthesis," made mention of Avestan; and Professor Jackson, again re-

turned from Persia, represented that ancient language by his genial presence.

There were three papers on English. One was by Professor March, in the form of a report of the committee on spelling reform, of which he has been the chairman for many years. He reviewed the present state of that educational movement, and then spoke especially of recent action by the National Educational Association and other bodies in the introduction of amended forms of words in their own publications. He intimated an expectation that a further step in advance, in the form of a discriminated use of the present double forms of *a*, *o*, and *u*, would be adopted in certain scientific publications. He referred to the fact that precisely the same kind of discrimination was undertaken by a few scholars about the year 1600, and was universally accepted in the next generation, in respect to *i* and *j* and *u* and *v*. In 1600 these pairs were used with no difference of value; about 1635 they were differentiated as now. The other English papers were by Dr. Scott. One was on "Assumed Singulars" (second paper), recording and discussing singular forms like *gramp* for *grampus*, *porpy* for *porpoise*, etc. (some eighty cases), and including an extraordinary tale about *bogy*, with "the only genuine" etymology of *bogus*. The other paper, the fourth and last of a series on "Attraction in English," was read by title and in brief abstract. A new field was opened by the same writer, in his systematic paper on "West Indian Words in East Indian Languages." In this paper the names of many tropical American fruits and other products which have migrated to the Eastern archipelagos were located first in the dictionaries of the West Indian, Mexican and South American dialects, and then traced to their places in Malayan, Philippine and Indian dialects into which they have penetrated. Among these words are *acaju* (*caju, cashew*), *anana, anona, batata, cacao, chilli, chocolate, guava, petate, tiangui, tobacco*. There are many more, some of which have long been left suspended between east and west. So much—too little if too much—for the papers.

Some innovations of procedure were initiated. A permanent committee on nominations was appointed, consisting of five members, one to retire each year. A proposal to alter the mode of publication of the papers, and to issue them separately, was referred to the Executive Committee, with power. The proposal which has been some years in the air, and which was this year the subject of a postal-card vote, to hold the annual meeting in the winter, in "Convocation Week," with other societies in the same city, was discussed and at length rejected. Those who opposed the proposal thought that in a general convocation, at the Christmas holidays, the members' minds would be distracted, and scientific zeal would be lost in social pleasure, while the result of meeting only in a few large cities would be to cut the Association off from actual contact with nearly all the colleges from which it draws its membership.

Two cities contended for the honor of entertaining the Association in 1904—St. Louis, which invites all the world, and Ithaca, the seat of Cornell University. Some preferred St. Louis because of the great Fair; some objected for the same reason. It was decided, by a majority of four, to accept the invitation of Cornell University.

The improved committee on nominations reported, as "the best they could do," the following ticket for the next year, which was elected: President, Professor Hempl; Vice-Presidents, Professors Earle and Merrill; Secretary, Professor Smyth; Executive Committee, the officers named, and Messrs. Bennett, March, Morgan, Perrin, and Scott.

THE DAUPHIN AND HIS KEEPERS.

PARIS, June 29, 1903.

M. G. Lenotre has applied himself with much zeal to the study of the Revolutionary period in France; some of his books have met with great and well-deserved success: 'The Marquis de la Rouerie and the Conspiracy in Brittany,' 'The Norman Chouannerie under the Empire,' 'Tournebut,' etc., etc. He has published an interesting series under the title of 'Vieilles Maisons, Vieux Papiers,' and he has just given us a second series of the same sort under the same title.

The new volume begins with an interesting study of the captivity of the unfortunate Dauphin, the son of Louis XVI. and Marie Antoinette, in the prison of the Temple. The name of Simon, who was the guardian of the Dauphin, has acquired a sort of celebrity; but we really know very little about him. On the 20th of May, 1788, Antoine Simon, a shoemaker, was married to Marie-Jeanne Aladame, a so-called *femme de ménage* (a servant who sleeps outside of the house and who helps for a few hours of the day only). Simon was already fifty-two years old. His life had been a succession of unlucky attempts and failures; M. Lenotre gives us the whole account of his wretched career. His wife (she was his second wife) was not quite as poor as he was himself. The Simons lived in the same quarter as Danton, as Doctor Marat, as Fabre d'Églantine, as the butcher Legendre; as two printers, one of whom became Marshal Brune, and the other Momoro, the husband of the future goddess of Reason; as Chaumette. In the Revolutionary days this quarter lived in a sort of continual delirium. Danton, the popular lawyer, who shook hands with everybody in the quarter, became Minister, and Simon was named Commissary of the Commune. We find him at all the popular demonstrations. His chief patron was Chaumette, who was charged by the Convention to take care of the Dauphin; and Chaumette chose Simon as the guardian of the child. He knew that the wife of Simon was an active woman, and expected, says M. Lenotre, that she would prove to be a good nurse. He held Rousseau's views on education, and thought it right that the child should learn some manual trade. Lenotre does not believe that there was at first any intention of martyrizing the child; Chaumette's idea was to educate the Prince "as a common man," and to give him a nurse capable of taking good care of him and of his health.

The National Archives have the account of the money which was spent for mending Simon's clothes when he entered upon his functions "with a blue coat, *color of the nation*, lined with scarlet red." The woman Simon was also dressed anew. Simon was to have a salary of 6,000 livres, an extraordinary sum for him; and his wife a salary of 4,000 livres. On the 3d of July, 1793, in the evening, the Dauphin, already asleep, was taken away from his mother and given to his two guardians. We can easily understand with what repugnance he looked on those who were to be his constant companions. If we read, in one of the court almanacs of the years preceding the Revolution, the pages concerning the household of the Dauphin, we see none but the greatest names of France. The woman Simon was very different from the ladies who had formed the society of the little Prince.

"What," says M. Lenotre, "seemed to him a sinister prison and a penitential requiem seemed to his keepers the last word of comfort and of high living. They were installed in the second floor of the Tower, in the apartment which had been left vacant since the death of Louis XVI.; they had never known such soft chairs nor eaten so well. The small court of the Temple, with its meagre trees, which seemed to the Simons to be the real country, accustomed as they were to the mephitic smells of the dark courts and alleys of the street of the Cordeliers, must have saddened their prisoner, full of the memories of Versailles, with its infinite perspectives of chestnut trees in flower, and its distant woods joining the blue of the horizon."

This perpetual contrast seems to M. Lenotre to have been the cause of the child's sufferings more than the systematic barbarity of the keepers; he seems to consider the bad treatment of the Dauphin by the Simons as a legend. He tells, however, immediately afterwards an anecdote which proves that the education given to the Dauphin by his keepers had had its worst effect.

"I know an anecdote," he says, "reported by Daujon, an eye-witness, Commissioner of the Commune, an honest man and a rabid republican. Here it is as it was told me. I change only a word, too brutal to be reproduced. 'I was once playing with him,' says Daujon (in an original relation, kept in the collection of autographs of M. Victorien Sardou, the dramatist), 'at a little game of ball. It was after the death of his father, and he was separated from his mother and his aunt. . . . The room where we were was under the apartment of his family, and one heard a great noise as of chairs being dragged overhead. The child said, in a moment of impatience, "Have these women not yet been guillotined?" I would hear no more, and I left the place.' "

The anecdote is horrible, yet M. Lenotre believes it. It is more than I can do. The murderers of Louis XVI. and his family were, some consciously, some unconsciously, desirous to make them appear as uninteresting as possible. M. Lenotre believes that Simon discharged his function only with some reluctance; he was afraid of a political reaction; he was not a Brutus. We see in a note preserved by the Historical Manuscripts Commission, and written by an English agent, living in Paris in 1794, to Lord Granville, that "Simon, who had at first been very useful [to the royal cause], was so afraid of the danger he was incurring that he thought only of leaving his place." What was his danger? Had Simon been bribed by the royalists? Was he really engaged in a royalist plot? What is certain is, that the shoemaker suddenly resigned his post and left the Temple. "This determination," says M. Lenotre, "the causes of which are unknown, is one of the obscure points of this mysterious his-

tory. On the 19th of January, 1794, the Simons presented the child, which had been confided to them, to four Commissioners of the Convention, who gave them a receipt attesting that Simon and his wife had turned over to them "the person of the prisoner Capet, in good health."

The Simons did not return to their lodgings in the Rue des Cordeliers, but established themselves in old stables very near the Tower of the Temple, where already lived some of the servants of the Temple. The Commune had decided that the section commissaries should visit the young Dauphin in turn. Simon never reappeared before him. Was he suspected? If he was, it would mean that he had become an ardent politician; he was a member of the Section Marat, previously "Section des Cordeliers." On the 9th Thermidor he appeared at the Hôtel de Ville as a partisan of Robespierre, was arrested by order of the journalist Fiévée, and guillotined the same day as Robespierre. His wife fell into a state of complete poverty; she had an incurable malady, and was finally admitted to a hospital of Incurables in 1796. She sometimes made allusions to the Dauphin, and often pretended that he was alive and that she had saved him. She did so probably in order to be better treated by her companions in the hospital, who at first looked with horror on the wife of the shoemaker Simon. She would say that "the child is not dead," that "she had contributed to his escape." "Oh! if I had my little Charles, I should not be so unhappy." She liked to make confidences and revelations to the doctors of the hospital, and she succeeded in making herself important enough to receive visits from some exalted royalists after the return of the Bourbons. "Some people," says M. Lenotre, "returned from the visits perturbed and convinced, but with the delightful sort of conviction which is enveloped in doubt, and of which mystery makes the charm." An official inquest was held, and in their report the police officers confirmed the existence at the Incurables of the widow Simon and her identity with the guardian of Louis XVII., adding that "she boasts of having participated in the escape of his Majesty, but she seems not to have the enjoyment of all her reason, and her faculties are impaired." The police finally forbade her to make any more revelations; but she continued to be haunted by the memory of the Dauphin, and once gave the most minute details of the pretended escape. She died on the 10th of June, 1819, and with her "died, perhaps, the secret of one of the most excruciating enigmas of history."

I have spoken at some length of what is to me the most interesting chapter of M. Lenotre's new volume. There is much variety in this work. A curious chapter relates to the famous Fouquier-Tinville, the public prosecutor under the Terror, and his wife. Fouquier-Tinville was an able but unsuccessful lawyer of the worst reputation. He was in such a wretched plight that, after the 20th of August, 1792, seeing the old world falling to ruins and his compatriot Camille Desmoulins made Secretary-General of the Ministry of Justice, he asked for an office, alleging "his capacity for contentious matters." It was a time when there was a great dearth of magistrates; he was named "public prosecutor" to the Revolutionary tribunal, with a salary of 8,000 francs and lodgings in the Palais. His place was no sinecure. The National Archives possess the enormous mass of documents which passed under his eyes; there are as many as six hundred boxes of them. On each document is found the mark of his red pencil. He became the personification of the Terror. When he felt a little tired, he drank brandy with the members of his packed juries, those whom he called the *solides*. Day after day he sent victims to the scaffold; on the 14th Thermidor, while he was drinking a glass of brandy at the bar of the Palais, he heard that his arrest had been decided on; he did not try to run away or hide himself. We have letters which he wrote to his wife from prison. He was fully conscious of his infamy. "I know nobody who would speak in my defence. I could not find in any country an inch of ground where I could lay my head." He was executed on the 6th of May, 1795, with fifteen of the jurors whom he had most compromised. A young woman walked all the time behind the *charrette*, and did not cease to reproach the assassin of her husband. Madame Fouquier-Tinville died only in 1856; she had lived in great retirement. A medal of the Virgin was found among her effects, with a card on which was written with her own hand these words: "He had this medal round his neck when he obtained the condemnation of the Widow Capet."

Correspondence.

DE ARROGANTIA.

To the Editor of The Nation:

Sir: In the 'United States' volume of Lord Acton's Cambridge Modern History series I observe that one Woodrow Wilson refers to "one John Brown," meaning the Man of Harper's Ferry. Can you tell me who Mr. Wilson may be? From his arguing for State rights in the Confederate sense, and from his palliation of slavery, I conclude that he is a Southerner, and that a pedigree of two centuries of man-stealing, woman-flogging, baby-snatching, and lustful and thrifty miscegenation is the possible pinnacle from which he affects to look down on the historic figure, descended from the *Mayflower*, whose soul is marching on. Can you give me any reasons for thinking that Mr. Wilson will be remembered, or will deserve to be remembered, as long as John Brown?

A White Man.

[We cannot answer for the future of the President of Princeton University.—Ed. Nation.]

JEWS AND FILIPINOS.

To the Editor of The Nation:

Sir: That the Government of Russia is strictly within its rights in refusing to receive any remonstrance against the treatment of the Jews is generally conceded by thoughtful men; and the remark has been often made, both here and in Europe, that President Roosevelt would not be disposed to listen to any remonstrance against lynchings or other acts of barbarity within our own borders, if made by Russia or any foreign power. To whom, then, is he bound to listen if acts contrary to humanity are perpetrated? To the remonstrance of his own fellow-citizens.

When the Emperor Alexander the First of Russia visited England in 1814 and attended a debate in Parliament, he expressed the opinion that the Opposition was a very valuable part of the English Constitution; but he thought it would be much better if its leaders would deliver their criticisms and remonstrances to the Ministers in private, instead of bringing them in public before Parliament and the nation. It was generally thought that the remark showed a truly Muscovite ignorance of free institutions in general and those of England in particular.

But at this hour in the United States to whom do the elected rulers of the people listen when they are urged to act with candor and justice by every mode of private, public and Congressional appeal? The Government of the United States has now held military occupation, for a period equal to a full Presidential term, of the Philippine Islands. There is every species of evidence, beginning with the reports of its own officers and agents, and going through an endless line of testimony, native and American, military and civilian, that soldiers and officers in the employ of the United States have perpetrated on the natives torture and suffering totally alien to the avowed theories of modern warfare, and miserably excused by the retort that the Filipinos did worse by us. The President, his Cabinet, and Congress have been appealed to, by every means, public and private, to investigate, to report, and, if need be, to punish. No general or effective investigations have been made, no open and complete report has been rendered, the responsibility for such barbarities as could not be denied has been allowed to waver from private to subaltern and from subaltern to commander, and no effective punishment has ever been rendered for actions which are a stain on our flag.

Let the wrongs of the Jews be left to Russia; let the lynchings be dealt with by the respective States; and let the President and his Cabinet awake at last to the uninvestigated, unreported, unpunished wrongs which his fellow-citizens know, if he does not, have been perpetrated on a "feeble folk" by those who came as deliverers and remain as despots. T.

REPUBLICANISM AND THE SO-CALLED RACE PROBLEM.

To the Editor of The Nation:

Respected Friend: In view of the favor with which various propositions, to repeal, suspend, or circumvent the Fourteenth and Fifteenth amendments have been received in all parts of the country, it seems high time to ask the people of the United States to calmly reconsider the first principles of republicanism. It is safe to say that no other part of the Constitution is more essential to the perpetuation of republicanism than these two amendments. It is unfortunate that they are associated in the public mind with the unwise reconstruction policy which was imposed on the South for a short time after the civil war. The connection between them and that policy was apparent rather than real; and it is a great mistake to charge the deplorable results of that ill-

considered experiment to these additions to the Constitution. Whatever may have been the intention of those who drafted these amendments, an examination of their context will show that they may be enforced to the letter without working injustice to any man or any community. They do not prohibit any State from punishing all its criminals. They only prohibit the States from permitting prejudice and injustice to dominate the enactment and administration of the laws. They prevent no State from prescribing the qualifications of its own voters, except that the right to vote "shall not be denied . . . on account of race, color, or previous condition of servitude"; and the Fourteenth Amendment provides that "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws." It seems as though these provisions must constitute the kernel of the alleged grievance; yet the only objection that can be urged against them is that they place all citizens on an equality in the eye of the law.

It is said that so large a proportion of the blacks are illiterate and criminally inclined that it is necessary to restrain them as a class in order to keep them from encroaching on the rights of the whites as a class; and it appears that the objection to the amendments is that they prohibit any restriction of the blacks that does not apply with equal force to the whites. In order to understand the full significance of this popular desire to segregate the negroes into a class by themselves, and to legislate for them as a "race problem," it is necessary to remember that justice deals with the individual, and cannot deal with the race except through the individuals that constitute it, and therefore can take no cognizance of race statistics. It follows that a "race problem," in regard to the treatment of its own citizens by the nation, cannot exist within the realm of justice. Under a system of government that is founded on justice, each man must be justified or condemned according to his own actions, and not according to his race; and a proper recognition of this fundamental principle of justice and of republicanism practically eliminates our present so-called "race problem" from the field of profitable discussion. It is palpably an outrage to deal out less than justice to a black man because a certain percentage of black men are criminals. A black man cannot be justly held responsible for the shortcomings of other black men, let the percentage of black criminals be what it may; and it is equally unjust to refuse to recognize the capacity of a black man because there are other black men less capable.

Assuming that it is true that the negroes as a race have less intellectual capacity and less basis for improvement than the whites as a race, that fact cannot militate against them either in the administration of justice or in regard to their legal rights as citizens. It is no province of the State to grade and classify its citizens, and deal out privileges to them, according to their intellectual capacities. Under a pure administration of justice, it is the lack of virtue alone that can place a citizen at a disadvantage in the eye of the law. The presence of a great number of criminals is undoubtedly a misfortune to the community in which they reside; but justice does not increase the punishment of a criminal because of his ignorance or of his lack of moral training, and to increase it on account of his race or of the color of his skin would, if possible, be a greater outrage. Even if there were a thousand negro criminals to one white criminal, that fact could make no difference in the administration of justice to each individual criminal, and certainly it could make no difference in the administration of justice to negroes who are not criminals at all. It follows that it would furnish no valid excuse for special treatment of the negroes as a race, or as a "race problem."

The contention—a contention with most respectable and influential sponsors at the present time—that only a comparatively small number of the white citizens of the United States are sufficiently acquainted with negro character to deal intelligently with the "race problem," is but a specious plea for the coveted privilege of dealing with the negroes as an inferior race. An acquaintance with justice, and with the principle of human equality in respect to the right to "life, liberty, and the pursuit of happiness," is of far more importance than mere contactual acquaintance with the negro. It is enough to know that the negroes are human beings; that they have been close followers of the white man's example, and subjects of his compulsory guidance, for many generations, and that they must now live among us either as freemen under the full protection of the Constitution and the laws, or as servile suppliants for the white man's favor. Human nature is the same everywhere, and everywhere gives substantially the same response to brotherly kindness and encouragement, or to superciliousness and contemptuous depreciation, as the case may be. There is no essential difference between lust in the negro and lust in the white man, and covetousness is still covetousness in the one as in the other. Even if there are ten times as many lustful negroes as there are lustful white men, that fact creates no "race problem," because each individual is responsible only for his own sin, and no man can be justly treated as a sinner until he commits an overt act of sin. The only antidote for lust is self-restrained manhood; and the only method by which this antidote can be effectively applied is practically uniform throughout the world, regardless of race or condition. Surely, if ten righteous men were sufficient to have saved Sodom from destruction, the many thousands of righteous colored people in the United States should be sufficient to save the American negroes from being all stuffed together in a common matrix and treated as a "race problem." They have a right to be treated as responsible human beings—as men with a germ of the Christian religion in each of their souls. Even if there were no question of Constitutional law or of republicanism involved in the case, it should be obvious to every one that the treatment of the millions of colored people in the United States cannot be safely consigned to those who openly avow their belief that the negro is a menace to the welfare of the State except in the position of a fawning parasite. I do not mean to say that this is the belief of nearly all the white people of any section of the United States, but the favor with which the propositions to permit the whites of certain sections to legislate for the colored people as an inferior race are being received in all parts of the country, certainly does not prove that the negroes can be safely deprived of the full and unspecialized protection of Constitutional law in those sections where the prejudice against the political equality of the races is the greatest.

It were well if it could be recognized, once and for all, that there is no middle ground—no debatable land—between republicanism and a state of servitude or vassalage. Of course there are different degrees of vassalage, but the least degree is outside the bounds of republicanism. And when certain States of the Union demand the privilege of putting their negro citizens in a straitjacket and under leading-strings to the whites, it should be clearly understood that they are demanding the privilege of destroying republicanism. Republicanism consists in the equal representation of all citizens in the making of the laws, and in the uniform treatment of all citizens in the administration of the laws. To discriminate against a class of citizens in either respect is to destroy republicanism, at least so far as that class of citizens is concerned. It necessarily places a class of citizens in subjection to another class of citizens. It makes a class of freemen and a class of vassals; and at best the government becomes as a house which is divided against itself—republicanism on one side and despotism on the other. Hence "a white man's republic" spells negro bondage.

I do not deny that under certain abnormal conditions it may be expedient to so limit the right of suffrage as to exclude dense ignorance, but this must be done without discouraging any citizens from qualifying themselves, and without making it more difficult for some to qualify themselves than others. When it is thus possible for every man to qualify himself if he sees fit, all are still substantially on an equality in the eye of the law. But even this vitiates the purity of republicanism, and is permissible only as a temporary makeshift, or as the least of two portentous evils. In fact, the need of such an expedient is not so much because of the mass of ignorance as because the more intelligent part of the population have wofully neglected to gain the confidence of the ignorant by unselfish and enlightened leadership. It is the natural province of intelligence to guide ignorance, and the only possible basis for such guidance is mutual regard, with well-grounded confidence on the one side and untiring patience and self-sacrificing friendship on the other. And the selfish renunciation of this primary duty on the part of intelligence is infinitely more of a menace to the general welfare of the community than the full enfranchisement of the mass of ignorance itself. But, whatever may be the danger from enfranchised ignorance, it should not be forgotten that Caucasian ignorance is as dangerous as African ignorance; and to disqualify in any degree a large class of citizens "on account of race, color, or previous condition of servitude," is to strike at the very root of republicanism. Moreover, if there is no desire to discrim-

inate against the negroes on these accounts, of what significance is the popular contention that the black race is inferior and subservient to the white race by natural law and divine ordination? There has recently been a strenuous revival of this theory, which was scarcely more in vogue or more popular fifty years ago, in the days of slavery, than it is to-day. The present talk about the "superior race" and the "inferior race" means master and vassal if it means anything at all. If the so-called "superior race" once assumes the right to treat the other as inferior in any degree, there is nothing to hinder it from assuming the right to treat it as inferior in every degree. To infringe on the principle of equality under the law in the least degree is to destroy it totally. To say that the "superior race" will use superior political power with wisdom and justice, is to say that a master will treat his slave with wisdom and justice. We have a bare promise, which, as the history of the world proves, is made to be broken or kept according to the temper, the interests, and the exigencies of the master.

Let there be a cordial, unprejudiced recognition and encouragement of self-restrained manhood, without regard to race; and let all ignorance be treated impartially, regardless of whether it is white, black, brown, or yellow; and let all criminals be treated according to the crime and the law, and the "race problem" may be safely left to solve itself. It should be remembered that the colored people are here, natives of the country, with as good a right to a living as any of the rest of us. We can keep the Chinese from coming into the country, and all other foreigners also, if we see fit; but our colored people are already with us, and with us to stay and to increase in numbers, and it is the duty as well as the interest of all to build up their self-respect and manhood. A man develops his self-respect and manhood under difficulties when he is constantly being told that he belongs to an inferior race, that he is merely a small piece of a disreputable "race problem" which the white man has in to soak; that the nation is disgraced by having him break bread at the same table with a white man, and that it is his duty to go through life with his hat in his hand, ready to wipe the earth with his forehead as an acknowledgment of his inferiority before every white man that he happens to meet on the highway. A "race problem" in regard to our own citizens is a gratuitous incumbrance—a superfluous issue—which cannot be entertained as a basis for legislation and government without making a mockery of justice and disintegrating republicanism.

No one should need to be told that the question of political equality is entirely distinct from the question of social commingling. The first is a matter of inexorable principle and justice; the latter of personal taste and congeniality.

ISAAC W. GRISCOM.

A CASE OF "LIFTING."

TO THE EDITOR OF THE NATION:

SIR: Will you kindly inform your readers that the account of the admission of Franklin to the degree of LL.D. at Oxford in 1762, which appeared over the signature "D." in the *Nation* for June 25, was copied entirely from a work by me entitled 'Historic Side-Lights,' and published by Harper & Brothers in 1899? If so, you will much oblige,

Yours respectfully,

HOWARD PAYSON ARNOLD.

PASADENA, CAL., July 14, 1903.

[We regret very much to have been imposed upon by a person privately signing himself "Nelson Weld." At the same time we are pleased not to have had falsehood palmed off on us, and to have given wider currency to Mr. Arnold's laudable researches.—ED. NATION.]

THE ETHICS OF BOOK-MAKING.

TO THE EDITOR OF THE NATION:

SIR: Mr. Ranck's apparently correct explanation (at p. 50 of your current number) of the reason why the volume of maps in the Supplement to the Encyclopædia Britannica is taller than the other volumes, only increases the doubtfulness of the ethics of the case by making it appear that we, for instance, have unwittingly bought the same atlas twice, while being supplied with two ostensibly independent encyclopædias. (There are slight differences between the maps in the Century Atlas and the Encyclopædia Britannica volume, but they are very slight, and the maps are certainly, as Mr. Ranck says, "the same.")

If librarians and other buyers are shy of subscription books, is it not largely because their publishers plainly say, "Beware of our tricks and manners"? 'Tis indeed a pity that we should be taught this of so reputable a firm as that responsible for the Encyclopædia Britannica.

W. I. FLETCHER.

AMHERST COLLEGE LIBRARY,
July 17, 1903.

Notes.

The Outlook Company are preparing to publish 'The New American Navy,' in two volumes, by John D. Long, ex-Secretary of the Navy; the 'Story of a Labor Agitator,' by Joseph R. Buchanan; 'Tolstoy the Man,' by Professor Steiner of Grinnell College; 'The Forest,' by Stewart Edward White; a 'Book of Trees,' by J. Horace McFarland; 'Backgrounds of Literature,' by Hamilton W. Mabie.

'Wild Fruits of the Countryside,' by Prof. F. E. Hulme, the initial volume in the illustrated "Woburn Library of Natural History," edited by the Duke of Bedford, will be published in this country by the New Amsterdam Book Company.

In default of a school of journalism, aspirants may look forward to a "thoroughly bright and readable" 'International Encyclopædia of Journalism' projected by William Hill (of the *Westminster Gazette*), Alfred Harmsworth (of the *Daily Mail*), and Maurice Ernst (of the *Neues Wiener Tagblatt*), and "to be published at a popular price, probably in two handy volumes on good thin paper." Its aim is historical for the rise and development of journalism, and practical upon all points affecting editing, publishing, ownership, general management and administration, processes of typesetting, the law of libel, and much more. The Secretary's address is Granville House, Arundel Street, Strand, London, W. C.

'Modern Civic Art,' by Charles Mulford Robinson (Putnams), relates to the planning and beautifying of cities. Its style is rather too eloquent—not to say grandiloquent—but its suggestions are almost uniformly sensible, and the examples cited are to the point. It should furnish ammunition to our various Municipal Art Societies and Art Commissions, but we could wish it a trifle quieter, while its usefulness would be greatly enhanced by illustration.

Prof. Harold N. Fowler has prepared a 'History of Roman Literature' for the Appleton series of "Twentieth Century Textbooks." It covers the field briefly from the earliest period down to the more important writers of the fourth and fifth centuries, and gives a well-selected bibliography as a guide for more extended study. The obvious criticism of the book, with relation to the pupil's highest interest, is that the attempt to supply a large store of information within the space limits allowed has been fatal to any adequate appreciation of the work of the really important authors.

Mr. Edwin M. Bacon's practised hand has been invoked once more to direct the stranger in the New England metropolis. For the late convention of the National Educational Association he prepared 'Boston: A Guide Book' (Boston: Ginn & Co.), very deftly put together and typographically elegant, subject to the drawback of fine type and the glazed paper demanded by the illustrations. These are numerous and well chosen, and equally commendable are the maps.

'The Poultry Book,' Parts I., II., by Harrison Weir, F.R.H.S., edited for this country by Willis Grant Johnson and George O. Brown (Doubleday, Page & Co.), is merely introductory to a work to be completed in eighteen parts. Harrison Weir, one of England's most noted animal draughtsmen, is also a recognized authority in the rearing and breeding of domestic fowl. The intention is to give the results of his fifty years' incubation on the subject. The American editors will devote their attention to our methods of breeding domestic fowl. These differ considerably from those pursued in England. As might be expected from Mr. Weir's skill as a draughtsman, the illustrations are of a high order of merit and accuracy. It is interesting to contrast his drawings with the American illustrations — process reproductions of photographs from life. Neither suffers by comparison. Part II. is a monograph on eggs by Miller Purvis of Illinois. They are considered from every standpoint. More attention might have been given, with advantage, to their infertility; for this is a subject which deeply concerns the chicken-raiser with incubators. The fertility of an egg cannot be established with approximate certainty until the fifth day of incubation. Even then apparently fertile eggs are subject to vicissitudes fatal to the production of vigorous chicks. The first loss through unfertile eggs is on an average about thirty-three and one-third per cent. Subsequent accidents increase this, so that only about half the eggs placed in incubators produce chicks which survive to reach maturity.

The 'Catalogo Generale della Libreria

Italiana (1847-1899)' (Milan: Hoepli; New York: Lemcke & Buechner) disposes of the letter L and makes a good stride in M in the two latest instalments. Among native writers some of the more prolific are Lombroso, Luigi Luzzatti, T. Mamiani, Paolo Mantegazza; and one is pleased to see a little group of the surname Marconi, writing upon education, agriculture, physics, medicine, and social reform. Editions of Machiavelli have been continuous from 1849 to 1899 (when the 'Discourse on the Tenth Decade of Livy' was edited for schools). 'The Prince' likewise has been frequently reprinted in the same period. Alessandro Manzoni fills two solid pages, with 'I Promessi Sposi' to the fore. Dr. Livingstone's works (to turn now to translations adventured in the peninsula) were called for in their time; Capt. Marryat's 'Snarleyyow' alone of all his novels has been taken over. Macaulay's Clive, Machiavelli, and History of England were appropriated, and his 'Lays of Ancient Rome' were essayed in 1869-72. Cardinal Manning, with half a column, outranks any of his compatriots in this particular section of the Catalogue, and shares with Longfellow the distinction of English-writing primacy in the Italian translation market. From 1866 to 1896 our poet's "Evangeline" (above all), his "Excelsior," "Wreck of the *Hesperus*," "Spanish Student," and "Miles Standish" have experienced many editions. It appears strange that nothing of Lowell's work has been attempted in Italian—a tribute, perhaps, to its American stamp. The inclusion of one of President Mahan's theological writings serves to emphasize Lowell's entire absence.

The Universal Technical Lexicon, 'Allgemeines Technisches Wörterbuch,' which the Society of German Engineers decided in the spring of 1901 to prepare and to issue in three languages—German, English, and French—is securing the enthusiastic support of the whole technical world. No fewer than 341 societies—namely, 271 German, 42 English and American, and 27 French—have undertaken to furnish systematic contributions to the work; and, according to the recent report of the general editor, Dr. Hubert Jansen, in Berlin, a million and a half of definition slips have been received with no further solicitation than the original request for collaboration published when the new enterprise was undertaken. It is noteworthy that no fewer than 2,185 business firms have promised their aid in gathering the necessary material. It is not proposed to print the work, which promises to be thorough and exhaustive, until 1905.

As a pendant to the Abbé Migne's famous 'Patrologiæ Cursus,' Latin and Greek, Dr. J. B. Chabot of Paris has begun the publication of a 'Corpus Scriptorum Christianorum Orientalium.' The editor himself has taken the Syriac texts in hand. In order not to come into conflict with any other series, the new Corpus will, for the present at least, publish only inedited texts, the departments to be covered including Exegesis, Liturgics, Ecclesiastical Jurisprudence, Dogmatics, Philosophy, History, and Hagiography. Each work is to be accompanied by a short introduction and notes. The Paris Imprimerie Nationale does the printing, and the cost of a sheet of Oriental text is to be one franc, and of the translated text half a franc. The undertaking is entirely one of Catholic scholars, and the list of contributors is international in character. It is the largest literary venture of the kind undertaken by Catholic savants for decades.

Numbers 2 and 3 of the *Burlington Magazine*, for April and May (London: Savile Publishing Co.; New York: Samuel Buckley & Co.), taken together, give a pretty complete idea of the scope and policy of the publication, which has nothing "popular" about it, and is distinctly, as its title states, "for connoisseurs." The superb quality of its reproductions and the seriousness of its text distinguish it from all other English art magazines, while it differs from Continental publications by the absence of any reference to the art of to-day. The editor, indeed, disclaims the intention of ignoring contemporary art, but so far nothing more recent than some of Rossetti's drawings of Miss Siddal, of about 1854, has been admitted. In another respect the scope of the magazine is broad enough, it having already included articles on Oriental carpets, English silverplate, and even tinder boxes, as well as on sculpture, painting, and engraving. The *Burlington Gazette* is published each month as a supplement to the *Magazine*, and contains accounts of sales, general art news and notes, etc., together with a "Bureau for Advice and Opinions" and Answers to Correspondents. The fine plates of newly discovered or little-known works of art will ensure the interest of artists; but the work as a whole is for the collector, to whom it should prove indispensable.

Prof. Friedrich Delitzsch, who spent the time from March to October, 1902, in a personal examination of the work done by the German Orientgesellschaft in Babylon, with Dr. Koldewey as manager, has given this society, of which the Emperor is an enthusiastic member and a liberal contributor, and of which Delitzsch is the President, a detailed account of what he saw and learned. His address, originally delivered in the presence of their majesties in Berlin, has been published. Noticeable is his affirming that in the law of 235 tablets found in the recently begun excavations in Dhara, three days' journey from Babylon, proof is at hand that the cuneiform system of script, a product of the Sumerian civilization, was originally developed out of a pictorial writing. He also announces the discovery of the proclamation of Cyrus issued after the taking of Babylon, from which it appears that Herodotus's version of the capture is incorrect, and that the city fell into the hands of the conqueror by treachery.

The University of Jena has just celebrated the four-hundredth anniversary of the birthday of its founder, the Elector John Frederick of Saxony, by the presentation, on a large scale, of an historical Luther play, written by Fräulein Dietrich, and entitled "Kurfürst Johann Friedrich der Grossmüthige." It is a singular fact that Jena, originally established to be the bulwark of orthodoxy, because even Wittenberg had lapsed from the true Lutheran faith, has now for many decades been the headquarters of advanced and progressive religious and theological thought.

"Economic Plants of Porto Rico" are described by O. F. Cook and G. N. Collins in a recent number of contributions from the United States National Herbarium, published by the National Museum. The list of all the native names of such plants which have been recorded contains references to their scientific names, so far as these have been determined. There is also miscellaneous information on the principal cultivated plants of the island, with notes on many of the minor economic plants. The English names have been included for the benefit of those who are familiar with the flora of other tropical countries. It is well known that the natives of Porto Rico have a longer series of popular names, and use them with more precision, than the inhabitants of other parts of the American tropics. Many species which in Cuba are not distinguished except by botanists, have received separate names in Porto Rico. This may be accounted for by the existence of a large rural population which has preserved names obtained from their Indian ancestors and from the Spanish settlers. In not a few cases these names are unknown outside the island, and are quite different from those used in Mexico and Cuba. The paper is illustrated by numerous half-tones and by figures in the text.

The cultivation of olives and the manufacture of olive-oil in France are the subject most fully treated in the Consular Reports for June, in response to a request for information from California olive-growers. Next in importance is the suggestive account of the German chambers of commerce, 145 in number, the Empire being divided into as many commercial districts. Their duties are to further the commercial and industrial interests of the district, to take the initiative in all promising new enterprises, especially such as relate to transportation, to establish commercial museums and to provide for technical education—one of the prime concerns, a deep interest being taken in the welfare of apprentices, and much being done to elevate their morals and habits. The annual reports are instructive, containing information as to the general state of trade and manufacture in the district, the condition of labor and the relations between the workingman and his employer, the schools, agricultural and food products, etc. Some reports "treat exhaustively the whole subject of the textile industry." Those of Hamburg and Bremen deal with shipping and foreign trade in general, and that of Frankfort-on-the-Main treats of chemicals, drugs, colors, and dyes. They exert a powerful influence on legislation, each chamber being regarded by the Government "as a full legal person, or corporation."

—Volume iv. of 'The Philippine Islands, 1493-1803' (Cleveland: The Arthur H. Clark Co.), covering the years 1576-1582, is at least not second in the amount of interesting material it contains to any of the preceding volumes of this extensive undertaking. This is due chiefly to the letters and documents forwarded by Doctor Francisco de Sande, third Governor-General of the Islands, 1576-1581, to the King of Spain (at that time Philip II). The larger part of the volume deals with the first expeditions undertaken by the Spaniards to subdue the Moros; and it is interesting to compare their accounts with the recent dispatches about our own Captain Pershing's undertakings in the Lake Lanao region. The Spaniards had not yet heard of that lake and its Moro settlements, but the expeditions in 1578 and 1579 to the Moro settlements up the delta of the great

"Mindanao River" (now known as the Rio Grande of Mindanao) at Cotabato were in every way comparable to the recent pioneer work in the Lanao country. We think we can foresee the failure of the Spanish attempts with the Moros, when we read of their going at these people at the very start with pious ejaculations as to the "error of their ways" and of their intention of converting them to the "true religion" (this to Mohammedans, even recent converts!). We find that Sande himself directed the first expedition, that of 1578, against the Moro strongholds of Borneo; had Spain followed up this expedition, especially after succeeding to the Portuguese possessions with the union of the two crowns in 1580, Borneo would doubtless now be one more large addition to the list of our Philippine problems. The Sultanate of Jolo was then, as now, connected with possessions in Borneo; and this expedition resulted in the submission to Spanish sovereignty of the then Sultan of Jolo, formal documentation of which was made the first of a long series of pacts between Spain and the successive Sultans of Jolo. The next year we find the good and careful, but fussy, Doctor Sande enjoining on the Sultan, through his emissary to secure the annual tribute, that he exercise diligence in pushing the business of pearl-fishing!

—Other sidelights on these early days of Spanish rule are shed by the repeated news of conflicts between the civil authorities, and accusations of dishonesty and incompetency made against each other. There are not yet enough friars to bring them into the strifes as bitterly as a little later; and most of those who come are eager to abandon the Philippines at once for the fresher and broader fields for missionary work in China and Japan. Indeed, they left so rapidly that, after Governor-General Sande had refused permission, and one party of friars had left secretly for China, his successor, Governor-General Ronquillo de Penalosa, in 1582 formally issued an ordinance restricting departure from the islands. It is interesting to note that most of the friars who first came to the islands could not say mass or otherwise supersede the secular priests, and that numbers of the latter were at first sent to assume charge of the parishes as formed, the friars being expected to confine themselves to missionary work. Governor-General Sande speaks in 1577 of having to send some of the friars back, and asks that those sent shall be "such as are missed in the places from which they come." He prefers to have the new comers "such as cannot possess property."

—Callaghan & Co., Chicago, have published in three volumes the centenary addresses and proceedings of "Marshall Day," 1901 ('John Marshall: Life, Character, and Judicial Services'). The whole is compiled and edited, with an introduction, by John F. Dillon, and illustrated with portraits and a facsimile letter. The portraits are those of St. Mémin, Sully, and Inman. The centenary was celebrated in some forty States and Territories. From the multitude of addresses and the introduction, the reader gets a very good idea of Marshall's life and character as well as of his judicial work. The latter is, of course, to be judged, as here, mainly by lawyers. It is to the *Federalist*, rather than to the opinions of the Supreme Court, that the ordinary reader goes for early constitutional exposition. Marshall's life, as was pointed out by the late E. J. Phelps, and as the present editor repeats, is still to be written. Perhaps, however, no great man has ever lived as to the main points of whose career there is so little controversy; and as to the soundness of the structure which he made the legal foundation of our system, we believe there is today hardly the trace of a difference of opinion. If the "judicial veto," as Jefferson called it, and to which the Democrats of that day were violently opposed, is today a commonplace of American constitutional law, the fact is by common agreement due to Marshall, and this principle, which places the courts above the Legislature, is the feature of our system most essentially American. His judgments on international law are not so important, but they are of the first rank; of American Constitutional law he may be called the founder. If Marbury vs. Madison had been decided the other way, and Congress left to decide what was and what was not Constitutional, it is impossible to calculate the consequences. As a contribution to the development of Constitutional government, it is difficult to know with what to compare Marshall's decision; in our eyes it is hardly less important than habeas corpus or trial by jury.

—'Home Life under the Stuarts, 1603-1649,' by Elizabeth Godfrey (Dutton), is a book of very considerable attractiveness. Its subjects are well chosen, it is agreeably written, and in point of information it rather more than fulfils the requirements of the general reader. The author modestly observes: "To do the subject justice needs unlimited time, wide acquaintance with the very large and important literature of a great period, and a power of selection and coördination that I cannot lay claim to. It has sometimes seemed to me that I ought to leave it for abler hands, or wait till time should increase and ripen the little store of material I have gathered." Wrested from the book itself, these words may sound perfunctory; but coupled with it, they reveal a consciousness of high standards. The character of the contents may be inferred in part from the following titles, which appear in the table of contents: "The Nursery," "Children's Games," "Public Schools," "The Private Tutor," "The University," "Girlhood," "Giving in Marriage," "Married Life," "The Housewife," "Needlework," "Dress and Fashion," and "Gardens." There are other topics, but we have selected those which are most representative. Miss Godfrey draws her illustrations largely from the correspondence of the time, levying tribute upon the Verney memoirs, the letters of Endymion Porter and Mary Rich, and the account which Mrs. Hutchinson has left of her beloved husband. Though the greater part of the material comes from Cavalier sources, the Puritans are treated with fairness, and no disposition is shown to neglect the milder aspects of their family life.

—The Arnamagnæan Commission has, under the title of 'Palæographic Atlas, Danish Section,' just sent out, through the Gyldendalske Boghandel in Copenhagen, a portfolio containing in 38 folio plates collotype reproductions of sample pages of 64 mediæval Danish manuscripts and documents. This publication, whose editor is the learned librarian of the Arnamagnæan collection of manuscripts in the Copenhagen University Library, Dr. Kr. Kaalund, will prove of the greatest value to all students interested in Danish mediæval literature, not to say in mediæval literature generally. Such a publication has hitherto been lacking in Danish literature. The more or less imperfect facsimiles of sample pages that have accompanied earlier editions of old Danish manuscripts by no means rendered a publication like the present one superfluous. It draws from the most important manuscripts of Danish mediæval literature, written some in Danish and some in Latin, chronologically arranged, so that the student, besides having in the plates the means of forming an independent judgment of the date of the several manuscripts, has an opportunity of studying at first hand the development of the Danish language during those three hundred years in which was laid the foundation of the present Danish literary language, as well as of following the development of Danish chirography. Among the more interesting manuscripts here reproduced may be mentioned the several Danish Provincial Laws (those of Scania, Jutland, and Zealand), the Angers Fragment of Saxo Grammaticus, mediæval handbooks of medicine, Mandeville's Travels, Lucidarius, etc. Opposite each phototype is set a description of the several manuscripts and a diplomatic rendering of the text, each different hand in the original being shown in a different style of type. Of the scientific value of these parts of the work the editor's name is a sufficient guarantee. The methods followed in this publication are generally those employed in the several series published by the English Palæographical Society, and the entire publication, to which will shortly be added an Old-Norse-Icelandic Section, is very creditable to the editor as well as to the Arnamagnæan Commissioners and the firms responsible for the mechanical part of the work.

—For the past thirty years, efforts have been made to improve the situation in Denmark with regard to family names. When, by an ordinance of 1828, the use of shifting patronymics was prohibited, a large proportion of the peasantry kept the patronymics of that generation; hence the immense number of Danish Hansens, Petersens, etc. It is estimated by the editor of the Copenhagen Directory, in an article published in a recent number of the *Berlingske Tidende*, that the 3,200 entries of the practically meaningless name Hansen represent no fewer than 30,000 Copenhageners who bear it. Several other -sen names press the Hansens closely. The first scientific attempt to effect relief was given in a pamphlet published in 1899 by a commission appointed by the Ministry of Justice. In this report, prepared by several eminent specialists, a full account of the development of Danish family names is given, with special reference to the present situation. This has now been supplemented by a list of 1,600 Danish family names no longer in use, compiled by Verner Dahlerup and Johannes Steenstrup. In order to encourage the substitution of these good old Danish names for the objection-

able patronymics, the Ministry of Justice has substantially reduced the registration charges, and the Genealogical Institute offers its services to discontented Hansens and Petersens at a correspondingly low rate. A similar crusade against patronymics is being conducted in Norway and by the Norwegian press in this country, the aim being to restore the old farm names, very few of which are now in use. It may be noted in this connection that the father of Björnstjerne Björnson was originally named Ske, from the farm on which he was born, and that he did not change it for the now famous patronymic until a few years before his marriage. Rasmus B. Anderson frequently uses his family name of Kvelve as a journalistic pseudonym.

—There are few historical events of the first rank which are involved in such obscurity as the Persian and Arab conquest of Egypt and even the whole period of the reign of Heraclius and his immediate successors. Especially the Muslim raid into Egypt and what followed it has lain hitherto in the most absolute uncertainty as to chronology, sequence, causes and end. This has been due to the contradictory and fragmentary character of the sources; the Greek chroniclers apparently did not know, and the Arabs did not care, how the matter had exactly gone. But the Egyptian Church did know and care, and now from its records, scanty as they are, in Coptic and Ethiopic, light is beginning to break. These scattered rays are skilfully brought together by Dr. A. J. Butler in his 'Arab Conquest of Egypt and the last Thirty Years of the Roman Dominion' (Oxford: Clarendon Press; New York; H. Frowde). Chronologically, Dr. Butler's period runs from the revolt of Heraclius in 609 to the death of Amr in 664. In events it takes account of that revolt, and of the importance of Egypt to it, of the Persian conquest of Syria and Egypt, of Heraclius's magnificent crusade against Persia, of the rise of Muhammad and the strange collapse of the so recently conquering Roman power, and of the Arab invasion and conquest of Egypt in detail. The two great figures in it are Heraclius and Amr, the one as conqueror and failure, the other as the founder of the Arab power in Africa. Another thread held firmly by Dr. Butler to the great advantage of his book is the ecclesiastical. Few are so well qualified as he to divide with safety the different sects and to trace their political affinities and discords. He can estimate, for example, the full weight of the error of Heraclius in attempting to compel ecclesiastical unity throughout the whole Empire. And so his history may also be said to be built round the long patriarchate of Benjamin, who was Jacobite Archbishop of Alexandria for thirty-nine years until his death in 662, and thus lived through the whole tragedy. On this side, too, lies Dr. Butler's most outstanding single contribution in his identification of the mysterious al-Muqawqis with Cyrus, the Melkite Archbishop of Alexandria, and the evil genius and riddle of the time. This identification, especially on the evidence of Severus of Ushmunain, must be regarded as complete, and the further explanation of the word "Muqawqis" approaches certainty. The silence or contradictions of the Arabic historians can have no weight against the Coptic evidence; on this point, as throughout, they were hopelessly in the dark.

THE BEGINNINGS OF A STATESMAN.

Life in a New England Town: 1787, 1788. Diary of John Quincy Adams while a Student in the Office of Theophilus Parsons at Newburyport [Mass.]. Boston: Little, Brown & Co. 1903.

We take leave to think that, in the matter of twin titles, this book puts the cart before the horse. Mr. Charles Francis Adams's prefatory excuse for publishing the present fragment of his great ancestor's Diary is that it gives a "graphic picture of social, everyday existence" in one of the most flourishing seaports of New England. Graphic we should hardly call it. His grandfather's descriptive faculty was among the least conspicuous of his admirable traits. The diarist nowhere undertakes to picture the general aspect of the town to which he came a perfect stranger, and, except for an occasional allusion, as to the "river" being "fast" in cold weather, his chronicle is as devoid of local color as could well be. We believe the Merrimack is not named in these pages, nor any street. How different this from President Dwight's portrayal and encomium of Newburyport less than ten years later; how like the young Adams's entry, on visiting Exeter, N. H., of his satisfaction with "the novelty of the town, which I never saw before"—and there an end. Both Providence and Newport, as stages on his way to New York, elicit more particular observation than Newburyport.

Part of the law student's satisfaction at Exeter consisted in having sleighed there "with an amiable girl"; and nothing is more striking than his occupation at this period with "the proper study of mankind," quite apart from its setting in nature. Not on familiar terms with a single household, as he records, he discharged his social duties with great assiduity. But what interests us is not the diversions in vogue, the musical entertainments, the rides, but John Quincy Adams in it all; here overdrinking with the men, there dancing or playing kissing games with the girls, and perambulating the streets with his flute, serenading till driven in by the rain. Why this interests us is because, Adams being an historic personage second to few others in American annals, we insensibly carry his mature repute into this diary. But then he was always mature. We are reading of the doings, observations, and reflections of a youth fresh from Harvard at the age of twenty; yet at scarcely any point on the intellectual side do they remind us of the graduate of to-day. How many of these would, after a day's gunning with no sport, hold such a colloquy with themselves as this?

"Game laws are said to be directly opposed to the liberties of the subject: I am well persuaded that they may be carried too far, and that they really are in most parts of Europe. But it is equally certain that where there are none, there never is any game; so that the difference between the country where laws of this kind exist and that where they are unknown, must be that in the former very few individuals will enjoy the privilege of hunting and eating venison, and in the latter this privilege will be enjoy'd by nobody."

Let forty-eight years elapse, and compare with the foregoing the following extract from the ex-President's diary (August 12, 1835):

"Mr. Abbott Lawrence told me that they were going to have a very great meeting at Boston to put down the anti-slavery abolitionists; but he said there was no diversity of opinion upon that subject here. That, I think, will depend upon the measures to be proposed. If the measures are vaporing resolutions, they will pass unanimously and be inefficient. If the measures are efficient, there will be diversity of opinion."

Plainly, the child is here the father of the man. But not yet is the *anti-slavery* paternity manifest. The Harvard bachelor was so much opposed to the pending adoption of the Federal Constitution as to incur the reproach of "anti-federalist." He said truly that, "if the Constitution be adopted, it will be a grand point gained in favor of the aristocratic party"; but the context shows that he had not in mind the slaveholding aristocracy, against whose intrenchment in the Constitution he afterwards inveighed in his Bridgewater address (1844)—"the exaction, fatal to the principles of popular representation, of a representation for slaves—for articles of merchandise, under the name of persons." The youth makes no allusion to the proslavery compromises. He hears at Exeter, in the New Hampshire State Convention for ratifying the Constitution, the argument of Joshua Atherton, the leader of the opposition, who, "in a speech of more than an hour, recapitulated every objection that he could invent against the Constitution." Adams was now "converted but not convinced" in favor of acceptance, but he ridicules the speech as of "a miserable speaker and a worse reasoner." Nevertheless, we know that one of Atherton's titles to distinction is his having raised anti-slavery objections to the new instrument, and that he supported them in what some considered terms of pathos and eloquence, though perhaps on another occasion, as the Convention was adjourned. The curious juxtaposition was Adams in the audience listening despitefully to the grandfather of Charles G. Atherton, afterwards Representative in Congress and author of the "Gag Law" bearing his name directed against his then fellow-Representative, John Quincy Adams, the introducer of anti-slavery petitions. Only at Harvard's "exhibition" in 1788 was the returning graduate struck with Benjamin Abbot's "English Oration upon the Slave Trade [just limited in the new Constitution]." "I do not recollect," he says, "having heard any performances upon this subject at college, and it will afford a fruitful source for declamation." The next year he notes, without moralizing, that Newport's "former prosperity was chiefly owing to its extensive employment in the African slave-trade, of which some remnants still continue to support it."

Jefferson's 'Notes on Virginia,' half read before he went down to Newburyport, extort Adams's admiration for their learning and philosophy; but it is in the second half that the classic condemnation of slavery occurs. If ever reached in the two years of this diary, it elicited no comment. Adams's other reading, apart from his law books, did not differ greatly from what our present-day collegians might be found engaged in. But it is notable that the first book he took up in his new home was 'Tom Jones,' acutely characterized as "one of the best

novels in the language. The scenes are not only such as may have taken place, but they are similar to such as almost every person may have witnessed. This book cannot lead a person to form too favorable an opinion of human nature; but neither will it give a false one." A month later we find him "at home all the evening, reading Rousseau's Confessions. This is the most extraordinary book I ever read in my life." These are some of the unmistakable signs of young manhood, and the fair sex are very much in evidence in this diary. Following a propensity which Adams exhibited on graduating in writing a "character" for perhaps every member of his class (the footnotes contain specimens), he seldom fails to try his hand on the women of his acquaintance, having the idea that "it requires a much longer acquaintance to form a just opinion of the character of a man than of a woman; the distinguishing traits are deeper and much more numerous." It cannot be maintained, we think, that the Characters are brilliant or lifelike, being exercises rather than visualizations; but they testify along with so much else to the writer's maturity, and were confessedly penned with a view to enlivening the diary with some variety. "The day was spent in the usual uninteresting manner. Indeed, it may be generally observed that the more advantageously the day is employed for myself, the less I have to say at the close of it." This it was, together with ill health, that made him vote the diary a bore and interrupt it. It is eked out by the editor with letters, and we bid farewell to Adams at Newburyport on December 5, 1789, writing to his mother of his part in the reception of President Washington, his predecessor in office as time would prove: "I had the honor of writing the billet which the major-general of the county sent him to inform him of the military arrangements he had made for his reception. And I had the honour of draughting an address which, with many alterations and additions (commonly called amendments), was presented to him by the town of Newbury-Port." The latter task had been confided to the jurist Theophilus Parsons, whose "indolence was accommodated in shifting a part of the burthen upon his clerk."'

The sententiousness of young Adams's style freely marks and irradiates these pages, but we cannot indulge in many examples. In his Character of his classmate Learned, we read: "I would not give a fig for life, said he one day to me, if I could but plant immortality upon Ebenezer Learned. There is not at present any prospect that his name will obtain immortality; but he intends to be a preacher, when he may comfort himself with the idea that his soul may be immortal." Learned "acknowledges that his soul is tortured with ambition." Adams does not appear to have agonized on his own account, but lets you see his strong confidence in his own powers and his quiet aim to make his mark. After a day (December 11, 1787) over Blackstone he records:

"We had some conversation on the stale topic of self-love and disinterested benevolence. A subject upon which I have very frequently conversed with many different persons, and, notwithstanding everything that I have heard said upon the subject, I still retain the opinion which I adopted when I first reasoned upon it. I will not venture to say there is no such thing as disinterested benevolence, but I must say that, after searching as deeply as possible into my own mind, I cannot find a trace of it there."

Eighteen years afterwards, almost to a day (December 10, 1805), was born in Newburyport a shining exemplar of disinterested benevolence, never fully recognized as such by Adams, though they were fellow-soldiers against slavery, and though Adams had prayed in 1820 for a man to arise "with a genius capable of comprehending, a heart capable of supporting, and an utterance capable of communicating those eternal truths which belong to the question"; who had, as a youth, before his vocation was revealed, a pronounced ambition to be known, "at least to such an extent that common inquiry shall be unnecessary"; who presently edited in Vermont a paper in advocacy of Adams's re-election to the Presidency; who then deliberately forfeited advancement and reputation, and risked life itself, in behalf of the most helpless and degraded of his fellow-Americans; whose motto was, "My country is the world, my countrymen are all mankind." As a pendant to John Quincy Adams at twenty-two greeting Washington in Newburyport—Washington, who died an emancipationist—the historical painter may some day depict Garrison at nineteen, in the same town, pressing forward with the throng to clasp the hand of Lafayette, who more than once assured Thomas Clarkson that he would never have drawn his sword in the cause of America if he could have conceived that he was thereby founding a land of slavery.

We must not part from this reprint from the Proceedings of the Massachusetts Historical Society without calling attention to the extraordinary diligence bestowed upon the notes, which throw a flood of light upon the topics of the text; and, above all, on the numerous personages who flit across the stage. Mr. C. F. Adams makes special acknowledgment of assistance rendered in this research by Miss J. C. Watts, a recent graduate of Radcliffe.

FOUR NOVELS.

The Under Dog. By F. Hopkinson Smith. Charles Scribner's Sons.

The Sacrifice of the Shannon. By W. Albert Hickman. Frederick A. Stokes Co.

Sinful Peck. By Morgan Robertson. Harper & Brothers.

The Captain's Toll-Gate. By Frank R. Stockton. D. Appleton & Co.

Mr. Hopkinson Smith's genius for sympathy finds full expression in his stories of human under-dogs of one sort and another. Some of them are not particularly far under, being only hardworking captains or cabdrivers or paperhangers or Parisian waiters or sleeping-car managers. But each serves as a centre for an episode, rapid, vivid, story-telling. The most dramatic of all the number are the first three, which tell of the heavy pressure of the law on the whiskey-makers and whiskey-sellers in the mountains of Kentucky. There are undoubtedly moving pictures of a young mother with her baby dragged from her cabin into jail, of an old man wrongly arrested, of a thief punished for robbing the mailbag in the cause of righteousness. All are pitiful instances of justice gone wrong. And yet, as it chances, the moment is not a happy one for lamenting the over-insistence of law in the South, whether as to the safety of the mails or as to the disposition of whiskey. In stories of those who are delightfully called "old men with the bark on them," and of the small adventures of travel, this versatile pen is always timely. Mr. Hopkinson Smith is triumphantly not a member of the class which he thus happily describes: "The 'buttoned-up' misses the best part of travelling. He is like a camera with the cap on—he never gets a new impression."

To story-readers bored with drawing-rooms, shrinking from medicine bottles, heavy-laden with problem, whom man delights not nor woman either, we offer the advice to read 'The Sacrifice of the *Shannon*.' Here may be imbibed the pure strong air of Nova Scotia and the wholesomeness of perils overcome without gloom. Here are outdoor living, outdoor thinking, and outdoor feeling. The three or four principal characters are drawn with such robust tenderness that indulgence is willingly given to the perfunctoriness of certain lesser persons. The phrase describing "Caribou" (otherwise Pictou) as a little town "all beauty and repose and climate," indicates the tone and style of the book in its softer phases. This is what is said in connection with the heroine: "But remember, I mean real frankness and real unconventionality, not the poses. Women of all ages who pose as frank or unconventional, or both, are as common as barnacles on the bottom of a ship when she's been three years out of dock." From this infer the writer's powers of observation. As to his humorous side, many quotations might be made from Donald McDonald, the bland man of iron and dialect. But, for the icefields and the noble labors of the mighty ice-crushers, the book itself must be read. There is enough of love, adventure, scenery, and machinery in the little volume to enthral the entire family circle, and so judiciously bestowed that it would not be surprising indeed if fathers and sons were found tolerant of the romance, and if mothers and daughters should not skip the perils of the stokehold.

"Sinful Peck's" marine adventures were the result of what a certain comrade of his justly called "a fool bet on the Bryan election." This comrade was known as Bigpig, and there were others with equally descriptive names, who were all made drunk by Sinful and carried off on a voyage to Singapore. The refinement and charm of this beginning are more than sustained during the narrative. No one knows his brine and his boat better than Mr. Robertson, and in Sinful Peck's ingenious wiles and quibbles are occasional gleams of amusement. For the rest the story is odiously brutal. It is to sea stories what 'Bob, Son of Battle' is to dog stories. High praise this will be thought by many, and to them this book may be commended. We write not with intent to praise, but to warn off readers possessed of either sense or sensibility, and those who remember with admiration the author's fine earlier book, 'Spun Yarn.'

'The Captain's Toll-Gate,' besides its own interest, which is ample, possesses touching significance as the final work of Frank Stockton, in order of publication, though not the last writing of his pen—a

pen that has added much to the rejoicing of mankind, and nothing to its vexations. A memorial sketch by Mrs. Stockton prefaces the story—a sketch made with perfect taste, and with an appreciation as clear as it had every right to be partial. Here, in the last story we shall receive from Stockton's hand and fancy, is a representative showing of his invention, his tenderness, his drollery, his love for the sea and the garden, his comfortable, comforting way of leading the reader through mysteries of which one need never be afraid; his light touch on all things grave and gay that holds and fulfils the promise of a sunny hour. Capt. Asher's reason for taking the position of toll-gate keeper after his retirement from sea service was that "he liked to meet with people, and he preferred that they should come to him rather than that he should go to them." This is deliciously typical, and suitably proclaims the motive of the story. Grave-faced oddities in character and situation touch happily as ever the sense of incongruity, nor are there lacking epigram and mere sheer fun. "All things come to those who cannot wait. They are in such a hurry that they take what they can get," sighs a rejected suitor in a fit of recuperation. To another his rival's swearing "uphill and down dale" in an unknown tongue sounds as if the cursing one were "calculating his last week's expenses." But humorist though Stockton is in many ways—in his own way and in the best other ways besides—equally his is the spirit of human tenderness and all gentle affection. In his garden greatly flourished aromatic mints and fragrant roses. Only to the sour and the bitter was its soil inhospitable.

Le Japon: Politique, Économique et Social. Par H. Dumolard. Paris: Armand Colin.

The writings of the accomplished and critical author of this work in the *Far East* and other periodicals are well known to those familiar with Eurasian literature. He spent three years in Japan, employed exclusively in the study of the questions which have occupied the attention of the Government of Japan and of those who are interested in its people. Instead of giving his time and thought to "the enigmatic *mousme*," who is the Japanese Circe that throws acorns to the modern followers of wandering Ulysses, he devoted himself seriously to penetrating the problems of modern Nippon. He quotes on his title page a text from Lafcadio Hearn: "Indeed, the results of the new culture have served more than aught else to show the immense force of healthy conservatism in that race." In temper, however, the Frenchman is at the antipodes of Hearn, for whereas the latter is admiringly sympathetic, the Frenchman is intensely alien, sarcastic, and cynical. His whole idea seems to be to prove the truth of the ancient dictum of the first dwellers in the ports of 1859, that "in Japan the birds do not sing, the flowers are without perfume, the men without honor, and the women without virtue." In his conclusion, he reëchoes the bon-mot of a fellow-countryman, "The Japan of to-day is a bad translation." Take, for example, his word-picture of the Prince Imperial (p. 56):

"A child scrofulous and debilitated, continually in the hands of the doctors, he has even come to the age of manhood without relations with the rest of the world. Unknown to the people, without any personal prestige, we may ask ourselves whether, when the responsibility of power is placed upon him, he will find the necessary energy to cope successfully with the formidable demagogy which has made onrush into the Japanese political world."

One does not read very far before he discovers the animus of this patriotic Frenchman, who wishes the French and Russian world to know just what kind of an antagonist Japan would be in time of war, and exactly what a rival Japan is in time of peace. Despite the author's ill-concealed prejudices, however, he has certainly made a thorough study of the situation. It is safe to say that there exists no book which gives so full and exact a picture of the Japan of 1903. Many of his chapters are enriched with statistics drawn from the most trustworthy sources, which he handles with skill and ease, making them interesting almost to eloquence. What is not usual with the average French author, he spells the names of foreigners correctly, though an occasional lapse shows a Gallic peculiarity. His long dwelling upon the ground, while in Japanese employ, gives a firmness of touch in handling, for example, such subjects as the Constitution and the political parties. He is very full on finance and agriculture, and, apart from what seems to be an exaggeration of the defects of the Japanese as colonizers, he treats ably of the commercial and industrial evolution of Japan, even while scouting the idea of the pretended "Yellow Peril." He knows too well the inherent defects, moral and otherwise, of the Japanese workman, and is unable to believe that the Japanese have sufficient stamina to hold their own in the competition which they must encounter in hoped-for conquests of the world's choicest markets.

It is quite certain that no book thus far published gives so scientific a view of the labor question and of pauperism as does this. It may be that if Mr. Dumolard had seen the beggary, the horrible hygienic conditions, and the very unequal state of the peasantry in the various provinces in old Japan of even the late sixties, he would have modified considerably some of his rather pessimistic judgments on the contemporary Japanese. Indeed, one defect of his work seems to be in his apparent lack of familiarity with the country at large outside of a few great cities. Nevertheless, it is true, as he points out with unsparing detail—quite equal to the report of a Salvation Army major—that a new sort of pauperism has come to stay in modern Japan, and that in addition to the herding at industrial centres of human beings who are simply so many "hands" in a factory, there have grown up in the large cities new neighborhoods of abject poverty, or, in a word, slums.

On the subject of public instruction, religion, feminism, and art, the author is suggestive and interesting. On foreign politics he speaks as a master, though he probably paints in too sombre colors those weaknesses of Japan which arise from the rising tide of demagogism. He insinuates that the time will come when party passion will be mistaken for patriotism, and Japan lose that unity which hitherto, in resisting the onset of the foreigners and in carrying through the war with China, has been her greatest strength. He shows remorselessly how the financial problems of Japan consequent upon her adoption of modern civilization, and especially since her deceptive victory over China in 1895, have grown beyond the power of the resources of the country to solve, or the statesmanship of the Mikado's ministers to master. He points out, also, probably with no disposition to minimize, the insubordination in the schools and the decay of the ancient habits of reverence and obedience among the young towards their elders and to lawful authority. On the subject of Christian missionary work, conducted mainly by English-speaking people, he reveals the prejudices of one doubly an alien. His pictures of peninsular politics, in his chapter on Japan and Korea, are despairingly pessimistic, as though to hint that it would be a blessing to the world if Russia would step in and govern the little country where "in reality the most absolute anarchy reigns in the court and higher administration," and in which, over an utterly apathetic people, rules a good-natured puppet without will, energy, or ideas. Unfortunately, his picture is too true. The author intimates that the Japanese would in all probability strain their resources to the utmost to hold the upper hand in Korea, which country, as well as the Chinese province of Fu Kien, is deemed vital to their interests to control.

It would be hard to mention an important subject in contemporary Japan which Mr. Dumolard does not discuss with vigor, in his highly suggestive, informing, and well-written book.

Rural England. By H. Rider Haggard. 2 vols. Longmans, Green & Co. 1902.

Those who have read Mr. Haggard's novels would not have chosen him for an office requiring sobriety of judgment and accuracy of statement. They would have feared that his exuberant imagination and flamboyant eloquence might tend to make the record of his observations somewhat too fantastic for the purposes of science. A glance at these volumes, however, will convince any one that such apprehensions have not been justified. There is not a trace of exaggeration in the style, nor a suggestion of the influence of any motive except the desire to tell the plain truth. Regarded as a narrative of what Mr. Haggard has seen and heard, his book deserves hearty praise; and while he has not always seen and asked about the things concerning which we are most curious, his descriptions are generally instructive as well as interesting.

Yet we hesitate to recommend this book to American readers. Twelve hundred pages are too much; the condition of English agriculture interests few persons to that extent. Only such Americans as understand our agriculture and have occasion to travel through rural England will appreciate the elaborate county maps, and the minute particulars concerning numberless farms which are here presented. But it is not more than fair to say that every one who cares for rural life will find it hard to lay the book down after he has read a little way in it. Mr. Haggard's travels may lead nowhere in particular, but he is too agreeable a companion to part from willingly.

The picture drawn is that of a declining industry, and the causes of its decline are clearly disclosed. We might say the cause, for the lessened cost of transportation is the controlling element. Railroads and steamships have brought the prairies of America and the pastures of Australia alongside the farms of England. The price of corn has fallen, the profits of farmers have disappeared, rents have vanished; and in many cases both landlords and farmers have literally been swept away with their fortunes. Add to this the progressive income tax and death duties, and it is plain that the day of great estates is past. A few of the nobility still hold out, and by the practice of enlightened husbandry enjoy a precarious prosperity. But their days are numbered. Two or three deaths at short intervals in an English landed family would mean its ruin. New men may buy their lands, but they will not maintain the tenantry. The farmers will die or emigrate; laborers will abandon their falling cottages; the land will return in great measure to pasture, to forest, to waste.

The resistance to this process is enormous. Family pride dies hard; many of the gentry have kept their tenants long after their rents began to fail, and many tenants have clung to holdings that no longer supported them, because they had been the homes of their fathers for many generations. Even the laborers have remained on the land until the higher wages which the town could pay and the country could not, have drawn them away. Nor has there been a lack of ingenuity on the part of the farmers in struggling to meet competition. Manures are imported in vast quantities; every variety of machine is employed to reduce the cost of production. On good land and on land near the market, agriculture pays and will pay. Elsewhere it cannot, and its cessation is only a question of time. Something may be done by improving transportation, and something by introducing small holdings and market gardening. We fail to see why dairying and poultry farming are not more prosecuted, and why the coöperative creamery does not more prevail. But, on the whole, the agriculture of the past is doomed, and that which is to come will be on a smaller scale, employing different methods and devoted to other products.

As a matter of fact, the changes that have taken place are no greater, although more impressive, than those of the last sixty years in New England. The culture of wheat has declined in England; it has ceased altogether in Massachusetts. The farmers of the Eastern States buy their flour and much of their feed from the West. More land has been abandoned here than there; more families have been thrust from their ancestral acres. The changes have been little noticed, comparatively, because there was nothing dramatic about them. No order of nobility was overthrown; no tenants were exiled over the seas. Where there is nothing old enough to arouse reverence, the most revolutionary changes scarcely excite attention; and the New England farmers so plainly bettered themselves when they preempted the rich lands of the West as to make it vain to deplore their forced emigration. And as the growth of manufactures has given new value to much farming land here, so it has been in England. Probably the English farmer has been slower to give up unprofitable crops; almost as much wheat is raised in England as ever. At all events, the worst is over. Cost of production is not likely to fall much lower, and if it rises, rural England may renew its prosperity.

The Dispatches of Field Marshal the Duke of Wellington. Selected and Arranged by Walter Wood. Dutton. 1903.

In an age of anthologies and short cuts, one need not feel surprised at the sight of anything in the way of an abridgment. Were it not for this expectant state of mind, we should hardly be prepared, it must be confessed, for a *précis* of Wellington's dispatches. The complete edition, brought out by Col. Gurwood, occupies twelve large volumes, and was a work involving so much labor that immediately upon its completion the overwrought editor took his own life. Now we have a compilation in one volume which is based upon Col. Gurwood's *opus*, and is designed to exclude the dull and tedious parts of the bulky original. Mr. Wood contributes a few notes, but avows his book to be in other respects a piece of condensation. Apart from the Peninsular war, which is the great subject, Wellington's career in India is illustrated by extracts from his official correspondence, while the episode of his service in Denmark is noticed, and the Waterloo campaign is dealt with at considerable length. We must not neglect to state that a special section is devoted to the Duke's dispatches on American affairs during the war of 1812.

This book will be of slight service to the general reader; and as the student of military history will use the unabridged version of Gurwood, we can discover a field for Mr. Wood only among those who are particularly interested in Wellington himself, or among historians who simply wish to study the annals of warfare in their effect upon politics. Dispatches unaccompanied by extensive notes produce a disjointed effect; and where, in addition to omission, there is abridgment, the lack of unity becomes more apparent still. Fortunately for Mr. Wood, Wellington was a direct and characteristic writer. According to Lord Roberts's opinion, he has been underestimated as a general and overestimated as a man. His dispatches certainly strengthen the impression of his administrative capacity, and at times he even appears in the light of a politician—or, at least, in the light of a soldier with political opinions in the broad sense of the word. For example, he advocates the prosecution of the Peninsular war on the ground that no other expedient is so likely to prevent a Napoleonic invasion of England. Writing to the Earl of Liverpool nearly five years after Trafalgar, he says:

"From what I have seen of the objects of the French Government, and the sacrifices they make to accomplish them, I have no doubt that if the British army were for any reason to withdraw from the Peninsula, and the French Government were relieved from the pressure of military operations on the Continent, they would incur all risks to land an army in his Majesty's dominions. Then, indeed, would commence an expensive contest; then would his Majesty's subjects discover what are the miseries of war, of which, by the blessing of God, they have hitherto had no knowledge, and the cultivation, the beauty, and prosperity of the country, and the virtue and happiness of its inhabitants would be destroyed, whatever might be the result of the military operations."

This passage is worth quoting for the phrase about "the virtue and happiness of its inhabitants," but it also shows that Wellington, while not fit to be styled a politician in comparison with Napoleon, could, at least, address a telling political argument to the home authorities. Some of the dispatches relating to the American war are energetic in diction, and show how disturbed Wellington was at the posture of things in 1813. For example, he writes to Marshal C. Beresford: "I have been very uneasy about the American naval successes. I think we should have peace with America before the season for opening the campaign in Canada, if we could take one or two of these d—d frigates."

We may conclude by stating what we have already implied, namely, that this abridgment will probably prove useful to those whose business it is to know something of the connection between war and politics during the opening years of the nineteenth century.

Sexual Dimorphism in the Animal Kingdom: A Theory of the Evolution of Secondary Sexual Characters. By J. T. Cunningham, M.A. London: Adam & Charles Black; New York: Macmillan. 8vo, pp. xi, 317. Illustrated.

The theory of Sexual Selection was a postscript to that of Natural Selection, the idea being that, after having survived among the fittest, the male must compete with other males to obtain a female and leave progeny. In connection with fighting, courting, nesting, and other differences in the habits of the sexes, there are structural differences, secondary sexual characters, comprised in what is known as sexual dimorphism. These, in the Darwinian belief, originated through sexual selection, which is not to be separated from natural selection and does not account for origins. The volume in hand is a very comprehensive and convincing presentation of a Lamarckian explanation of the same phenomena and of their origin.

The structural differences of animals are arranged by the author as (1) structural peculiarities by which relationships and classifications are determined, Diversity; (2) the structural differences of individuals in the same species, Polymorphism; and (3) the structural changes undergone by the individual, Metamorphism. The special field of this discussion is the most common case under polymorphism, sexual dimorphism. The topics include such features as distinguish one sex from the other, horns, with shedding and renewal, callosities, ornaments, etc., etc. Gleaning from the conclusions, it is learned that the peculiarities are all intelligible if regarded as consequences of life and growth; stimulation of certain kinds by external forces causes growth to take certain directions, and that new growth has a tendency inherent in the processes of life, hereditarily, to resemble old growths in form; the variations occur when the particular habits and conditions produce them, and the real explanation of evolution lies in the explanation of individual variation. Evolution of secondary sexual characters is attributed to physiological principles of growth and modification.

A fundamental objection to the theory of

sexual selection, or to any selection theory, is that it does not account for the origin of the variations it assumes, and throws no light whatever on the facts (1) that the characters do not appear till the individual is sexually mature, and (2) that they are inherited only by the sex which possesses them. The true explanation is that heredity causes the development of acquired characters for the most part only in that period of life and in that class of individuals in which they were originally acquired; heredity being a tendency in the new individual to pass successively through the same stages of growth as its parent, the inheritance being a process rather than a state, and the special processes occurring by heredity in subsequent generations when the body is in the same condition, not otherwise. The view favored by our author is, that the direct effects of regularly occurrent stimulations are sooner or later developed by heredity, but only in connection with the physiological condition under which they were originally produced. This view is claimed to be new and original in its special details; in general it differs little from the theory of variational tendencies transmitted by heredity repeatedly suggested in this journal in comments on Darwinism.

In structure this book is an improvement on the works originally advocating the theories to which it is opposed; it is filled with instances formerly urged in support of those theories, but these same instances are now used to disprove the Darwinian contention, and have become thoroughly and effectively Lamarckian.

British Political Portraits. By Justin McCarthy. The Outlook Co.

The title of this book challenges a comparison with the late Mr. Frank H. Hill's 'Political Portraits.' Unfortunately, the result of the test is not what might have been expected from Mr. McCarthy's reputation. Neither in insight nor in literary skill does it come near Mr. Hill's brilliant series of studies. It is below the level of the book of the same type written by the late Mr. R. H. Hutton, of the political sketches in the volume called 'Modern Men,' and, indeed, of a great deal of contemporary journalism issuing from the Press Gallery of the House of Commons. The critical part of the book is sadly inadequate. There is practically no attempt, for example, to explain the secret of Mr. Chamberlain's success, or to show why Lord Rosebery's leadership, in spite of his many gifts, has been so ineffectual. In a single sentence of Mr. Massingham's in the *Speaker*—"Lord Rosebery is the chameleon of politics"—we are told more of Lord Rosebery than we get from the twenty-two pages Mr. McCarthy devotes to him.

Possibly it is because Mr. McCarthy is of too kindly a disposition to be critical. His optimism respecting the future of almost everybody becomes nothing short of amusing as one makes one's way through the book. Lord Rosebery has not yet done his appointed work (p. 69), but the time for him to take his real position will come soon (p. 72); Mr. Chamberlain "may well feel proud in the consciousness that the close attention of the political world will follow with eager curiosity his further career" (p. 98); Mr. Morley "has still, we may hope, a long political career before him" (p. 148); Lord Aberdeen "has yet, I trust, a long and fruitful career before him" (p. 174); John Burns "has good and great work yet to do" (p. 201): Sir Michael Hicks-Beach, though sixty-five years of age and not in robust health, "will before long begin a new administrative career" (p. 227); Mr. John Redmond "is still young enough to have a career before him, and I feel the fullest confidence in his future" (p. 253); "the best of Sir William Harcourt's work"—he is seventy-five years of age, we must remember—"is yet to be done by him" (p. 279); and Sir Henry Campbell-Bannerman "is destined to do great service yet to the Liberal cause, and to win an honorable place in British history" (p. 331). Evidently, for the next generation or so, there will be little chance for Mr. Asquith, Sir Edward Grey, Mr. Lloyd George, Mr. Wyndham, and other younger politicians, who are popularly supposed to be coming to the front.

The greater part of the book is taken up with biographical matter, presented in a readable fashion, but of no particular novelty or importance except in those instances where Mr. McCarthy has some reminiscence of his own to relate. The principal value of the volume consists in these incidents. We obtain, for example, first-hand particulars of Mr. Chamberlain's relations to the Nationalist party at the time of the Phœnix Park murders (p. 93); of Mr. McCarthy's intercourse with Mr. Morley, and its peculiar limitations, while the latter was Chief Secretary (p. 140); of a conversation between the writer and Mr. Gladstone, which did much to convert the English statesman to home rule (p. 269); and of the effect upon Mr. Morley of Gladstone's farewell speech in the House of Commons (p. 319).

In Mr. McCarthy's account of that speech he represents Mr. Gladstone as calling the question of the position of the House of Lords "a question which has become profoundly a truth." What he actually said was, of course, "a question which has become profoundly acute." The blunder suggests that Mr. McCarthy's book was dictated to a stenographer, and there are other indications of a certain carelessness in compilation in keeping with this theory. "Lord Viscount Cranborne" (p. 35) can scarcely have been passed by the author himself in the proofs. Mr. Balfour is represented on page 6 as having published his 'Foundations of Belief' during the Fourth Party days; actually, it appeared in 1895. In each of three distinct places (pp. 22, 71, 227) Mr. McCarthy spends a page or more in speculating on the prospects of the next election and the chances of a reaction against Jingoism. Twice he estimates the importance of the House of Lords in the Government (pp. 55 and 166); twice he shows the disadvantage of a Premier's being in that House (pp. 63 and 321); and twice he describes the change in London Government from the Board of Works to the County Council (pp. 57 and 190).

On the whole, these sketches make creditable journalism, but are a disappointment if judged by a higher test.

On the Polar Star in the Arctic Sea. By H. R. H. Luigi Amadeo of Savoy, Duke of the Abruzzi. Translated by William Le Queux. Dodd, Mead & Co. 1903. 2 vols., imp. 8vo, pp. xxii, 346, xii, 347-702. Maps and illustrations.

We have already summarized the itinerary of the Italian Polar expedition of 1899-1900, including the heroic struggle by which Commander Umberto Cagni succeeded in reaching over the ice the highest latitude yet attained. We now have, in two ponderous volumes, the official narrative of the expedition, together with a report on his ice journey by Commander Cagni, and another by Dr. Molinelli on the work of the second detachment and the state of health of the party during the whole expedition. The work is dedicated to the memory of King Umberto in a few moving lines addressed to the queen mother of Italy. The book is written in an admirable spirit, without pretence or egotism, and the translation is smooth and idiomatic. For those not especially familiar with Arctic literature the details given will be full of interest. For the Arctic expert there is little that is new. The equipment of the ship, the gathering of West Siberian dogs called for at Archangel, the encounters with the ice, the struggle northward over the floes—all this has for the expert little that is novel or remarkable, nor was the contrary to be expected. Once a land-margin is abandoned, the only differences which can be looked for between the narratives of one party and another lie in the latitude attained and the personal characteristics of the individuals concerned. Brave men encountering identical difficulties with similar equipment and aims must in the nature of things have very much the same story to tell. The party was composed of Italians and Norwegians, who, according to their commander, behaved through this voyage as though the crew were composed of one nationality. The courage, perseverance, moral and physical endurance of every sort of privation shown by the Italians composing the sledge expedition of Commander Cagni placed them in the same rank with the best explorers of more northern origin, and earned the gratitude and hearty appreciation of their officers.

It would seem after the experience of so many parties, including the present one, that one lesson might have been learned, *i. e.*, the inadvisability of too warm and heavy clothing. The difficulties experienced by the travellers from moisture within their clothing, footgear, and sleeping bags, point unerringly to the conclusion that the men were too warmly dressed, and too heavily covered at night. Relatively light clothing while engaged in active exercise, with an extra jumper of down or rabbit skin to put on while quiescent, are prescribed by the experience of expert sledge drivers during low temperatures. Other than this there is little to criticise in the conduct of affairs as detailed by the author. The experience of this expedition confirms the estimate made on data afforded by previous expeditions, that the best equipped and manned sledge parties cannot expect on long journeys over the ice floes to average more than three miles a day. A greater average, with present ideas of equipment, must be merely a lucky accident.

The book is issued from imported sheets printed on paper heavily clay-faced, and the weight of it is a weariness to the flesh. It can be read only while supported on a table or stand. This paper,

which crumbles into dust as one cuts the leaves, and sticks like chalk to the fingers, is not necessary to the proper printing of photo-engravings, but is offensive to every person of taste. The illustrations are of varied quality, some very good, the majority mediocre, none striking. The maps are excellent, and there is a fair index.

Texas: A Contest of Civilization. By George P. Garrison. Boston: Houghton, Mifflin & Co. 1903. Pp. v., 320.

Of all the authors who have contributed to the "Commonwealths Series," certainly none has had a more inviting subject than Mr. Garrison. Here, one would think, there was little necessity for a mere chronicling of the small beer of cross-roads politics; little difficulty in keeping in the main travelled roads of American historical development. If the subject is an attractive one, the writer's opportunities as professor of history in the University of Texas must have been equally exceptional. The result, however, is somewhat disappointing. While the book is far from being the poorest in the series, it does not level up with the best. If this is an unfair standard, it still remains true that Professor Garrison's 'Texas' is not as valuable a work as might justly have been expected by those who are familiar with the series as a whole; it neither gives us a great deal of new or detailed information (which the author states has not been his object), nor reveals any very suggestive or illuminative thought in dealing with the history of Texas as an incident in the expansion of the United States.

The book may be divided into three parts —the history of Texas to 1821, the history of the relations of Texas and Mexico from 1821 to 1837, the history of Texas from 1837 to the present time.

The first part is satisfactory. The description of the rivalry between France and Spain for possession, and the discussion of the types of Spanish settlement, the weaknesses and failure of Spanish colonizing methods, constitute the best treatment of the subject in English in brief space. While a fuller statement of the governmental organization of the *Provincias Internas* after 1775 would have been serviceable, the brief outline here given stands out in clear relief when compared with the vague, ill-informed treatment of the same subject in English generally. In treating of the relations of Texas and Mexico from 1821 to 1837, to which something over a third of the book is devoted, the result is still in the main satisfactory. The author traces in some detail the internal history of Mexico from the establishment of the Republic of 1824 to the centralizing reaction under Santa Anna; shows how the location and physical character of Texas made colonization from the United States inevitable; gives in detail the history of Austin's settlement; and then relates the story of the war between Texas and Mexico until the achievement of independence by the former in 1837. This struggle, the author impresses upon us, was the irrepressible conflict of two radically different types of civilization; slavery was merely one, not especially important, element in the difference. The war was entered into by Texas at first for the purpose of restoring the Constitution of 1824, which Santa Anna had virtually overthrown; not until this was found to be impossible did independence become the object.

This is very well, and doubtless this point of view needs emphasizing. But in emphasizing it we think Professor Garrison has underestimated the importance of slavery in Texas and of the slavery question in the United States. "The idea that it [*i. e.*, the colonization and revolutionizing of Texas] was consciously inaugurated and carried out with that object in view [extension of slave territory] is too palpably mistaken to be worth discussion," he says (p. 216). This is too curt a dismissal of a difficult matter. One may sympathize with the author's obvious dislike of the term "slavocracy," and still regret that he has not found it worth while to say anything about Sam Houston previous to his arrival in Texas. It was indeed a contest of two opposing civilizations that severed Texas from Mexico, rather than a contest between Mexico and the "slavocracy," but the contest was influenced not only by the existence of slavery in Texas, but also by the existence of the slavery question in the United States. The South needed new territory to protect the institution of slavery, and because of this fact there existed a community of interest between the slaveholding States and the slaveholding Texans, which made revolution more desirable and easier than it would have been otherwise. Not the existence of slavery in the United States, so much as the existence of slavery *in the Southern States only*, was the fact of vital importance in the history of Texas. If the author has failed to emphasize this fact, it is doubtless because of his anxiety to avoid the "slavocracy" ardor of Von Holst.

The last part of the book is, to say the least, inadequate. It is with a sense of bewilderment, deepening to positive amazement, that one reads chapter after chapter with scarcely more than a hint here and there of the tremendous issues that were producing civil war in the United States. The question of annexation is dispatched in the briefest, most perfunctory fashion. One might suppose that the issue depended upon the series of pointless battles which were fought by the Texan and Mexican armies, rather than upon events occurring in the United States. The civil war and reconstruction are susceptible, it appears, of a similarly conventional consideration. With every approach to the slavery question, indeed, the treatment becomes gingerly in the extreme. In a word, it is obvious that Professor Garrison has persistently fought shy of the historical problem presented by slavery in the United States. Whatever the real or fancied necessity for this method, it has proved almost fatal to what otherwise might have been one of the best books of an excellent series.

The index is fairly good. No bibliography has been prepared, and no references are given. The comparative inaccessibility of the material makes it desirable that the author should have performed this essential service for students of American history.

Inorganic Chemistry: With the Elements of Physical and Theoretical Chemistry. By J. I. D. Hinds. John Wiley & Sons. 1902. 8vo, pp. 566.

A dweller in town can do very well with no knowledge of zoölogy or botany; but everyday life nowadays demands acquaintance with a very considerable body of chemical facts, principles, and methods. For a first introduction to the subject, we have a work of genius, Mendeléef's 'Principles.' For physical chemistry there is the treatise of Professor Jones. We cannot see why it would not be better to begin one's descriptive study with the simpler, more instructive, and better understood—albeit the bulkier—organic branch. The reverse is the universal practice. It is a tradition from a time when the Berzelian theory appeared to render inorganic bodies the simplest things in the world, while organic chemistry was a chaos. However, all the books are written on the assumption that the student takes up inorganic chemistry first, and thus he is well-nigh compelled to do so. It is just as it is with geometry, all mathematics being written on the assumption that metrical geometry is studied first, projective geometry next, and topical geometry last of all, although no fundamental understanding of metrical geometry is possible except on a basis of projective geometry, nor of projective geometry except on a basis of topical geometry. The force of history asserts itself even in pure science. But arrange the curriculum as one will, there comes a day when the young chemist has to sit down and commit to memory a vast load of facts about the elements and their compounds. For that severe labor we have seen no single volume better adapted than this of Professor Hinds. It is well packed with well-chosen facts stated with the utmost simplicity; and there is not one that it will not pay a modern man to know by heart. A considerable number of extremely easy experiments are suggested, and the preface to this volume informs us that there is another for use in the laboratory. Such a volume is wanted.

One of the features which particularly adapts this treatise to memorizing is its strict adherence to Mendeléef's arrangement of the elements. Just here, too, is the principal fault of the book. It not only never suggests the inadequacies of that arrangement, as even Mendeléef himself often does, but it stuffs the new earthy metals into the Mendeléefian pigeonholes in a manner to make Procrustes grin. Praseodymium and neodymium, two elements so much alike that years of fractional crystallization are required to effect the separation of them, are here placed in different groups with a black line running between them to show that one of them is basic, the other acidic. Gadolinium and thulium are earthy metals whose elementary nature is not the most certain of facts. They both come from the same mineral and are difficult for an ordinary chemist to distinguish. One of them is made by Prof. Hinds to be intermediate between silver and gold, while the other is grouped with chlorine, bromine and iodine; and there is no reason whatsoever for this except that their atomic weights, which are dubious to the last degree, bring them into those places. There are other cases just as bad. In short, the "periodic law" of the elements is treated as if it stood on a par with the three laws of motion.

No chemist who thoroughly comprehends the logic of such inquiries and who

knows the history of attempts to classify the elements as it is set forth in Professor Venable's 'Development of the Periodic Law,' can fail to admire supremely the wonderful discovery of Mendeléef. But in physical inquiries it often happens that the student notices a regularity which, upon following it up, continues to be fulfilled, but only in a roughly approximate sense. This state of things shows that there really is some such regularity, but that it has not been correctly formulated. There must really be such a law, or it would not continue to be fulfilled at all. It cannot be correctly formulated, or it would be fulfilled more exactly. Such a law often goes on very satisfactorily for a long time, if one is not too particular, and then suddenly goes quite to pieces, though perhaps later it may come out clear and definite again. This is what we ought to expect in the case of Mendeléef's law; for throughout it is quite wanting in anything like numerical definiteness. It should be regarded as proved that the relations between the metals of the rare earths are not represented at all in Mendeléef's table; and if its lower lines can be regarded as fitting the facts at all, the fit is a mighty loose one, a sort of ready-made fit that would suit very different facts just as well. We ought to add that any complete discussion of the evidences of the periodic law ought to take account of several other considerations which we have not space to notice here.

It is a serious fault in Professor Hinds's work that it treats the law as if it were perfect. It not only teaches what is not proved to be true, but even what is proved not to be true. It may be said that the table, at any rate, lends a support to the memory. So it does; but it would do so all the better if its inadequacies were pointed out. They would forcibly strike the student's attention and serve as landmarks, so to speak, in what otherwise might appear to him as a desert of uniformity.

Ahead of Chamberlain!

"Mr. E. Phillips Oppenheim has really got ahead of Mr. Joseph Chamberlain in attempting to show, through the vehicle of fiction, that the salvation of the English workingman is dependent upon the restoration of a protective tariff in his country," says the *Boston Herald* in an editorial review of the novel

A PRINCE OF SINNERS.

Illustrated, 12mo, $1.50. At all booksellers.

RALPH WALDO EMERSON.

"A pleasing photographic portrait is that of Emerson. The plate is large, about 13x16, and the bust figure is well set in this area.

"The poet is shown in post-meridian, but not in senile aspect, with a genial, relaxed expression, quite unconscious of posing for the camera

"The portrait is an excellent one for private hanging or for the wall of the school-room, church parlor, or other public place."—*The Nation.*

Algerian and Colonial Legislation—Mussulmanic Law.
Legislation of Railways.
Political Economy—Social Economy—Labor Legislation
Public Health and Important Public Works.
French and Foreign Finances.
Money, Credit, and Exchange—Banking.
Commercial Policy of the Great Powers.

GENERAL INFORMATION.

The instruction given at the School of Political Sciences is the natural crowning accomplishment of every liberal education. In each of its several branches the pupil acquires the requisite competency for holding high State Offices (Diplomacy, Council of State, Court of Accounts, Inspection of Finances, Inspection of Colonies), in getting thoroughly prepared for the examinations and competitions which they call for, and is also trained for leading posts in all great private enterprises.

The pupils are admitted without examination, with the approbation of the Director and School Board; no University degrees are necessary.

Tuition comprises 2 years' course, which may be extended to 3 years. On completing his studies, every pupil who has successfully passed his examination receives his diploma.

SCHOLAR YEAR, 1903-1904.—The Scholar Year commences on 9th November, 1903, and closes on 7th June, 1904. Applications are received at the Secretary's Office from 3d November, 1903. Application for the whole Course gives right to all the regular and complementary Courses and Conferences, and also access to the Library (about 25,000 Volumes and 160 French and Foreign Reviews and Newspapers). Per annum, $60.

A Special Pamphlet giving detailed information on the organization of the School and respecting the Professions for which the Pupil receives special training can be had by addressing to
L'ECOLE, 27 Rue Saint-Guillaume, PARIS.

Mr. JAMES LANE ALLEN's new novel

The Mettle of the Pasture

Cloth, $1.50

"'THE METTLE OF THE PASTURE' as a story, has a heart-break in it, because it is the story of life. Its dominant note is its intense vitality and humanitarianism. The tragedy of life, its failures, its weaknesses; the loneliness and isolation in the life of every soul that is born into the world; the pitifulness of life in its meannesses; the greatness of life in its hopes and ambitions; the austereness of life in its answer to duty; the sacrifice of life in its service to love are played upon, evoking some discord, but striking chords that lift the mind above the slough and strife of the coarse and ignoble, while the strains echo in the ear."—TIMES-DISPATCH, Richmond, Va.

The Nation.

NEW YORK, THURSDAY, JULY 30, 1903.

The Week.

One of the half-battle words of Gov. Durbin of Indiana was "treason," as applied to the action of labor unions who forced their members to resign from the militia for having fired on a mob. The thing is spreading. In Texas and in Pennsylvania, organized labor is showing its teeth in the same way. The idea is growing among trades unions that the power of the State to suppress domestic violence is a power inimical to their plans and purposes; and accordingly they are laying down the doctrine that a man cannot be both a unionist and a militiaman. There could not well be a franker admission that the union programme, say what the leaders will in public, is founded upon force. As it is not possible to win by violence when there is an arm of the Executive power expressly designed to put down violence, the unions make their attack upon the militia—indirectly, for the present. What they will do later, if unchecked, may be inferred from their constantly betrayed assumption that they are above the law and above the State itself. They have set up a sovereignty within a sovereignty, and hope in the end to make Labor supreme over Government. Of course they will not succeed, and of course the labor movement will in time be compelled to disavow the rebellious and treasonable elements now so strong within it; but the present duty of good citizens is none the less obvious. That is, to resist at all costs a tyrannous power which would erect itself above the State.

The reinstatement of Foreman Miller of the Government Printing-Office put the union employees who brought about his illegal dismissal in the following dilemma: Since the constitution of their union forbids them to work with a non-union man, they must either disobey (or amend their constitution) or else stop work. For the moment they have evaded the issue by continuing to work "under protest." Protest against what? Against the law of the nation which requires that civil-service appointments shall not be restricted to any favored class of citizens. To-day the workmen under Foreman Miller have formally put themselves on record as opposed to that law, and for to-morrow or next day they contemplate the possibility of trying conclusions between two constitutions—that of the International Bookbinders' Union and that of the United States. Such pretensions would be merely absurd were they not alarming. Granted that the snarling of the Washington bookbinders is merely bad temper for the shrewd rap they have received, it certainly does indicate a conviction that their union has especial and superior rights, with which even the Government may not interfere.

An unsuspected depth of corrupt trades unionism is exposed in the trial of Lawrence Murphy, formerly treasurer of the Brooklyn Stone Cutters' Union, and, curiously, the telling evidence of Murphy's various extortions is brought out by the counsel for the defence. Murphy and his "secret committee" have outdone anything charged against Parks and Carvel. Where it is alleged that these individual walking delegates have blackmailed employers in the name of the unions, it appears by Murphy's own testimony that he had a small syndicate which collected strike money from many contractors, and voted the proceeds into its own pockets for "advances of salary." To employers this little band of extortioners represented the unions; in reality, it was a piratical enterprise, for convenience flying the union flag. As yet it is not known how far these secret committeemen had the support of the union, but it is significant that most of them had affiliations with organized labor. Murphy's conviction on a charge of grand larceny is perhaps the least important result of his extraordinary trial. Judge Newburger, in his charge to the jury, very properly ruled that the question of how the labor organization came by the money which Murphy took was not the one to be decided, but it is distinctly fortunate that the defence was of such a nature that testimony on this point was adjudged material and was admitted. Murphy staked his case on the assertion that the money which he was accused of appropriating never was in the possession of the union—a curious defence, but probably the only chance he had of escaping. If the judge had permitted this question to go to the jury it might have constituted a possible basis for some such verdict as Western juries used to give: "Not guilty if the prisoner immediately leaves town." But at any rate, it opened the door for an account by witnesses of the holding up by walking delegates of the Brooklyn Bosses' Association, which paid $10,000 in cash to a "secret committee" to have a strike declared off.

The views of Congressman Lovering of Massachusetts on the tariff question are important, not only because he is one of the few Republicans of the House who can be got to speak out on the subject, but also because he has something definite to propose. In his address before the Furniture Association in this city on Thursday evening he announced some truths which, however, we fear his party associates in Congress will regard as rank heresies. He spoke, for instance, of "the great and growing sentiment in favor of tariff revision." The "stand-patters" are pretty sure to lift their eyebrows at this, and ask disagreeably why they have never heard of it, if it is so great. Mr. Lovering's particular panacea is a more liberal law relating to drawbacks on imported material used in the manufacture of goods for export. At present, the material has to be positively identified in the exported article, and the manufacturer is never sure that he will be able to convince the authorities and get his money back. "Nothing less than a liberal drawback law, enacted at the next session of Congress," says Mr. Lovering, "will save the protective tariff from a fearful onslaught, if not utter demolition." But, knowing of old the sensitiveness of the protectionists, we suspect that they will regard Mr. Lovering's bill as in itself an onslaught which must be repelled.

The Furniture Association of America associates itself with the Boston Board of Trade and the millers of the Northwest in urging the reconvening of the Joint High Commission and the passing of a reciprocity treaty with Canada. Of course, these furniture makers will be absolved of anything like free-trade sentimentality. They are practically all, as their President, Mr. Shearer, said last Friday, protectionists; but they find themselves oppressed by duties which bear more heavily upon their raw material than in favor of the finished product. Naturally, they would like to be in the favored position of the shipping industry, which enjoys free entry of building materials; but, knowing that this is impossible, they would welcome a revision of duties which would reduce their cost of production and increase their export trade. It seems likely that this conservative sentiment for tariff revision will grow. In fact, sentimental attachment to protectionism as such cannot long survive real considerations of commercial expediency. Then, the old alarmist arguments have worn thin. Here we have the stock market in total collapse—not as a result of Clevelandism or free-trade agitation, but in the piping times of the "stand-pat" evangel.

The dismissal of Charles Hedges, Superintendent of Free Delivery, is a fresh reminder that the postal inquiry has by no means come to an end. By all odds

one of the worst features of the Hedges case is the additional proof it gives of the lax tone of the entire Department. That precious official shows no signs of shame at having defrauded the Government, but only anger that he has been found out and betrayed by one who was his confidential clerk for three years. This clerk, it seems, gave information to the inspectors, in the shape of private letters from Hedges, which proved that he had collected per-diem expenses for days when he was attending to his private affairs many miles from the places where he swore he was. In defence of his practice of lending his travelling commission, Hedges alleges that he was authorized to do so by the high-minded but indicted Mr. Machen. Moreover, he protests that his alleged offences are practices too familiar in the Department to warrant his being singled out for punishment. The time for the promised Presidential review of the entire investigation is rapidly approaching.

Mr. Charles Emory Smith is left in a still more pitiable plight by Commissioner Procter's replies to his latest attempts to wriggle out of the responsibility for some of the flagrant violations of the Civil Service law which went on during his administration under the excuse of a war necessity. Not content with his letter to the Postmaster-General, Mr. Smith had attacked Mr. Procter in the editorial columns of the Philadelphia *Press*, personally abusing him and charging him with seeking exceptions to the civil-service rules on behalf of his own relatives and friends "more than any other man in Washington." It is not difficult for Mr. Procter to refute this malicious statement, which he does in the flattest and most explicit way. In another letter he then takes up Mr. Smith's defence and disposes of it in a way which will, we believe, be convincing to every unbiassed reader—that is, to every one who does not feel with the Washington *Post* that Mr. Smith's defence and counter accusations belong in the field of genuinely humorous writing. Mr. Smith, it will be remembered, lightly dismissed the violations of law in the Washington city post-office by saying that they were the concern of the Postmaster and not of the Postmaster-General. But, as the Tulloch revelations brought out, the worst offences in the Washington office were directly attributable to the Department and its first assistant secretary.

Two more pleas of guilty in the Alabama peonage cases were entered on Monday. This shows not only that the proof against the accused men was overwhelming, but that the energy of the prosecuting officers and the determination of Judge Jones, the Federal Justice presiding, have taken the heart out of the defence. The lawyers have even given up the attempt to get a hung jury, on the ground of political prejudice, as they succeeded in doing in the first trial of Fletcher Turner. One of the men who pleaded guilty on Monday had fled from Alabama to Texas. That took him out of the jurisdiction of the State courts, but the arm of the national Government was long enough and strong enough to bring him back. Indeed, we think that it will now be generally admitted by the Alabama newspapers—as it was by some of them before the trials—that nothing but the intervention of the Federal power could have brought the guilty men to justice. Thus a potent precedent has been set for like action by the general Government in dealing with other forms of oppression of its negro citizens.

The benevolent societies interested in protecting women immigrants and in preventing the importation of immoral persons into this country are not satisfied with the action taken by Mr. Williams, the Commissioner of Immigration, in doing away with the women inspectors who were recently employed for a period of ninety days and then discharged. It will be remembered that, in April, thirty-eight societies were represented at a conference in this city, and that they heartily approved the appointment of the women inspectors, and sent their thanks to President Roosevelt. Unfortunately, the new inspectors entered upon their duties in a blaze of publicity, which made the beginning of their work unnecessarily embarrassing and difficult. But, even in the short period of their employment, they were able to render some services of value, one of them saving a young French girl of sixteen who was being brought to this city for a life of shame. Naturally, the sudden ending of the experiment satisfied no one really concerned in stopping the white slave traffic. A year's test might perhaps have demonstrated the true value of women inspectors, but certainly no shorter period. As we understand the matter, it is now to come before Secretary Cortelyou, in such a way, it is to be hoped, that he will give his personal attention to the subject. If women are not fitted for this delicate work, then the proper men should be found. All over Europe, people and societies are moving against this traffic. The recent occurrences on a steamer bound for this port afford proof, if nineteen responsible passengers are to be believed, that the gates are by no means as tightly closed to immoral persons as they ought to be.

The immigration figures for the year are of a kind to cause solicitude. Of a total of 921,000, including some 600,000 aliens not of the immigrant class, the enormous number of 672,000 came from Italy, Austria-Hungary, and Russia. These are aliens, indeed, in a sense in which the word cannot fairly be applied to the German and Scandinavian immigrants. The Northern immigrants come with a conscious intention of becoming Americans, and often with some knowledge of what that implies. The Russians, Austrians, and Italians arrive with but very vague ideas of bettering their condition, and with absolutely no sense of what republican institutions mean. They are, as soon as naturalized, easy game for the political organizer, and will be, when once they get beyond the grade of manual labor, plastic material for the union agitator. For the four great immigration years beginning with 1900, and including this year, the total immigration from these three countries has been 1,680,848, or 2 per cent. of our entire population. Evidently the problem of assimilating this mass is a serious one. It takes, roughly speaking, a period of forty years for assimilation to become complete, and immigration at the rate of a million a year for forty years would be formidable indeed. But there is every reason to believe that, just as German and British immigration dropped sharply after 1893, and has continued to diminish, so the present flood from Austria, Italy, and Russia will in turn decrease.

The really striking fact about the Stock Exchange failures is that failures should have been so long delayed. Depreciation of values, during the four past months, has been exceptionally great, and since bankers and brokers use their security holdings as a basis for further borrowing, a shrinkage of 20 or 30 per cent. in the value of such collateral means that the amount thus cut from values must be made up by selling or pledging other securities. The absence of insolvencies, therefore, means either that stock brokers as a class have been borrowing very little recently, or else that they had abundant reserve resources still unpledged. As a matter of fact, both suppositions are correct if applied to the Stock Exchange as a whole. Both brokers and customers had their danger signal eight or nine months ago, and both took the warning properly to heart, retiring prudently from the speculative market. It is also true that the windfalls of recent years have left the bank accounts of Wall Street commission houses well provided against the present time of need. This, and the very intelligent attitude of the "outside public," during the past two years, explain why, even with the long decline and the multiplying failures, nobody talks of such a thing as "panic."

Probably the last man whom the Democratic machine in Missouri would think

of nominating for Governor is Circuit Attorney Folk, but he may yet be nominated. The Kansas City *Times* prints a list of seventy-nine rural newspapers of the State which have come out in favor of Mr. Folk's nomination, and it is said that the list is growing daily. The Circuit Attorney began sending his party associates to jail very soon after he was elected. He turned a deaf ear to those who spoke to him of "gratitude" to those who elected him, or of the hope of political preferment in the future. In fact, he committed what the politicians describe in awesome tones as "political suicide." They told him that after this he could not be elected even a justice of the peace, but he replied that it made no difference so long as he did his duty as Circuit Attorney. In the face of advice, threats, and pleadings of all sorts, he went ahead collecting evidence against evil-doers and making them pay the price of their misdeeds. And now, strange to say, it is discovered that his "political suicide" was all a mistake, and that he may live to be the next Governor of Missouri.

The first bye-election in England since Mr. Chamberlain flung his bomb can be interpreted only as a rude blow to his hopes. Not only did the Conservative vote at Barnard Castle fall off, but the adverse polling was so heavy that even with the Opposition split into two factions the Chamberlain candidate was unable to slip in. The fact that the successful man was a labor candidate is also full of ominous significance for the Colonial Secretary. He has made his bid especially to workingmen. Their wages he was going to increase by protective tariffs, while their old age he was to provide for by pensions out of the huge surplus that was to be heaped up. But in this particular constituency, at any rate, the laborers not only refused to be captured by his blandishments, but turned in and elected their own representative over his head. The result will do much, we think, to help Mr. Balfour come to a "settled conviction" about preferential tariffs—a conviction that they spell political defeat.

With the passage of the London Education bill through the Commons, the whole of England and Wales has for the first time a comprehensive school system. Executive authority is lodged in the County Councils, subject, however, to the approval of the Central Board of Education. A real grievance in the bill is the fact that it takes in all the Church of England schools at the public expense, while it leaves such schools almost wholly in the hands of their private managers. Already this imposition has been resisted by the refusal of many dissenters to pay the school rates, and eventually the State must in justice treat all public schools alike. Sir William Anson reported recently on the progress made in a year under the first Education bill. Some two-thirds of the County Councils had presented satisfactory programmes, and generally the new system was replacing the old without undue friction. From individual localities, where frequently the Church school is the only one, a different story is heard. Sir William Anson showed a wholly conciliatory spirit towards such complainants. But, as the school system develops, it will become apparent that many of the weaker Church schools which are now thrown on the public funds should be secularized, or put back upon their own resources. In London, where the old School Board was singularly well-organized and successful, there will be much just resentment at the transfer of authority to the County Council. If that body will have the wisdom to use old members of the board on the borough and local committees, the application of the new system will be facilitated. All in all, the country will gain by the Education act—not that the system is a good one, but that any system was preferable to the old confusion of authority. Time will make Mr. Balfour's bargain with the Bishops about the Church schools seem not only unjust, but intolerable.

Mr. Wyndham's land-purchase bill, as it passed the third reading, last week, bore only a general resemblance to the original act. Mr. John Redmond and the Irish Secretary have debated the bill, clause by clause, and in most cases the Irish Secretary has cheerfully accepted Mr. Redmond's view. In this manner the clause which provided for a perpetual rent charge has been abolished; the minimum purchase price has been removed; the Government bonus extended to a much larger class of transactions than was at first contemplated, and the sporting rights made transferable to tenant purchasers. All these changes have had the common effect of favoring the peasant proprietors as against their landlords. If Mr. Wyndham has given the impression of being rather helplessly in the hands of his Irish friends, he yet deserves the heartiest congratulation for a patience, good humor, and tact not often exemplified on the Government benches. Only those who supposed that the land question and the Irish question were identical have reason to be disappointed. To such the expense of the law will appear out of proportion to its ulterior political benefits, which seem likely to be small. Mr. Redmond, with polished irony one must believe, thanks the Government for putting Ireland in a position to work advantageously for Home Rule. Prof. Goldwin Smith, an old Liberal Unionist, has recently, in the *Evening Post*, expressed despair of any solution short of independence. And even Mr. Balfour admits that the fight is yet to come, and only asks the Irish, in view of the removal of their worst material grievance, to fight fair.

A number of members of the Belgian Chamber of Deputies are preparing, it seems, a counter-blast to the recent House of Commons manifesto. This is to prove to the world that all the horrible revelations which have come out of the Congo Free State in the last five years are pure inventions. There is no such thing as impressing cannibals into the native army. Mr. Morrison's accounts of the native chief who dried eighty-one human hands over a fire to show that his officially inspired raid was successful; of the carloads of slaves he himself saw; of the cannibalism permitted by those wearing the Belgian uniform; of unrestrained massacres and wholesale pillaging of village after village—all these are pure fictions of the stout-hearted American missionary who has ventured to speak out. When Sir Charles Dilke declares the Free State an open sore, and Mr. Stead denounces the King of the Belgians as being "guilty of one of the most shameless breaches of trust of which a crowned head has ever been guilty," they are, of course, merely jesting. The main thing is, that the King and the great land monopolies which have divided up nearly the whole of the Free State among themselves shall continue undisturbed in their process of imposing the benefits of a superior civilization upon the natives, and at the same time filling their own pockets.

The official Belgian replies to the charges of cruelty in the Congo Free State remind one of those which emanated from Washington in regard to the water-cure tortures. For years the Belgian Government denied the existence of any outrages. Then it set on foot bogus investigations, even sending out a commission of Protestant and Catholic missionaries, who could not see the wrongs before their eyes. Now we learn that the Government "regrets the existence of sporadic cases of cruelty and wrongdoing." Well it may, in the face of such strong testimony to the gross abuses under Belgian rule as has been given by the Rev. W. M. Morrison. This he now repeats in the current *Review of Reviews*. In time, Mr. Morrison and the few like him who have dared to tell the truth may even get the Belgians to admit that the outrages have been more than "sporadic." Meanwhile, it is charged in Belgium that Mr. Morrison is complaining because he was denied certain privileges he asked for. This is the characteristic attitude of Imperialism. If you cannot refute your critic, proclaim that he is disgruntled, or that he desires to encourage your enemies, or that he would befoul his own nest. These and other stock phrases may be counted on to appear in all such cases.

HOW TO PUT DOWN LYNCHING.

Scarcely had Prof. William James's acute analysis of the lynching mania got into type when another horrible example of it came to prove his words true. The skilled psychologist had said that lynching is now in this country "a profound social disease," and that it is "certain to become endemic in every corner of our country, North and South, unless heroic remedies are swiftly adopted to check it." He added that "the North is already almost as fully inoculated as the South," and predicted that such riots as that at Evansville might be expected any day in any other Northern city.

Danville, in Illinois, on Saturday fulfilled Professor James's prophecy almost as soon as it was published. This Northern city of 15,000 people, amply provided with schools and churches and newspapers, the home of the designated Speaker of the House of Representatives of the United States, suddenly found itself at the mercy of a bloodthirsty mob. It was the usual story. A negro accused of infamous crime; the officers of the law duly arresting him; a frenzied mob shrieking for his blood; collisions and murders in the streets; the jail attacked and a courageous sheriff fighting off the respectable miscreants; the latter rushing off to glut their fury on another negro, who was lynched with every circumstance of atrocity; the militia called out, and Danville saved by military rule from being sacked by its own citizens—it is the familiar and disgraceful round that was run. The same newspapers that make us sup on these horrors bring also news of two simultaneous lynchings in the South—one of them of a woman, the other of "the wrong negro"—and of another threatned and barely averted in Pennsylvania.

The whole phenomenon, with the steady march of lawlessness and ferocity to the North, is enough to stagger the stoutest patriot. We are in the presence of a new national peril. Senator Tillman is quite right in maintaining that lynching can no longer be said to be sectional. As a nation, we are disgraced by it. As a nation, we are also put in imminent danger by it. For let no man attempt to deceive the people with smooth words. Professor James is irrefragable. A plague worse than the cholera is upon us. Epidemic lawlessness, stamped all over with fiendish brutality, is a thousand-fold more to be dreaded than epidemic disease. There is no need to waste breath in either describing or denouncing the frightful evil. Every man not steeped in ignorance or lapped in delusion knows what it is—knows that it is not merely making us a hissing and scorn in the eyes of the world, but is undermining our own safety, and causing American society to revert to the time when no man knew at what moment a savage foe might not spring upon him from ambush. The time has passed to apologize for lynching, or even to explain it; and we must all unite to put it down if we would not see it topple all our laws and courts into the abyss.

That the sharpest and sternest measures against lynching mobs should everywhere be adopted by the officers of the law goes without saying. Professor James seems to desire some form of special legislation *ad hoc*. But there are laws enough. The statutes against murder are ample—and lynching is murder. If governors and sheriffs and police officers will enforce the present laws up to the hilt, we need ask no further enactments against lynchers. Let every officer who refuses to parley with the mob, and talks to it in the only language it can understand, receive a special meed of praise from his fellow-citizens. That sheriff in Danville who stood to his guns and disabled a dozen of the rioters, deserves well not only of his county and State, but of the entire nation. He did what he could to strike down an enemy more formidable than any foreign levy. It was upon the fanged head of the new domestic treason that he set his heel. If the citizens of Illinois know what becomes them at such a moment, they will find some means of testifying their gratitude to Sheriff Whitlock for his great public service. Sheriffs everywhere must be given to understand that this is what is expected of them. It is said that an "ungovernable homicidal instinct" takes possession of the mob; a vision of blood is before them. But if they are made to know that the blood will, in every case, be their own, and not that of a trembling and helpless victim, they will find a way to govern their instincts. It is good psychology as well as good patriotism which calls for the putting down everywhere of the lynching madness with an iron hand that knows no faltering.

But there is also a great duty laid upon every law-abiding citizen, whether directly in contact with the lynching spirit or not. He must do his part to bring about a correct state of public sentiment. Against all forms of race discrimination he must set his face like a flint; for he will see, if he keeps his eyes open, that the prime initiative of all this shameful access of lynching has been, as Professor James says, the notion, which has spread with "appalling rapidity," that "any negro accused of crime is public spoil, to be played with as long as the fun lasts." This is the fruitful mother of all our woes. Even if we thought the negro always a brute beyond the pale of the law, we should be bound not to assert it, or ever to say thoughtlessly, "Served him right," since through the negro the licensed mob is striking at our national life, and no man will be safe if the thing goes on. So we affirm that every form of apologetic reference to the lynching mob is, as the case stands to-day, a kind of participation in the crime from which every good citizen will refrain. Let us hear no more about "passional crimes," and "If we were only in their places," or "Could we but see the woman's face." The terrible fact is that we are face to face with a kind of national dementia. We are in danger of going mad. An individual over whom such a peril hangs observes the strictest regimen. So must the nation. We must all desist from countenancing, even in our private speech, even in our secret thoughts, anything but the severest and most sweeping condemnation of lynching. Only so can we nerve the officers of the law to do their duty and prevent all our institutions from tumbling into the pit. In the present hour of peril from furious mobs driven by wild obsessions, we can only denounce as a recreant any man who is able to find words of extenuation or tolerance for them.

THE SENSE OF PUBLIC OBLIGATION.

Recent exposures of the varied activities of some of our leading statesmen have revealed a dulled sense of the obligation attaching to public office. "Do you want me to be a drone?" indignantly demanded Congressman Hull in the House of Representatives, when called upon to explain his connection with timber purchases in the Philippines. Congressman Littauer would doubtless echo the scornful inquiry, and so would Mr. Driggs of Brooklyn. A host of less painfully conspicuous public servants would sustain them in chorus, including those "literary" Congressmen, Grosvenor and Richardson. A Congressman receives a pitiful salary of $5,000 a year. Does anybody think he can live on that? Besides, men who get elected to high office are certain to be men of force and restless energy. They must be active; they must be up and doing. Shall they turn their back on business opportunities merely because they are in a public position? If they are lawyers, shall they refuse retainers? To some of them the very idea seems absurd; to others it is disquieting. Considerable confusion regarding the whole matter exists also in the public mind.

It is in the legislative branches of government that the question presents itself most frequently and with the greatest urgency. We know of United States Senators who, during their term of service—not only while Congress is in session, but also in recess—steadily refuse to be employed by corporations which they would, under different circumstances, be glad to serve. On the other hand, there are many Senators who frequently accept such employment during the intervals between sessions,

and occasionally even while the Senate is sitting. The view of the first sort is that they must be absolutely removed from all personal interest in corporation affairs, since these may at any moment become subjects of proposed legislation. The view of the other kind is that, so long as they do not neglect their legislative duties, they have a perfect right to continue their ordinary pursuits; and they feel competent to hold themselves free from bias notwithstanding. There is, of course, a third class, which need not be discussed, since the endeavor of its members is not so much to avoid falling below even well-established ethical standards as to escape the provisions of the Penal Code.

Many of the nicer scruples thus raised must in the end be referred to the conscience of the individual. The public, if it ever hears of it, may applaud the Senator who refuses the corporation retainer; but there is now no open complaint of the Senator who accepts it. Even in less doubtful cases, where, for instance, a Congressman successfully evades the law about Government contracts but is clearly a party to one, though nominally and legally not so, the public is powerless to get at him immediately and effectively, except through his sensibilities. But not every man who dodges legal penalty is entitled to escape public censure. If for some technical reason the law cannot step in, the legal impunity imposes no obligation to look upon it as a moral acquittal. A contrary opinion, we are aware, is prevalent, but it rests on no sound basis. The man who pleads that the statute of limitations has relieved him of responsibility for a misdemeanor, is entitled to be set free, but society has a right, even a duty, to draw its own conclusions.

In other words, two classes of obligation are accepted by the man who takes public office. One is legal, and will be enforced by the courts; the other is moral, and will be enforced by his conscience and by public sentiment. The extent to which the latter affects his conduct will, of course, depend upon his own enlightenment and that of the community. The moral obligation can be violated without conflict with the courts. The legal obligation, on the other hand, being a statutory expression of the more crude and patent of the ethical considerations involved, cannot be broken save by utter disregard of the moral.

What course, then, must a public officer pursue? First, he must obey the law. We hear the excuse made for the Littauers and the Gaffneys and the Driggses that, after all, they have only "technically" violated the law, if at all. But, we ask, in order technically to violate the law, what amount of moral obligation have they not cut through ruthlessly? The Federal law says that a Congressman may not be interested directly or indirectly in a contract with the United States, but that he may be a stockholder in a corporation which is interested in such a contract. This may not strike one as a particularly intelligent distinction, but it is the law. Shall we, consequently, ask a kindly public sympathy for one who becomes legally involved simply because he failed to incorporate his company and thus get around the law? Or shall we merely regard the letter of the law as the whole of his obligation, and be content with holding him rigidly to that? Loose thinking lies back of all our loose practice in these matters. The times call for the nicest sense of honor on the part of public men. Especially in such a get-rich-quick epoch as the present, do we need to hold up the standards of an elder and severer day—of an Adams and a Bayard. A commercial age laughs at their nice scrupulosity in dividing the private business interest from that of the commonwealth; but it is the only salt which can keep our public life sweet.

EMERGENCY CIRCULATION.

Senator Lodge's interview with President Roosevelt has led to a fresh discussion of plans for currency legislation at the next session of Congress. All that the President said was, that he hoped the subject would be brought up for early consideration. He had said as much or more last spring in a written communication to the President of the American Bankers' Association. That body, at its convention last November, had provided for the appointment of a committee to report a plan for currency reform to be presented at its next annual meeting, and President Roosevelt had taken occasion a few months later to express, in a private way, his general concurrence in the movement and his hope that it might lead to some beneficial result. His position now is little more than a repetition of what he said in that communication, and also in a speech made subsequently at Keokuk, Iowa. In the latter he spoke of the want of elasticity in the currency as now constituted, and of the need of a change in the laws to secure "such expansion and contraction as will promptly and automatically respond to the varying demands of commerce."

This expression pointed to a concurrence in the principles rather of the House bill of last session—the Fowler bill—than of the Senate measure, commonly called the Aldrich bill. The former embraced a plan for banknote issues based upon the general assets of the banks, instead of bonds deposited in the Treasury. The latter provided for the substitution of State and railroad bonds of a certain grade in place of United States bonds as security for Government deposits in the banks, and made no change in the system of banknote issues. It was inferred by some persons that the Aldrich bill, if passed, would become a stepping-stone for a change in the national bank system, substituting the same classes of bonds as security for note issues.

Both the Fowler bill and the Aldrich bill failed in the last Congress. In the meantime a new factor has entered the House of Representatives. Mr. Cannon of Illinois has been selected by the dominant party for the Speakership, and he is said to be opposed to any currency legislation at all. It is possible for him to organize the committees against currency reform. He may block the way for both the Fowler bill and the Aldrich bill. Another obstacle to currency legislation will be the hesitancy of the Republican leaders to take any definite step on the eve of a Presidential election. Against this inertia, born of timidity, the President's pushing, if he should push, might prove as ineffectual as his urgency for Cuban reciprocity was in the last Congress.

Yet the President's suggestion is backed by a considerable public demand for what is commonly called "emergency circulation." This term is not clearly defined in the minds of those who use it. Emergencies are of all kinds and dimensions, and may occur at any time. They may be of considerable importance and urgency without attracting any public notice. They may be coincident with the harvest season—they most commonly are—but they may come midway between two such seasons. If there be such a thing as a normal circulation, any deviation from it is an emergency, greater or less. Therefore, those who desire an emergency circulation should ask for one which will be responsive to all the variations of demand for currency, large or small, and that is what the Fowler bill and other measures proposed for "assets currency" seek to supply. Yet the popular desire for an emergency circulation does not go quite so far. It has in contemplation only the larger emergencies, the more pressing demands, such as the harvest season or an unexpected panic brings.

Most bankers and even some economists would draw a line between normal and emergency circulation by imposing a heavy tax on all note issues in excess of 60 or 80 per cent. of the bank's capital. They would allow banks to discount commercial paper to the extent of four or five times their capital (as they generally do), provided the liability so incurred is in the form of deposits. They consider a bank's liability in the form of notes far more dangerous to the bank itself and to the community than the same liability in the form of deposits. This is a superstition handed down to us from a former generation. In fact, the note liability is less dangerous to the bank than the de-

posit. The danger in either case consists in the chance of a demand for payment made suddenly and unexpectedly. In every emergency the notes lie scattered in the hands of the public. The very occasion which calls them out is a demand for purposes of circulation. So long as the emergency lasts, it will be difficult to collect notes for presentation at the bank's counter. Deposits, on the other hand, exist in solid masses. They can be drawn *en bloc*. In times of emergency they are liable to be so drawn. The bank, if called upon to pay its deposits in an emergency, would be very glad to have its customers drawing its notes instead of depleting its reserves of legal tender. A check drawn for $100,000, for example, if paid in cash, weakens the bank so much. If paid in the bank's notes, there has been a mere change in the form of liability, which can have no disturbing effect on the cash reserve until the notes have performed their office in the circulation and returned to the bank, which will commonly be some weeks later. Therefore, the theory that any note issues in excess of 50 per cent. or some other per cent. of a bank's capital ought to be heavily taxed is based on a misconception, or on popular doubt as to whether all banks would use their new powers wisely and conservatively. Yet it will probably be found in the foreground of any legislation for "assets currency."

OUR CHAOTIC FOOD LAWS.

Professor Wiley's report on his "poison-squad" experiments is not to be made public, it seems, until October. But last week, in an address at St. Paul, he made it pretty plain that they have only confirmed the position of the German Government—namely, that the use of food preservatives is harmful to health. Some preservatives, at any rate, Professor Wiley admits to be "deleterious," and he urges legislation, both national and State, to prevent food adulteration and the use of pernicious preservatives.

The safeguards provided by the new law against impure or falsely labelled foods and wines imported from abroad are, indeed, in striking contrast with the inadequate and confusing statutes which are supposed to protect us from adulterated and injurious food products at home. By the act which went into effect on July 1, the Secretary of Agriculture is clothed with authority to confiscate any shipments of objectionable foreign foods at the Custom House, although, in the Attorney-General's opinion, his jurisdiction does not apply to such as are imported in the pure state, and adulterated or falsely branded afterwards. It is a law which, wisely and thoroughly enforced, should shield effectually the customers of the "fancy grocery store."

Meanwhile, how do we stand with reference to domestic products, compared with which imported food is trifling in quantity? Many of the States, especially in the East, have food laws. Some have good laws, earnestly enforced; some good laws with no machinery to carry them out; some lax laws, and some no laws at all. There is no uniformity except in so far as the States have copied one another's statutes. It is a remark of Professor Wiley, Chief of the Department of Agriculture's Bureau of Chemistry, that a food manufacturer requires the services of a lawyer to see that the laws of the different States are complied with merely in the matter of printing labels. Take the case of a jam or a jelly containing glucose in place of cane sugar: in Ohio or Massachusetts its label must show the exact proportion of each ingredient according to analysis. In Minnesota, the label "adulterated mixture" must be affixed to this same jam, in Pennsylvania "compound," and in Illinois "imitation." In New York State, the law can be complied with by the declaration in fine type around the edge of the label in the guise of an ornamental border that the preserve "contains a small amount of corn syrup [glucose] to prevent crystallization." It is often illegal to sell in one State a product which was put up in strict conformity with the law of its next neighbor.

Toward remedying this chaotic condition, Congress has done almost nothing. The Hepburn National Pure Food bill, which passed the House last winter, reached the Senate late in the session and died there. At the demand of the dairy interests, however, a discriminating tax was placed on oleomargarine colored as butter is colored, though this is a perfectly wholesome article of food. Protection against one form of deception is also afforded by the act which makes it a misdemeanor to introduce into any State a dairy or food product falsely labelled as to the locality of its production. This law was introduced by Representative Sherman of this State, and was designed especially to prevent the branding of cheeses produced elsewhere, as the famous "New York full cream cheese." So far as the national law is concerned, it makes no difference whether the product is or is not really a full cream cheese, provided it were made in New York.

The fortified wines, then, the borax-preserved sausage, the reimported cottonseed oil masquerading in the guise of "pure olive," and the French peas colored with copper, Congress is resolved to keep from our tables. It does not concern itself with the "pure maple sugar" which never saw a maple tree, the "comb honey" made of paraffin and the indispensable glucose, the low-grade flour whitened with alum, the dilute acetic acid which passes as vinegar, the red wood and charred peanut shells in spice boxes, or the strawberry jam made of flavored and tinted glucose and gelatin mixed with timothy seed, all of which are domestic products. The workingman may be sure that his *petits pois* and cognac are all that could be desired, however much doubt there may be as to his bread and salt.

The consumer of impure food is cheated even when he is not poisoned. If he wishes to economize by using oleo or the euphemistic "corn syrup" on his table, that is his own concern, but it is unfair to both manufacturers and buyers if these things can be put on the market as maple sugar and butter. If all the States had good food laws and enforced them, a national law might be unnecessary. As it is, one of the chief difficulties of city health departments is to hunt down the impure food products brought in from other localities. It is comparatively easy to hold the manufacturers to account, and a single rigid inspection of a factory may result in keeping back from the market large quantities of deleterious food products. It is a very different matter to seize a half-dozen packages of this same food at a corner grocery store, and then throw the responsibility back upon the maker who may have violated no law of his own State. The national statute would not only stop shipments of the harmful commodities from one State to another, but would also furnish a model for those States which have not yet passed food laws of their own.

KNOWING ABOUT THINGS.

President Eliot has published his notable address, "The New Definition of the Cultivated Man," in *Science*. This choice of a medium recalls the late Gen. Francis A. Walker's assertion that his scientific graduates of the Massachusetts Institute of Technology were as liberally educated as the average college man, while it emphasizes President Eliot's well-known views on the value of science in culture. From his main theses, that culture depends upon a proper balance of interest between nature and man, that it presupposes some knowledge of science, and some acquaintance with languages and literatures, no dissent is possible. His view of the availability of the whole "store of knowledge," however, is more questionable. He points out how until recent times the idea of an all-round education has been cherished. To-day, says President Eliot of the whole store of knowledge:

> "It is too vast for any man to master, though he had a hundred lives instead of one; and its growth in the nineteenth century was greater than in all the thirty preceding centuries put together. . . . Culture, therefore, can no longer imply a knowledge of everything—not even a little knowledge of everything. It must be content with general knowledge of some things, and a real mastery of some small portion of the human store."

Obviously, these words are intended to apply to collegiate education. They

imply, first, a law of sacrifice—limitation of studies; second, a law of concentration—mastery of one. As regards life as a whole, both laws are a truism; as regards college studies, the law of sacrifice is an illusion, and the law of concentration a fetish. That is, in any proper interpretation of the words, the college student may still take all knowledge for his province, while it is equally true that in his college years he may not hope to attain mastery of any one subject. The paradox is only apparent. Whatever have been the ramifications of special research, the liberal and exact sciences are still reducible to a few types. It has not yet come to the point that we cannot see the forest of the Muses for the trees. No complete enumeration of studies is necessary here, but it is plain that under mathematics, physics, chemistry, biology, geology, and botany, language and literature, history and economics, psychology, ethics, philosophy, the main types are compris ed. It is needless to say that any subdivision of any one of these subjects is a field for a life work; but it is equally true that a reasonably clever lad can study something under each head and learn, in a school and college course, what a cultivated man needs to know about the great divisions of human knowledge.

The difficulty is that educators will not admit the value of knowing about things. They remember the Misses Bertram of Mansfield Park, who knew little more than the rhymed chronology of the British Kings, and insist upon real knowledge. That they take to be, for example, the knowledge which a lineman, an Edison, or a Lord Kelvin has of electricity. But little of that, from the point of view of college education, is real —that is, reasonably attainable—knowledge. Our student knows sufficiently about electricity when he has a general acquaintance with its theory, and has seen or even made a few typical experiments. The professor who cannot teach a class as much as this in a few weeks is unworthy of his pittance. This modicum of electrical instruction, if it is given understandingly, will enable the student to know what the linemen, Edison and Lord Kelvin are about. An electrician would need to know vastly more; no cultivated man should know less.

So all studies, if they be taught in their broader and more philosophical aspects, are at the student's disposal nearly as much as they ever were. On the other hand, no study can possibly be mastered by a student in the college years. Take the most favorable case: every student before the elective and group systems had been invented knew something about Latin literature. Would the most optimistic professor in Harvard itself assert that the young man who in school and college had passed his eleven years of Latin, really *knew* Latin literature? With a reasonable concentration we have no quarrel, but the "mastery" of which President Eliot speaks comes certainly not in the college, and hardly in the professional school; it comes only in the greater university of the world, and it may be regarded rather as a product of culture than as its condition. In college one is fortunate to get so much as a clear inclination for mastery along a definite line.

Clearing our mind of misapprehension as to the unwieldiness of the store of knowledge, and of impractical ideas about "mastery," we come to the real problem of college education, which is: Shall something be taught about many things, or somewhat more be taught about a few things? It is at bottom a choice between an education of larger or smaller scraps, and there is no reason for assuming that the larger scraps afford the better mental pabulum. No gourmet would commend a dinner which, at the sacrifice of bread, olives, and salad, offered heroic portions of pudding and roast beef. But we fear that education is in danger of yielding to some such fallacy. Where the student has any marked bent for a single branch of study, he may perhaps safely choose for himself; only the smallest part of our undergraduates have it in any pronounced form. They will drink of the Heliconian fount, but you must coax or flog them up to it. Under these conditions, does it not seem likely that the old discursive ideal of an education including all the main branches of human learning is still of value?

No sensible person would look over an audience of the engaging young men who fill our colleges and find the audacity to bid them achieve "mastery" by senior year. Should he tell them that they were to learn about a great number of things and so far as possible were to draw upon the whole store of knowledge, he would set forth an ideal at once pedagogically practicable and likely to attract the ever generous and curious imagination of youth. But no such appeal will be made until persons of academic importance see that, while to know things is the privilege of a few, to know about many things is valuable for all of us—including even college students.

A LIBRARY OF LIBRARIES.

At the recent meeting of the American Library Association, Mr. George Iles, whose services to critical cataloguing have won him the gratitude of many readers, made a plea, now published in pamphlet form, for a headquarters for the Association. By gaining such a home the Association, which now conducts an occasional dress parade, would organize itself into a working staff to direct and promote library interests throughout the country all the year round. Such an institution as a repository of all kinds of information on preserving and circulating books would be a library of libraries. Its usefulness will appear as its various departments are enumerated.

At headquarters would naturally be collected all manner of information about library buildings—photographs, plans, and description of furnishings. Thus a great number of examples to follow or to avoid would be furnished to library committees; and in order that the profusion of material should not cause bewilderment, the central officials would appraise each building from the point of view of library economy, pointing out in detail its advantages and defects. In some of our greatest library buildings the architects have signally failed to grasp the practical needs of the situation. Clearly it would be well if, before putting pencil to paper, every architect with a library to build should first seek the fountain-head of modern library lore. Undoubtedly, the necessary materials would be sent on liberal conditions to those who could not make the pilgrimage in person.

In its department of administration the general staff would merely continue under more favorable circumstances the work already excellently begun by the American Library Association. Here one approaches mystery. The layman must be content to believe that the science of classification grows wider and deeper with the process of the suns, and he must accept on faith, too, that gentle moral suasion by which communities are weaned from the novelette and put upon adult diet of poetry, history, and biography. Again, the competing claims of book-stack and open shelves may not be weighed by the inexpert. But there is doctrine for all these matters, and a central authority alone could hope to build up a set of dogmas sufficiently flexible and exact to have authoritative weight. It is certain that the broad lines of library polity might be established by such a body, and many defects due to inexperience and the absence of authorities done away with.

Naturally, Mr. Iles spoke in behalf of the work with which his name is peculiarly associated—that of appraisal of books. This means, in short, that beyond the usual indications, library catalogues should briefly characterize each book and estimate its value. A good beginning has been made in Mr. J. N. Larned's creditable work, 'The Literature of American History,' but Mr. Iles looks forward to a time when all "working books" shall be thus appraised. As things are to-day, the average reader is helpless before the list of hundreds of titles under each subject head. A note on each catalogue card giving the character of the book would yield the assistance now necessarily imperfectly supplied by the library attendants. But evidently the preparation of such criti

cal notes requires expert skill and involves considerable expense. Probably no single library could afford to undertake it. A central library committee, however, could do this useful work for the country at large—issuing either the complete "appraisal" cards or pasters to be used on the present library cards. As literature accumulates upon all subjects, such evaluation becomes increasingly more imperative. It could be managed nowhere so economically as by a committee with specialist collaborators, which might reasonably hope to sell its cards and catalogues throughout the country.

Finally, the proposed general library staff might coördinate and control the work of library extension. "Travelling libraries" are already familiar to our readers. Circulating Art Exhibitions, composed of carefully selected reproductions of fine examples, have been inaugurated with success by several States. There is a comic suggestion about the "circulating lecture," but the thing itself is sensible enough. Carefully prepared lectures with the necessary lantern slides are sent about, and the lecture is read by a member of the local association. One might feel that it would be far better to select for illustration essays and printed lectures from standard literature; but as to the general practicability of the plan there is no doubt. At the central repository are kept slides and manuscripts, and the lectures are usually accompanied by a small collection of books on the subject of the course. Last winter, Professor Penhallow, from his headquarters at Montreal, thus conducted free lectures in fifty-one towns, villages, mining, and lumber camps throughout the Dominion. It is highly desirable that some skilled body should have the care of all such movements, for nowhere is half-culture more out of place than in popular education. The people fare ill when they exchange carelessness of the things of the mind for the sentimentality of the faddist or the vulgarity of the intellectual quack. In all these matters a committee of library extension might exercise a very tonic influence.

Mr. Iles saves to the last his estimate of the cost and conditions of an effective Library of Libraries. Some great central library must give it, if not house room, at least the freedom of the premises; and some benefactor or benefactors must start it with an endowment of a million dollars. When the usefulness of such an institution is once fully understood, we do not anticipate any difficulty on either score.

FREE TRADE AND PROTECTION IN ENGLAND.

LONDON, July 16, 1903.

England has for well-nigh sixty years pursued, alone among the civilized States of the world, a policy of free trade. In 1903 a Government whose special mission it has been to maintain the union with Ireland and to carry through the war with the Boers in South Africa, have proposed to the English people to reconsider their ways and to examine whether it be not expedient to adopt a protective tariff. This is the salient feature of English public life. With the personal and transitory aspects of a serious crisis it is not my intention to deal at all. Nor do I propose to restate the arguments used for or against a momentous revolution in the traditional policy of England; it is idle to repeat things which, thanks to newspapers and telegraphs, are as well and as soon known in New York as in London. My wish is to analyze some of the causes that have produced in England a revolution of opinion which is really strange, and presents the appearance, though only the appearance, of suddenness. It is fair to warn your readers that I look at the matter in hand from the point of view of one who, though not in any strict sense an economist, accepts the general doctrine of free trade, and, as a constitutionalist, is convinced that preferential tariffs are far more likely to dissolve than to increase the unity of the British Empire.

To what causes, then, are we to attribute the revival of the protectionist creed? They may be brought under three heads.

(1.) The so-called revival is, as often happens, in truth a survival.

When, some ten or fifteen years ago, the demand arose that free trade should be exchanged for fair trade, Dr. Dale of Birmingham, I am told, said to John Bright: "We shall have to fight the battle of free trade over again." The orator of the Anti-Corn-Law League dissented, and held that the nation had been converted from protection in 1846. "No," retorted Dr. Dale, "the protectionists were not converted, they were thrashed." For the accuracy of this anecdote I cannot vouch; but I am certain that the dictum of the Birmingham preacher contains a truth constantly overlooked by politicians. By a salutary fiction of public life, the voice of the majority is treated as the voice of the nation; but we are too apt to forget that a useful fiction is not the same thing as a fact. A defeated minority is not a minority which has ceased to exist; and even the majority of any party—in this instance of free traders—contains individuals who, though they assent to a particular course of action, as, *e. g.*, the repeal of the corn laws, do not necessarily accept the principles on which a policy is defended by its thorough-going adherents. This was certain to be the case as regards the repeal of the corn laws. It required no careful study of political economy to perceive the practical inexpediency of a tax on the bread of the poor which raised the rents of the rich; and common sense condemned fiscal arrangements which added bitterness to the almost inevitable hostility between poverty and wealth. The prophet or rhetorician who invented the nickname of the "dismal science," himself (if I mistake not) condemned protection.

Free trade, further, involves in itself a paradox. Every man engaged in business, be he farmer or merchant, knows, or fancies he knows, that if his own business were protected he would be the gainer. It takes some thought to realize that arrangements which would be a gain to each man separately, may bring loss on the whole nation. The benefits, in short, of protection are obvious; its evils, though real, are latent. Even when free trade was triumphant, there remained much latent protectionism, and the real converts to the doctrine of free exchange were naturally and reasonably obtained not so much by the force of argument as by the weight of authority. The economists of sixty years ago were convinced free traders.

(2.) A curious combination of circumstances has diminished the authority of economical experts, and has taken from the argument in support of free trade much of its rhetorical impressiveness.

The experts are no longer unanimous, they are no longer dogmatic and confident. We have heard much in the field of theology of the disintegration of beliefs, and of the scepticism of which this disintegration is the cause. It has been insufficiently observed that what is true in the sphere of theology holds good in other spheres of thought. Dogmatic systems of all kinds have, under the dissolving influence of absolutely free discussion, tended to break up. Bodies of economical doctrine have lost their coherence. When Mill pointed out that protection may, under peculiar circumstances, be a benefit to a country, he went far further than he intended or realized to shake the faith in free trade. When a later writer of eminence declared that there are no "fixed principles" in legislation, he fostered, whether he intended it or not, fundamental scepticism.

To ordinary men, dogmas and axioms are intelligible and attractive. General statements which are cut down by qualifications, limitations or exceptions are to the crowd unintelligible. It is, in short, confidence, not candor, which creates proselytism; the hesitation of teachers means the scepticism of disciples. Then, too, the state of the world has changed greatly during the half century. No one can blame Cobden and his associates for failing to anticipate the effect of steamships and telegraphs in bringing different parts of the world nearer together. Still less could any man be expected to foresee in 1845 the rise of great states such as United Germany or United Italy. The result, however, has been that some of the definite anticipations of free traders have met with disappointment. The example of England as a great free-trade state has not induced other nations to forego protection; and English farmers whose fathers were told that they would not suffer from free trade, know that, as a fact, the corn growers of Essex are compelled to compete with the corn growers of Illinois. It is hardly necessary to add that, in accordance with the most ordinary laws of human nature, whilst the inconveniences or the losses caused by free trade are vividly felt, the evils which flowed from protection are forgotten.

(3.) The revival of the protectionist creed has been encouraged by the actual course of English legislation during the last thirty or forty years.

Free trade is merely a marked illustration of the policy, so often successful and so constantly descried, of *laissez faire*. Now English statesmen—and this remark applies to politicians of all parties—have shown, rightly it may be in many cases,

less and less faith in the wisdom of leaving things alone; they have encouraged the natural tendency of all men, and especially of the poor, to rely for their prosperity or comfort not on self-help, but on State aid. Trade in labor has become, under the Factory Acts, a matter of State regulation. Year by year it has become more difficult to enforce the rigid principles of the Poor Law; hardly is the attempt made to restrain outdoor relief; wholly is the hope, certainly entertained by the reformers of 1834, that outdoor relief might entirely come to an end, given up. The politician would be deemed a madman who should avow that the Poor Law itself is a necessary evil, and an evil admitting of ultimate abolition. In Ireland the price of land is fixed not by the haggling of the market, but by courts and commissioners. The State, in effect, compels employers to insure their workmen against accidents, and leading statesmen hold out to artisans the hope of old-age pensions. Under the Agricultural Holdings Acts a tenant is not even allowed to make his own bargain as to the terms on which he will hire land. Many politicians listen with favor to the demand for a compulsory eight-hour working day; and the man who dares to say that the price of labor, like that of other commodities, depends upon demand and supply, who murmurs a word in favor of Malthusianism, or who hints that picketing may be an undue interference with individual liberty, is supposed to believe in obsolete shibboleths, and has assuredly no chance of securing a seat in Parliament.

It is not my business nor my intention to argue that all or any of the laws or ideas to which I have referred are opposed to the public welfare. Some of them, at any rate, are, in my judgment, beneficial. What I wish to bring home to the readers of the *Nation* is that these laws and ideas are all inconsistent with the doctrine of *laissez faire*, and all tend towards Socialism. One thing is certain: Socialistic legislation creates an atmosphere favorable to the growth of protection.

A change, then, of sentiment which is probably, however, not so widespread as it may at first sight appear, is not really sudden, but is the tardy result of causes which have been operating for more than a generation. AN OBSERVER.

GREEK ART AT THE BURLINGTON FINE ARTS CLUB.

LONDON, July 13, 1903.

A remarkable exhibition of works of Greek art, gathered almost entirely from private collections in England, is now open at the Burlington Fine Arts Club. The exhibition is due to the labors of an excellent committee, and especially to the taste and energy of Mrs. S. Arthur Strong (formerly Miss Eugénie Sellers). Mrs. Strong is also the author of the greater part of the excellent catalogue. In this work she was aided by Mr. Cecil Smith and Professor Furtwängler. Mr. G. F. Hill describes the coins, and Mr. Charles Newton-Robinson the gems, except in so far as Mr. Arthur Evans, Mr. N. Story-Maskelyne, and Professor Furtwängler describe the gems which they respectively exhibit, and Mrs. Strong for special reasons describes six gems. An illustrated edition of the catalogue, at the price of four guineas, is to be published by subscription. Of the hundred exhibitors all but five are English, and of the five foreigners two, Mr. E. P. Warren and Mr. J. Pierpont Morgan, are Americans. Mr. Warren exhibits sixty-two gems and thirteen other monuments of various kinds, while Mr. Morgan lends the exhibition eleven works, chiefly bronzes. The works exhibited cover the period from the close of the sixth century B. C. to the Augustan Age, and among them are some which would ordinarily be classed as Roman rather than Greek. But, as Mrs. Strong remarks, these works, if not actually of Greek manufacture, are the products of Greek artistic tradition, and should not be excluded from an exhibition designed to illustrate the life and influence of Greek art. Some Etruscan works also are included for similar reasons.

Almost every object exhibited is an exceptionally fine specimen of its kind, so that a selection of those that can be mentioned in a short letter must be made more or less at haphazard. One of the best known and most beautiful works of sculpture is without doubt the head of Aphrodite in the Petworth collection. Mrs. Strong does not hesitate to call this an original work by Praxiteles. It certainly is Praxitelean in type, and it may well be fourth-century work; but the execution, especially the treatment of the hair, differs so much from that of the Hermes of Olympia as to make the ascription of the Aphrodite to Praxiteles himself somewhat doubtful. Another work of exceptional interest is a "marvellously beautiful" head of a young girl lent by Mr. Warren. The head, which is of the purest white Parian marble, was found at Chios, and two slight sketches of it were published by Studniczka, with a brief description, in the Athenian *Mittheilungen*, 1888, page 188. As it is soon to be republished and discussed by Mr. Marshall, a detailed description would be out of place here. Mrs. Strong, in the preface to her catalogue, regrets the transitory character of Mr. Warren's collection at Lewes. It may not be improper to hope that this head, "the subtlety of which brings it near to the achievements of the Renaissance," may at some future time grace an American museum. Another treasure from Mr. Warren's collection is a fine marble statuette of Heracles, a copy of Hadrian's time after a work ascribed by Furtwängler to Myron. A beautiful late archaic Attic head of Aphrodite, lent by Mr. T. Humphry Ward, the superb bronze head of Apollo (Furtwängler, *Intermezzi*, pls. i.-iv.) lent by the Duke of Devonshire, a fine replica of the head of the "Westmacott Athlete" lent by Sir Edgar Vincent, and a remarkably fine example of a realistic head of the third century B. C., of the class formerly regarded as portraits of Seneca, deserve special mention. A large bronze statuette of winged Eros holding the socket of a torch in his extended left hand and springing forward with the toes of his right foot on the ground, is a fine example of the life of Greek art in the second or first century B. C. This admirable work was found at Boscoreale, and belongs to Mr. Morgan.

Unusual attention is attracted by a terra-cotta head of Zeus somewhat less than half life-size. It is said to have been found in Greece, and Athens is mentioned as the place of provenance. The description of this work is written by Professor Furtwängler, who says:

"It is a Greek work of the period of Pheidias (450-440 B. C.). Certain forms seem in the manner of Myron (the head, for instance); while, on the other hand, the infinite repose and still sublimity of the whole is rather in the spirit of Pheidias. . . . It may be conjectured that the head belonged to the model for a large statue. It is, in any case, by the hand of one of the first masters of Greece, and a work entirely *unique* in character; I know of nothing similar to or comparable with it."

The impression made by this head upon other beholders is by no means uniformly like that experienced by Professor Furtwängler. The composite nature of the work produces an effect of artificiality which arouses suspicion, and certain technical peculiarities, especially in the treatment of the hair at the top and back of the head, point to the nineteenth century after Christ as the most probable date of manufacture. The almost universal conviction among English connoisseurs is that the head is a forgery. This is, however, the only object in the entire exhibition which cannot be unhesitatingly accepted as genuine.

Among the small bronzes and miscellaneous objects exhibited are many of exceptional beauty and importance. Indeed, the standard maintained is so high that it would be useless to single out this or that specimen. The whole period from the sixth century B. C. to the Roman imperial epoch is represented, though much more than half of the bronzes exhibited (somewhat over one hundred in all) belong to the Hellenistic times. The terra-cottas are for the most part of the Tanagra period and style, and among them are some of the most charming specimens of that charming work. The vases (eighty-eight in all) are mostly black-figured and red-figured Attic ware, dating from 560 to 400 B. C. There are also fourteen Attic white lecythi and a few vases of other classes. One vase (No. 46) is a hydria with a representation of the "toilet of Aphrodite," in delicate red-figured style. This represents a class which Furtwängler has recently assigned to the Alexandrian period, though the date usually assigned is the end of the fifth or beginning of the fourth century B. C. Another interesting vase is an œnochoe covered with a white slip and decorated in black-figured technique with incised lines. Upon it is represented a tree in the branches of which a man is hiding from a lion and a boar that approach from either side. The work is of great delicacy and the representation realistic and true to nature. It is interesting to compare the figures on this vase with a small bronze boar and lion in much the same attitudes from Mr. Warren's collection. In general, it may be said that while the vases exhibited do not give a good idea of the entire history of Greek vase-painting and still less of vase-making, they are admirably selected specimens of the vase-painter's art at its best.

The coins exhibited are from the collections of Mr. Arthur Evans (1-211), Mr. John Ward (212-311), Sir Hermann Weber (312-428), and the Rev. S. A. Thompson Yates (429-437). Mr. Evans exhibits only coins of the western Greeks, and a few Cretan coins. No. 127 is a magnificent Syracusan decadrachm by the "new artist," the only other known specimen of which is

that exhibited (No. 432) by Mr. Thompson Yates. Mr. Ward's Syracusan series supplements Mr. Evans's most admirably. Among Mr. Ward's other coins, those of the Macedonian and Syrian kings are especially noteworthy. Greece proper is best represented in the collection of Sir Hermann Weber, though he also exhibits fine specimens from Sicily and Italy and other parts of the Greek world. All the coins exhibited are fine specimens, and they belong, with few exceptions, to the period when Greek coinage was at its best.

The exhibition of engraved gems covers the long period from the "Mycenæan" era to the Augustan age, and even later. Mr. Arthur Evans contributes a case of 152 gems ranging in date from 3000 B. C. to Antoninus Pius; Mr. Story-Maskelyne's seventy specimens represent various stages from "island stones" to the time of Augustus; and the gems contributed by Mr. Cook, Professor Furtwängler, Mr. Newton-Robinson, Mr. Wallis, and Mr. Warren are for the most part, though by no means exclusively, Hellenistic and Roman. The new light which Mr. Evans's excavations at Cnossus have thrown upon pre-Hellenic civilization lends especial interest to the earlier gems here exhibited, but no student of the gem engraver's art could fail to be interested in the Asiatic gems contributed by Professor Furtwängler, and the remarkably fine specimens of Greek work in Mr. Warren's and Mr. Evans's cases. The entire exhibition of gems repays minute examination and is most instructive.

There are many miscellaneous objects which deserve careful study, but which cannot be mentioned here. The large cameo, however, formerly in the Bessborough collection, representing the heads of Claudius and Agrippina, cannot be omitted, for this superb work, showing clearly the Greek spirit animating the artist who represents the imperial Romans, is alone a complete justification of the course of the committee in including Roman works in an exhibition of Greek art. It may be well to mention also that three colored casts of fragments of stucco sculpture from the palace at Cnossus and a series of Cockerell's drawings are shown.

This exhibition is exceedingly popular, and the room of the Burlington Fine Arts Club is crowded by midday. It is to be hoped that this success will lead to further efforts. There are many works of Greek art hidden away in private houses, where they serve no useful purpose except as they may give their possessors an occasional moment of pleasure. If these could be occasionally exhibited in London, the gain would be—from this year's exhibition it already has been—great. Perhaps it is too much to expect that a loan exhibition of Greek art can be arranged anywhere in the United States, but there are some interesting monuments in private possession in America, and it may be permitted to hope that at some time and in some way they may be made of use to others than their owners.

HAROLD N. FOWLER.

Correspondence.

THE SOPHISTRY OF OPPRESSION.

TO THE EDITOR OF THE NATION:

RESPECTED FRIEND: In *Harper's Weekly* of the 11th instant, the editor defends and augments the popular clamor for the disfranchisement of the negroes in the United States in these terms:

"A repeal of the Fifteenth Amendment would leave the suffrage where the Constitution originally placed it, to wit, in the hands of the States. Such States as chose might give the suffrage to the negroes, just as they can, if they choose, give the suffrage to women. In those States which should withhold the suffrage from the negro, he would be no worse off than women are in all except four of the States. . . . The withholding of the suffrage would not deprive the negro of civil rights which are enjoyed by women in most of the States. His position would be precisely analogous to that occupied by many white men who lacked the property qualification which was prescribed for the franchise in most of the Northern States for many years after the formation of the Union."

If the editor had given the subject a moment of impartial reflection he would have perceived that a disfranchised race is in a very different position from that of the disfranchised women of a governing race. A disfranchised race necessarily involves a subject race and a governing race which is possessed of irresponsible power in respect to the disfranchised race. In other words, a disfranchised race, in a republic, is a race in a state of vassalage. But the women of each race are an integral factor of the race. The interests and the welfare of the women and of the men are identical and inseparable, and therefore the enfranchisement of the men of any race is virtually the enfranchisement of the women also. It is plain that the men and women of the same race bear a radically different relation to each other from the relation between two races. Possibly it would be better if women had the privilege of voting with the men; but, in the present order of things in the world, the men of each race are the public representatives of the race; and when a nation is composed of two distinct races, to deny the men of one of those races the right of representation in making and administering the laws that govern the nation, is practically to condemn that race to servitude. A little consideration would also have shown the editor that a property qualification for voting involves radically different principles from the disfranchisement of a race.

We are told in the same article:

"Nothing but the growing frequency in the Northern States of the new negro crime—by which is meant the crime against white women—and the conviction that this crime is due to the notion of political and social equality implanted by the gift of the suffrage, is likely to cause such a revolution of Northern sentiment as to lead to the wholesale disfranchisement of the blacks on the ground of their race or color."

Of course this only means that, except for the crime in question, the repeal of the Fifteenth Amendment would probably result in disfranchising the negroes in the Southern States, but not in the Northern. As nearly all the negroes are in the Southern States, the suggestion has very little significance, except in regard to this crime. On the other hand, there is not a scintilla of valid evidence that the enfranchisement of the negroes is the cause of this crime. It is not a crime of sentiment, but of brute lust and sensuality. It is not the result of exercising the intellect on political and social problems, but of giving an unbridled license to the animal passions. We are told by a Southern correspondent in *Harper's Weekly* of the 18th inst. that this crime was unknown in the days of slavery. This being so, it is clear that it is a result, not of the privilege of voting, but of emancipation. It is the result of the restraints of slavery being removed from a few extremely depraved and brutal human beings. Although the criminal may have been born since the system of slavery was abolished, he has inherited his brutal nature from brutal slaves, and that nature is now free from the restraints of slavery. To a superficial mind it may seem that the obvious remedy is a return to the system of slavery. But slavery is not a remedy at all. Slavery is only the covering of ashes which keeps a smouldering fire from breaking forth into a consuming conflagration. There is but one remedy, and that is the development of self-respect and self-restrained manhood in the negroes. This has been the only possible remedy from the beginning; and now it behooves the white people of the United States to examine themselves to see what they have done, and are doing, to promote, or to hinder, the development of self-respect and self-restrained manhood in the negroes. If the white man has yielded to false pride and prejudice and insisted on the negro's maintaining an attitude of obsequious servility, then let the white man remember that just so far as he has done this the guilt of the unspeakable crime in question is branded on his own forehead.

ISAAC W. GRISCOM.

PHILADELPHIA, 7th mo., 24th, 1903.

THE TEACHERS OF THE MOB.

TO THE EDITOR OF THE NATION:

SIR: Your article, "The Lynching Madness," brings up with uncomfortable force the suggestion that perhaps the blame for such a disgraceful moral level must be very widely spread.

When the war with Spain was threatening, a suggestion that the killing of Spaniards by the hundred was a poor way to obtain redress for the wrong of the *Maine*, when the Spanish Government had offered to make most humble amends, was met with scorn, and the advocates of war cried aloud for blood—for the spilling of blood in order to make our nation respected among its sisters. After Spain had been defeated, the claim that in trying to conquer a foreign people we were breaking with some of our oldest and best traditions, were violating the Declaration of Independence and the principles of our own Constitution, was met, as you have said more than once, by the boast that we had outgrown the Declaration of Independence; and even if it were against the theory of our Government, "We will do it anyhow."

If, then, we as a nation have thus departed from some of our most valued precedents; if we as a people have deliberately trodden upon some of our most honored laws, and have refused to abide in peace with a weak neighbor ready to make all possible reparation, can we expect to avoid the blame and disgrace that must follow? Are we reasonable to expect that such example, set by the nation, will not be followed by the masses?

How much is the man of education or of high social or business standing, who has

approved such revenge and justified such lawlessness, above the ignorant mob howling for the life of the wretch? Has the citizen, has the official, who justifies the torture of a man who sees fit to struggle, in his own country, for that country's liberty, a shadow of a claim to superiority over the degraded lynchers who descend to the level of cruelty found in the savage Indian? The mob seems to have learned well the lesson taught by its betters—if *betters* they may still be called.

Yours, etc., F. J. Le Moyne.

Isham, Tenn., July 21, 1903.

THE WAR FOR THE UNION.

To the Editor of The Nation:

Sir: In your issue of the 16th inst., in an article on "Political Agnostics," you say: "Our fathers went into that death struggle [the war for the Union] not merely to make an end of slavery, but to guarantee to the emancipated slaves every opportunity which a land of freedom can offer to any man."

I am sure that no one who remembers the political contest of 1860 and the succeeding events culminating in war can agree that "our fathers *went into*" that struggle with any intent to free the slaves or guarantee them anything. If the South had been overcome in the ninety days Secretary Seward talked about, or had not put up so stiff a fight, "our fathers" never would have approved the emancipation policy about which President Lincoln delayed till he could be sure he had the country with him.

Any one who sympathizes with you in the stand you are taking against the disfranchisement of the negro must wish that you had not mistaken the post-bellum sentiment of the North for that which existed before the war.—Yours very truly,

Gorham D. Williams.

Boston, July 20, 1903.

[Our expression was too loose. Objects and means alike changed as the war proceeded. At the close of hostilities there was a general agreement that the complete extinction of slavery was necessary to prevent a recurrence of civil strife. Hence the Constitutional guarantees and the investment of the freedmen with the suffrage. After the lapse of nearly forty years, it becomes clear how superficial was the Northern anti-slavery sentiment at large which sustained Lincoln in his emancipation proclamation. Moral convictions and moral fervor are not easily transmissible from generation to generation. It must be now apparent that the homage hitherto paid to the Declaration of Independence owed more to the spectacle of the Revolution—to sires who "fought and bled"—than to any real comprehension or acceptance of the doctrine of liberty, equality, and fraternity.—Ed. Nation.]

THE SUFFRAGE AGAIN.

To the Editor of The Nation:

Sir: The remedy for the many evils flowing from a democratic form of government is to be found, according to Mr. Edwin B. Smith in a recent communication to the *Nation*, "not in less, but in more democracy." However political theorists may view the proposition, it is manifest that the average American—the man in the street—does not crave further extension of gratuitous suffrage. He doubts the wisdom of thrusting the ballot on the negro in the past; he is opposed to its extension to the Filipino without positive evidence of fitness; he scrutinizes jealously the political qualifications of the "greasers" in Arizona and New Mexico, and probably sympathizes (at least covertly) with the efforts of the South to limit the voting power of the ignorant and irresponsible blacks. He feels that we have been very generous in the past, and that it is about time to call a halt.

It has often been alleged, and taken for granted, that these views were held exclusively by the so-called upper classes, the "silk stocking" element of society. Careful study and observation for many years has convinced me that this is an error. I have had the good fortune to know personally and intimately a large number of workmen in the South Chicago steel mills, living among them, working beside them at the furnaces, carrying my tin dinner-bucket and standing my night shift with the rest. The skilled workman, as I have found him, is a thoroughly wide-awake, tolerant, sane, and conscientious man, with a large measure of self-respect and pride in his work. Abstruse speculations are not his forte, but what he sees with his own eyes and hears with his own ears he feels that he knows. The man who can roll a rail, build a boiler, set up structural iron for a bridge, a furnace, or a ship, has a low opinion of the man the sum total of whose skill and ambition is to shovel hematite into an iron barrow year after year, while the plant is enlarging and the company is hunting high and low for good men. Perfectly willing to extend the glad hand to the man who does ascend from the ranks of unskilled labor, the skilled workman counts him a nonentity until he does rise. In councils of the men looking to adjustment of hours of labor, wages, and similar matters the opinion of the unskilled laborer is not considered. He simply does not count. He has no vote, and nobody would dream of thrusting one on him. If he knows still less about the American Government than he does about the steel mill, why, argues the skilled workman, should he have a voice in its management, especially if "he can't talk United States"? In no association of men, partnership, or corporation, large or small, for pecuniary profit or otherwise, would the opinions of men notoriously and palpably unfamiliar with the work in hand be considered of equal moment with those whose antecedents and training enabled them to form more intelligent opinions. The workman applies the same common-sense principles to political matters that he applies to his daily life.

The skilled clerical workman holds the same views regarding suffrage as does the skilled manual workman. The man who makes a living by adding up columns in a ledger, drawing way-bills, buying and selling land for a principal, or putting up prescriptions, holds equally decided (and identical) views, based on personal experience and observation.

It is true that the schools, public and private, are doing much to prepare the coming generation for citizenship, but it is equally true that there is a numerically large class of people who unfortunately, through no fault of theirs, have never had the advantage of American schools. There is also a large class, especially in large cities, who through degeneracy have never availed themselves of such opportunities for improvement as came in their way. No man in his senses who has first-hand acquaintance with these classes would maintain that the South Clark Street bum or the ignorant laborer (infinitely his moral superior) who makes a scanty living on the iron-ore, salt, gypsum, coal, and lumber docks of South Chicago, is a capable judge of the learning, temperament, and character of rival claimants to the bench of Cook County. They may happen to vote right occasionally, but the considerations that move them and the arguments that appeal to them are not those contemplated by our political forefathers, and are not those that make republics successful.

The conviction is slowly shaping itself in the minds of intelligent wage-earners that mere physical existence is not a sufficient qualification for suffrage; that what is needed is some positive proof of suitable mental equipment, some actual demonstration of reasonable fitness, some common-sense application to the question of suffrage of the universally recognized business principles of every-day life. E. L. C. Morse.

South Chicago, July 20, 1903.

ALGER FIRST, THE REST NOWHERE.

To the Editor of The Nation:

Sir: While there are some things connected with General Alger's administration of the War Department which are still unknown, there are some things which are very definitely known. In view of the things which are known, the following extract from ex-Senator John M. Thurston's speech in Detroit last week deserves a permanent record in your columns. For its kind of measured accuracy it is unsurpassable:

"Blind as bats in the serene sunshine of his success, they have swarmed in the darkness and flung their puny ink-blots at the shining splendor of his stainless shield. But the country knows, and the world knows, and impartial history will declare, that the war administration of Russell A. Alger stands first in all the annals of recorded time."

J.

July 19, 1903.

THE AMERICAN PHILOLOGICAL ASSOCIATION.

To the Editor of The Nation:

Sir: Many members of the American Philological Association will be sorry to read, in your report of the recent meeting, that the proposition to change the annual meeting from July to "Convention Week" was voted down. July is an impossible date for anything more than a mere fraction of the membership. Not one in eight attended the recent meeting. The New England States themselves have considerably more than twice as many members as the total attendance of that session, and New York and New Jersey number about as many more. Many of those in attendance were

from more distant places, so it is safe to assume that not one in five of those located in the States named found it convenient to attend. I have seen no statistics of the postal-card vote taken some months ago, but the pitiable, meagre attendance of recent years certainly suggests the advisability of making the change.

A MEMBER OF THE ASSOCIATION.

July 24, 1903.

Notes.

Original articles by Booker T. Washington, Professor Du Bois, C. W. Chesnutt, and T. Thomas Fortune, combined under the title, 'The Negro Problem,' will be published by James Pott & Co.

'Arnold's March from Cambridge to Quebec,' a critical study by Prof. Justin H. Smith; and 'Francis Adrian van der Kemp, 1752-1829,' an autobiography, edited by Mrs. Helen Lincklaen Fairchild, are just issuing from G. P. Putnam's Sons.

'Thomas Moore,' a biography in the English Men of Letters series, by Stephen Gwynn, and 'The Foe of Compromise, and Other Essays,' by William Garrott Brown, are forthcoming from Macmillan Co.

Benziger Brothers of this city have nearly ready a translation of the best encyclical letters of the late Pope, with a preface by the Rev. John J. Wynne, S. J.

Dr. John Louis Haney of the Central High School, Philadelphia, has printed privately 'A Bibliography of Samuel Taylor Coleridge,' of which a feature not obviously implied in the title is a list of more than 340 volumes annotated marginally by the poet, with indication of their present whereabouts when known. "Political Tributes" is another section, along with "Parodies and Imitations" and "Portraits." The edition is limited, in two forms.

The Library of Congress has issued a "Calendar of the John Paul Jones Manuscripts" which came to it in the collections of Peter Force. This calendar, prepared by Charles H. Lincoln, is extremely full, and pays particular attention to names and places. So far as the summaries of the documents are concerned, the work has been well and thoroughly done; but the index is very clumsy, due to excessive minuteness and bad arrangement. The volume contains an excellent reproduction of the Houdon bust of Jones.

'Westward Ho!' in two volumes continues the Library Edition of Charles Kingsley's Novels, Poems, and Memories undertaken by J. F. Taylor & Co. of this city. Raleigh, Elizabeth, and Sir Richard Grenville are the genuine historical illustrations. The Dent-Macmillan Thackeray proceeds with 'The Great Hoggarty Diamond, etc.,' and 'The Adventures of Philip,' in two volumes. Besides Mr. Brock's designs, there are the curious crayon portrait sketch by Samuel Lawrence, and Maclise's group of Fraserians, including Thackeray.

In the Dent-Macmillan "Temple Classics" John Healey's Elizabethan translation of St. Augustine's 'City of God' fills three volumes, with as many photogravure frontispieces after Botticelli, Fra Angelico, and Fra Filippo Lippi. This version, with all its scholarly shortcomings, held the field alone for two centuries and a half, and is now a monument to its English as much as to St. Augustine.

"The Temple Bible" (Dent-Lippincott) adds, in the uncanonical field, the First and Second Books of Esdras in one volume, edited by Dr. Archibald Duff, who breaks a lance for the Apocrypha.

Since its first appearance in 1889, Professor Merriman's 'Treatise on Hydraulics' has been very considerably expanded in order to keep pace with the recent advance of hydraulic engineering. Its usefulness has been correspondingly increased, and the eighth edition (John Wiley & Sons) is valuable as a text-book for engineering students or a reference book for practising engineers.

The late convention of the National Educational Association in Boston was well provided with local information. Of Mr. Bacon's Boston Guide we spoke last week. Mr. Lindsay Swift compiled for Houghton, Mifflin & Co. a little volume entitled 'Literary Landmarks of Boston,' an almost house-to-house census of writers, great and little, deceased and living, arranged by quarters and streets, with excellent illustrations. "Boston" is found to stand for the Greater Boston, with a reach to Salem and Beverly. No portraits are given.

We read in the *Library Journal* that a new edition of the American *Library Association's* 'Catalogue of 5,000 Volumes' for a small library is undergoing a transforming revision under the direction of Mr. Dewey of the New York State Library, and will be ready for the St. Louis Exposition next year. In the same number (for June) is a paper by Bowdoin's librarian, Mr. George T. Little, describing his new domain, Hubbard Hall, and his adaptation of British Museum methods of compact storage for the less used books. Noticeable in this connection is Mr. William E. Foster's allusion, in his latest report for the Providence Public Library, to the books "which are discarded on account of being superseded." This "sifting process," of course, makes trouble when such books are called for, and also for the cataloguing department. The rational policy of exclusion finds expression in the current report of the Cleveland Public Library. "The purchase of new novels has been based upon written opinions of members of the reading committee, and the best reviews. No attempt has been made to meet the great demand for the popular novels of the day." Some help to the building up of a more permanent collection Mr. Brett finds in the much criticised reduction of discounts enforced by the American Publishers' Association. In connection with the Carnegie Library of Pittsburgh, the Cleveland Public has prepared an analytical dictionary and catalogue of children's books, to be printed at the expense of the former institution. The librarian of the John Crerar Library, Chicago, in his eighth report enumerates the advantages of the card system of the Library of Congress, yet doubts if, in place of his subscription for twenty-one copies of each title, he might not economize by subscribing for one to be used as copy by his own printer. The Crerar Library, by the way, has just published a supplement to its valuable 'List of Serials in Public Libraries of Chicago and Evanston,' corrected to April, 1903. The undertaking has abundantly proved its usefulness in unexpected ways. Thus, it has led to the completion of defective sets.

The Massachusetts Historical Society's sixteenth volume (new series) of Proceedings contains the record of meetings from March to December, 1902, as well as several papers of interest. Among these are the exhaustive account of the "Registers of Probate for the County of Suffolk," by the late John T. Hassam, and "The Historical Conception of the United States Constitution and Union," by Daniel H. Chamberlain. Of the Newburyport Diary of John Quincy Adams, from 1787 to 1789, furnished by his grandson, Charles F. Adams, we have already spoken. Other papers are "Some Early Religious Matters at the Piscataqua," by James De Normandie; "The Condition of Naval Affairs in Boston in 1812," by James F. Hunnewell; "Cotton's 'Moses and his Judicials,'" by Worthington C. Ford, and "A Glance at Suicide as dealt with in the Colony and in the Province of Massachusetts Bay," by John Noble. A series of letters from James Parker, one of the best-known colonial printers, to Benjamin Franklin, is communicated by W. Ford, together with some letters of Richard Lechmere, by Charles C. Smith. Remarks by Gamaliel Bradford on historic evolution in Massachusetts, by William W. Crapo on Gosnold's voyage, by Samuel A. Green on the Cardiff giant, and by Warren P. Upham on some rare books in shorthand, are reported in full. A biographical memoir of Lincoln Flagg Brigham, with portrait, is contributed by Solomon Lincoln, and there are informal tributes to the memory of Samuel R. Gardiner, James B. Thayer, Horace Gray, Charles G. Loring, and other deceased members. The frontispiece to the volume is a photogravure from a portrait of John Quincy Adams, painted by Copley in 1796, which reappears in Little, Brown & Co.'s reprint of the Diary.

The Geological Survey of Canada has recently published Volume XII. (new series) of its Annual Reports, comprising 972 pages, and containing 8 maps and 13 plates, as well as 29 half-tone illustrations and numerous figures in the text. It opens with a summary of operations by the director, the late Dr. George M. Dawson, which incidentally points out the pressing need of a new museum building for the collections of the Survey. Elfric Drew Ingall contributes a "Report on the Iron Ore Deposits along the Kingston and Pembroke Railway in Eastern Ontario." It gives the results of investigations undertaken with a view to ascertaining the quantity and the quality of available ore from immediately accessible localities in that district. The supply appears to be almost entirely magnetite, with some hæmatite or bog-ore. The district would probably yield 100 tons daily. "A Report on the Geology of Argenteuil, Ottawa, and part of Pontiac Counties, Province of Quebec, and portions of Carleton, Russell, and Prescott Counties, Province of Ontario," by R. W. Ells, describes an area of about 4,000 square miles. Incorporated with this report are the results of important exploratory work done nearly twenty-five years ago by L. R. Ord, but never before published. Dr. Ells also contributes a "Report on the Geology and Natural Resources of the Area Included in the Map of the City of Ottawa and Vicinity," containing

about 450 square miles, and most interesting from a geological standpoint. All the palæozoic formations are present, from the base of the Potsdam sandstone to the Medina, and most of these are highly fossiliferous. A. Osann's "Notes on Certain Archæan Rocks of the Ottawa Valley" deal with the principal types of gneisses and the technically important minerals apatite, mica, and graphite. In the "Report of the Section of Mineral Statistics and Mines" Mr. Ingall shows that the growth of Canada's mineral industry continues to be satisfactory. The increase of 1899 over 1898 amounted to nearly $11,000,000, or upwards of 28 per cent.

The Annual Report of the Department of Mines, New South Wales, for 1902, embraces reports from the Under Secretary for Mines and Agriculture, the Chief Inspector of Metalliferous Mines, the Chief Inspector of Coal and Shale Mines, and the Government Geologist. It appears that the aggregate value of metals and minerals produced in the State to the end of 1902 is £152,280,312. The value of the production for 1902 is £5,368,145, and falls short of that of the previous year by £368,490. This is attributable to the drought, one of the worst and most prolonged which have ever visited Australia, and to the low price of silver and lead. The coal-mining industry has made satisfactory progress, the value of the production amounting to £2,206,598.

The sum of $300 will be paid for accurate information indicating the present whereabouts (with permission to copy the same) of the MS. work, written by the Rev. Lewis Rou, entitled 'Critical Remarks upon the Letter to the *Craftsman* on the Game of Chess,' being a closely written, thin, small quarto of twenty-four pages, beginning with a dedicatory letter: "To His Excellency, William Cosby, Esq., Captain-General and Commander-in-Chief in and over the Provinces of New York and New Jersey." At the end of this dedicatory epistle is the date: "New York, ye 13th of Decemb. 1734," which date is virtually repeated at the end of the MS. This unpublished tract was, during 1858-9, for a while in the possession of the late Dr. George H. Moore, then librarian of the New York Historical Society, to whom it had been lent by the now unknown owner. Information concerning it may be sent to the Librarian of Cornell University, Ithaca, N. Y.

—The August *Century* is a number of unusual interest. Andrew D. White begins the reminiscences of his diplomatic career, dealing with his first mission to Germany, 1879-1881. Like Lowell in England, Mr. White found himself obliged to devote too much of his time to ambitious Americans wanting to be presented at court, seekers after fabulous fortunes supposed to be waiting for American heirs, Germans seeking to evade the requirements of German law through the aid of hastily acquired American citizenship, and the various other troublesome classes which international courtesy tends to create and international law has as yet found no way to abolish. Mr. White seizes the opportunity to plead for a better trained and more permanent diplomatic force, and incidentally expresses himself strongly against the proposal, so often agitated, to give our Cabinet secretaries a seat in Congress. He prefers to contemplate American Cabinet officers "sitting quietly in their offices, giving calm thought to Government business, and allowing the heathen to rage at their own sweet will in both houses of Congress." Alice Katharine Fallows describes in a very complete and lucid manner the great advance of the past three years in securing for New York city a healthful milk supply. Ray Stannard Baker contributes an article on the oft-described Yellowstone Park, and F. W. Stokes, the artist, gives an account of his voyage with the Swedish South Polar Expedition, which sailed from Gottenburg in the autumn of 1901. The article is accompanied by four color reproductions of the sketches which Mr. Stokes made on the spot. As the magazine is held in the hand the effect seems unnatural; but, seen under proper conditions of distance and light, one can easily imagine these pictures to be very lifelike representations of the marvellous polar sunlight. Professor Winchester finishes his admirable sketch of Wesley in this number, and the Editor, considering the wholesome effect of Wesley's preaching in breaking up smuggling, bribery at elections, etc., calls for another Wesley to lead the much needed ethical revival of the present age. The Walter Scott letters to Mrs. Hughes are also completed.

—'A Political History of Slavery,' by William Henry Smith (G. P. Putnam's Sons), is, according to the title-page, "an account of the slavery controversy from the earliest agitations in the eighteenth century to the close of the Reconstruction period in America." Mr. Whitelaw Reid furnishes an introduction and a short biographical sketch of the author, who was Collector of the Port of Chicago under President Hayes, but better known as an editor, and for having been for many years manager of the Associated Press. The concluding chapter, on "The Failure of Reconstruction," is by Prof. John J. Halsey. Mr. Reid, in his introduction, gives an account of the origin and purpose of the work. It seems that President Hayes requested the author to act as his literary executor and prepare an account of his life and times. The early part of Mr. Hayes's career brought him "into a centre of the anti-slavery movements which preceded the organization of the Republican party," and thus his biographer was compelled to study the political side of the genesis of the anti-slavery movement. The result is the present book, which is to be followed by the 'Life of President Hayes.' This, though left incomplete by Mr. Smith, will be finished and published by his son-in-law, Mr. Charles R. Williams. The present volumes go over well-worn ground, but Mr. Reid in his introduction mentions two points which he thinks gives the book its special claim to attention: first, that, in the view here presented, relatively small importance is attached to "sentimental agitations and agitators," and greater honor awarded to "those who, instead of brilliantly saying things that alienated support, soberly did things that compelled it," and, second, that the author "is careful to correct the notion," set forth by Mr. Henry Wilson, that the anti-slavery sentiment in Ohio was chiefly due to the New England emigrants. The book is not controversial. The author merely devotes himself to showing the political agencies by which slavery was abolished, and the result is that we hear a great deal of Ohio and the Middle West, and the part played by Chase, Brough, McLean, Morton, Hayes and others, and almost nothing of the abolitionists or of anti-slavery literature, with entire neglect of the genetic relation between the moral anti-slavery agitation and the first political organization. This is one-sided "history." The book goes back to the eighteenth century, and seems to profess to deal with the slavery controversy as a whole.

—Since Townsend Harris, after study and collection of materials, gave up his idea of writing a book on Formosa, there has been little attempt in English in the way of description of this island, except the Rev. William Campbell's 'Missionary Success in Formosa' and the late E. H. House's 'The Japanese Expedition to Formosa,' both of which were reviewed at length in these columns. We have now, happily for those interested, a portly volume of nearly seven hundred pages, which, besides being crammed with information, is well illustrated and indexed. It is by James W. Davidson, Consul of the United States for Formosa, and issues from the press of Macmillan & Co. Among the eight-score or more illustrations are colored reproductions of two Chinese posters, and a frontispiece showing the peaks of Mount Morrison, now the highest in the Empire of Japan (13,880 feet). It is snow-clad and its slopes are abundantly timbered. Nitaka Yama, as the Japanese name it, is the lord of the range which dominates the whole island from north to south, precipitous on the ocean flank and with a long slope and wide littoral on the side toward Asia Most of the other pictures, except the reproductions from old Dutch books and a few Japanese and Chinese sketches, are modern photographs, clear, informing, and splendidly reinforcing the text. There is also a very well executed map in colors, on which the habitat of the different groups of savages in the eastern or ultramontane part, the railways, roads, lighthouses, harbors, towns, villages, seats of authority, and the districts once notorious for head hunting but now under complete Japanese control, are marked.

—In such an encyclopædic work, admirable for its wealth of information, one need not expect many literary attractions, yet the narrative of the Japanese invasion of 1874, of the short-lived Formosan Republic, and of the Japanese occupation of 1895, is spirited and interesting. Mr. Davidson pictures the "beautiful isle" under the Hollanders, 1514-1655 (the Dutch literary authorities here being abundant), the kingdom of Koxinga, 1662-1683, and Formosa as a Chinese possession and under mandarin rule. He goes into much detail about foreign intercourse and shipwrecks, showing that citizens of the United States were more than once held not only as captives, but as slaves, and how the landing of an American expedition in 1867, with a "fight in a furnace" among the bamboo jungles, resulted in another of the many disasters which were common to Western waifs or visitors until the Japanese occupation of 1874. The story of the French campaign of 1884-'85, and of the progress of the islanders under the Chinese, is told with fulness and fairness. Then comes the detailed story of the Chinese cession and costly Japanese conquest, followed by colonization, exploration, and

government, remarkable for economic and general success. This half of the volume contains good accounts of great industries, with their production of tea, camphor, sugar, gold, coal, petroleum, sulphur, and salt. Naturally the literary treatment of the aborigines and later inhabitants is left until the last, in order to utilize as far as possible the results of the explorations which are still in progress. The Japanese seem to have accomplished wonders, which the photograph will help the skeptical to believe. The details of administration, enterprises, and trade of the Formosa of to-day, with account of the birds, beasts, and climate of the wonderful island, are up to date, and the abundant, painstaking index opens easily the treasures of what will probably be the standard work for a generation to come.

—'The Story of General Bacon,' by Alnod J. Boger (Methuen), is the biography and vindication of a brilliant cavalry officer whose courage and professional capacity were admitted on all sides, but whose independence of spirit prevented him from rising to high rank in the British service. Anthony Bacon was a descendant in direct line of Anthony Bacon, the brother of Lord Verulam, and had for his father one of the richest commoners in England. His wife was Lady Charlotte Harley, the "Ianthe" to whom Byron dedicated "Childe Harold." The two things that caused Bacon most trouble and proved the greatest bar to his worldly success were an impracticable temper when dealing with superiors, and a total ignorance of the value of money. Constantly in debt from the day he entered Eton, he quarrelled with his father—or his father with him—whenever the day of reckoning came. The elder Anthony paid but growled, and finally left his first-born with an estate which was heavily burdened by provision for younger children. In 1812, at the age of sixteen, Bacon received a commission in the Sixteenth Light Dragoons, and saw considerable service before the close of the Peninsular War. At Waterloo he charged with conspicuous bravery, and was severely wounded. During the next seventeen years he devoted himself with considerable diligence to the theoretical work of his profession, and became convinced of the superiority which the single-rank system of cavalry formation possessed over that of the double-rank. Mr. Boger prints some interesting letters from the Duke of Wellington, Sir Hussey Vivian, and Lord William Russell to Gen. Bacon, in criticism and general commendation of his idea. When the war with the Miguelites began, Bacon joined the forces of Dom Pedro, and equipped a force of lancers which rendered important service to the Constitutional cause in 1832-1834. His share in this Portuguese war is the most striking part of his career as a soldier. Not only was he given a chance to carry out his theory of cavalry tactics, but he held his men together by a daring and generosity that appealed to their hearts. There can be no doubt regarding the value of the foreign troops to the Constitutional cause, or of Bacon's eminence as the best cavalry officer among the foreigners. Unfortunately he became involved in troubles with Saldanha, which led to his withdrawal from the Portuguese army, and the later part of his life was largely occupied with efforts to recover back pay, together with money which he had expended to keep his troops together. Though he had friends in the Duke of York and the Duke of Cambridge, Bacon never established himself in the good graces of the War Office. Thus, in spite of his recognized skill as a commander of cavalry, he had no part in the Crimean war. He was admired for dashing courage and personal beauty, but he was also impracticable. Mr. Boger is a grandson of Bacon, and possesses the virtue of complete sympathy with his subject. At the same time he is too uncritical, his constructions are very loose, and his use of the verb is not always accurate.

—'Wesley and his Preachers: Their Conquest of Britain,' by G. Holden Pike (London: T. Fisher Unwin; Philadelphia: J. B. Lippincott Co.), is one of many signs that the Wesley bi-centenary is upon us. It is to be hoped that this will give us something better than we had before, but it will be a difficult matter with such a careful life as Tyerman's and such a brilliant study as Julia Wedgwood's already in the field. If the quality of the harvest is indicated by such first-fruits as Mr. Pike's we shall be little richer when it is gathered in than we are now. What he has done, he has done with a view to speedily economizing the interest in Wesley appropriate to his great anniversary. The arrangement is topical, and under each head we have many particulars huddled together with little reference to their congruity or effective presentation. We have first "Some Characteristics of the Man," and much of the chapter is devoted to Wesley's opinions of his distinguished contemporaries. Whitefield, as "one of those who wore out fast," is compared with himself with comfortable self-satisfaction. In the second chapter we have a series of brief sketches of Wesley's more famous preachers. Other topics are "Travelling and Travellers," "Some Phases of Town and Village Life," "The Common People," "The Upper Classes," "Prisons and Prisoners." Wesley's credulity is illustrated by many examples under the head, "Belief in the Supernatural." We are less confident than Mr. Pike that our own time is less credulous than Wesley's. In general the touch is casual, the treatment superficial, and there is an absence of profound engagement on the part of the writer with his subject. Under the cover of these details the real greatness of the man and of his work somehow escapes our grasp.

A CONTEMPORARY VIEW OF RECENT FRENCH HISTORY.

Contemporary France. By Gabriel Hanotaux. Translated by John Charles Turner. With Portraits. Vol. I. (1870-1873.) G. P. Putnam's Sons. 1903.

This book belongs to that class of histories whereof the work of Thucydides is a famous example among the ancients, as the works of Philip of Commines and Lord Clarendon are among the moderns, viz.: a narrative written by a contemporary of events which passed in his own time, not in the form of a chronicle in which those events are entered as they happened, but in the form of a treatise setting them forth after a lapse of time sufficient to give some perspective. No kind of history is more interesting, none more instructive. The frequently erroneous impressions of the moment are avoided, while at the same time there is that perception of contemporary feeling, that comprehension of the leading figures as they actually appeared in the intercourse of daily life, which gives a sense of reality. True it is that eminent men are constantly misunderstood and therefore misjudged by their contemporaries. The newspapers, sometimes deliberately, more often unintentionally, misrepresent the characters and motives of the persons with whom they occupy themselves. Any one who has had opportunities of closely watching and personally knowing prominent actors in the politics of the day, is astonished to find how little the ordinary citizen who gets his notions from the daily or weekly press apprehends the truth about them. He credits them with merits they do not possess, and attributes to them motives very different from those which really sway them. Still, when allowance has been made for all this, a contemporary history, if produced by a vigorous and penetrating mind, has a kind of freshness and worth which the best writer who comes long after and relies upon the records of his predecessors cannot impart to his work.

M. Hanotaux is a good specimen of a type which has usually been well represented in France and England, and was at one time well represented in the United States also, the man of letters who is also a statesman, or at least a politician; the class to which belonged Royer Collard and Guizot and Tocqueville and Thiers, Burke and Maekintosh and Macaulay, and, in the United States, Jefferson and Benton, and in a sense even Alexander Hamilton. Trained in the French civil service, M. Hanotaux was some years ago Minister of Foreign Affairs for nearly three years. He is known in the field of literature by his elaborate work on the career and policy of Cardinal Richelieu, which secured his election to the French Academy. In the present book one discovers the diplomatist as well as the historian. The author understands how negotiations are conducted, and how much the personality of the envoy may affect the results of his mission. He has also seized the historical point of view, and thus can see in the minor incidents the larger issues involved and the general trend of events. One also discovers the practical politician, for many pages are dedicated to the debates in the French Assembly, and they are among the most interesting pages, because they present both the strategy of the leaders and the swift changes of feeling in an excitable body with that freshness and insight which spring out of familiarity with parliamentary life. As a rule, nothing is drearier than a record of debates when the excitement of the moment has passed. Here, however, the great issue of the form of government was constantly before a practically sovereign assembly. The magnitude of the stake gives importance even to the smaller moves in the game; and it was a game as full of sudden and unexpected alternations of fortune as if it had been determined by the turning up of good or bad cards on the table.

The period covered by this first volume extends from the meeting at Bordeaux of the National Assembly elected in February,

1871, to the fall of M. Thiers after the hostile vote of that Assembly on May 24, 1873. These two years were full of great events. There was the conclusion of peace with Germany. There was the choice of Thiers as "Chief of the Executive Power" and afterwards President of the (provisional) Republic. There was the insurrection of the Commune in Paris, the siege and capture of the city by the troops of the Assembly now installed at Versailles. There were the negotiations with Bismarck about the evacuation of the eastern departments by the German army of occupation and the raising of the prodigious sum (five milliards of francs) by which Thiers ransomed the territory. Finally, there were the incessant intrigues and struggles over the settlement of a definitive form of government for the nation; and in the midst of all these troubles there is the amazing revival of France, a revival of material prosperity, a revival of moral force and self-confidence. With what sort of spirit does M. Hanotaux treat these events? The patent danger to which the contemporary historian is exposed, a danger which Thucydides did not wholly escape and before which Lord Clarendon and Bishop Burnet succumbed, is that of seeing things with the eyes of a partisan. The author makes gallant efforts to be fair, and on the whole is fair, to the Legitimists and the Orleanists, although himself a Republican.

A Legitimist or an Orleanist would, no doubt, tell the story somewhat differently, yet one discovers no attempt to pervert the facts or ignore the good points of the leading men in the monarchical parties. When M. Hanotaux comes to speak of Bismarck he is naturally less on his guard, and uses language which a patriotic Frenchman resenting the misfortunes of his country would be inclined to use, though an historian of another nation would be more dispassionate, even when recognizing the harshness which the German Chancellor showed to the vanquished. Of England and English statesmen M. Hanotaux has little to say, and that little is generally unfriendly. Here and there one finds odd little mistakes. Bismarck is called a Pomeranian, whereas he belonged to the Mark of Brandenburg. To say that "Alsace had been claimed by Germany in the assignments which in 1556 followed the disruption of the empire of Charles V.," is a statement extraordinary as coming from the pen of a trained historian, the errors in which it would take many sentences to explain fully. One is less surprised to find (p. 401) the remark; "Others were inclined to borrow the income tax from England and America," for American finance is little understood in Europe.

The translation, though it is generally clear and fairly spirited, is far from perfect. Expressions are sometimes used which do not convey the real sense of the original, and other expressions are bald and scarcely intelligible Gallicisms. Some, indeed, scarcely belong to the English language at all. The rendering ought to be carefully revised in another edition.

The hero of this volume is Thiers; nor have we anywhere seen a more vivid and lifelike picture of the eager, restless, vivacious, untiring, resourceful old man who took the helm at a moment of incomparable difficulty, and steered France out of the breakers that seemed ready to engulf her. French opinion seems to think that M. Hanotaux has judged rather too severely the conduct of Thiers in yielding so much to Germany for the sake of securing peace, and in raising on such high terms the money which purchased the evacuation of the country by the Germans. This is one of the cases in which it is easy to see the evils of the course that was taken, not so easy to estimate the evils that might have followed some other course. Be this as it may, M. Hanotaux does justice to the splendid courage, the ardent patriotism, the invincible patriotism of the "little bourgeois from Marseilles," or, as Thiers called himself, "the little tradesman with the fiery soul." His vanity, his desire to make every one recognize his universal competence, his littlenesses (including his "senile penuriousness"), are admitted. But the brightness and keenness of his mind, his inexhaustible ingenuity in extricating himself from "tight places," his amazing range of knowledge, his adroitness in debate—all these receive the praise they deserve. His management of the Assembly was a masterpiece, and if he committed errors which ultimately brought him to the ground, one is less surprised at these than at the tact which, in a position of incomparable difficulty, was betrayed into so few. Thiers was not a party leader, like the statesmen of the United States and England. There was no body of adherents behind him. He had to play off the three monarchical parties against one another and against the two Republican sections, conciliating sometimes one party, sometimes another, with the knowledge that every advance in any direction provoked antagonism in all the others. Of the many anecdotes told of his lively sallies we have space for one only, which illustrates his boldness as well as his quickness:

"An acid-tongued Orleanist was saying in a group that M. Thiers had tricked his former friends, and that, in spite of his protestations, he aspired to the dictatorship. M. Thiers heard, drew near, and, addressing the malcontent, said: 'My good friend, one day King Louis Philippe wanted to make me join a ministerial combination which did not suit me. I held my ground; the King insisted. "You would like to make me believe," said Louis Philippe sarcastically, "that you do not care for office?" I was a bit annoyed, and I replied to the King, "Sir, on all the occasions when your Majesty has told me that you only accepted the burden of the Crown in desperation, I have always believed you" ' " (pp. 55, 56).

It was said of Thiers that he interested more than he attracted. His soul was not lofty, his character not one to win affection. He was not greatly trusted, nor perhaps deeply respected. But he had the energy, the versatility, the power of commanding attention by the unfailing radiance of his intellect, which the time needed, added to an unrivalled experience and the reputation of having been constantly right in his frequent criticisms—criticisms often repeated—of the policy of Napoleon III.

None of the other persons who figure in the book is described with so much care or fulness as Thiers; yet light is thrown on Dufaure, Dupanloup, Jules Favre, Buffet, Gambetta, Count Arnim, and above all on the Count de Chambord, an admirable counterfoil to Thiers, as immovable in his principles and line of action as Thiers was flexible and various. One reads of the Count's repeated refusals of the crown of France—for it was practically within his grasp, so far as the Assembly could bestow it—with a mixture of admiration for his conscientious firmness, and impatience with the folly which sacrificed nearly every thing that he and his friends held dear because he could not have quite everything. To him the tricolor was the symbol of revolution. Revolution was that against which it was his highest duty to protest; so, because he clung to the white flag, monarchy was not reëstablished.

One of the most powerful chapters describes the revolt of the Communards in Paris, a frightful sequel to the war, in which both the victors and the vanquished showed a reckless cruelty worthy of 1794. Here the most striking figure is the aged Delescluze, who, after passing most of his life in prison for conspiracies against various governments, met his fate on a barricade when Paris was captured—a typical specimen of the intense, unswerving, and (in a sense) high-minded doctrinaire fanatic. The men who figured in the Commune movement had mostly been trained in the earlier days of revolution, some in 1830, some in 1848 and 1849. Revolutions form the spirit which breaks out in fresh revolutions; so it is lucky for France that as thirty-two years have now passed since the last fighting in the streets of Paris, the habit of flying to arms is beginning to wear out, and those who retain the recollection of *émeutes* are getting on in years and less likely to disturb the public peace. If M. Hanotaux does not add very much to our knowledge of that deplorable episode of April, 1871, he treats it in a spirit of historical candor and fairness.

The volume is interesting from the first page to the last, and raises high expectations of the value which the work will have when it has been completed down to the year 1900. The difficulties will not diminish as our own days are approached.

CHADWICK'S CHANNING.

William Ellery Channing, Minister of Religion. By John White Chadwick. Boston: Houghton, Mifflin & Co. 1903. Pp. xvii, 463.

Mr. Chadwick's brilliant sketch of Theodore Parker had prepared us to look with anticipation for his brief biography of Channing, and this anticipation is in no way disappointed by the appearance of the volume itself. Though the author has less of sympathy with his subject than with Parker, and though Channing's personal qualities evidently attracted him less than those of the younger Boston minister, Mr. Chadwick's biography of Channing displays the same firmness of grasp of the historic situation, the same clearness and vividness in the delineation of the portrait which he makes central, and the same honesty of judgment regarding the virtues and defects alike of his subject, which marked his earlier biography.

Mr. Chadwick sketches briefly Channing's boyhood experiences at Newport and the little college world in which he found himself at Harvard, so unlike the experience of the university student at the present day. He makes evident the great significance for Channing of his Richmond tutorship, in his spiritual and reformatory development, and no less in the ruin of his health, which rendered him so largely an in-

valid the rest of his days. These topics lead, in natural chronological sequence, to a description of the provincial and self-centred Boston of Channing's early ministry and of the circumstances of his settlement over the Federal Street Society in the busy town of 25,000 inhabitants. The stipend of $1,200 seemed large to him in that frugal age; and Channing's Puritan conscience made him "afraid as ever of self-indulgence, and hence [he] took for his study the smallest room in the house, while a much better one was crying to be used, and for his sleeping-room the attic, which was ill-furnished, cheerless, cold, and every way ill suited to the condition of his health"—an asceticism which has almost wholly passed away in New England, but which continued, in a measure, even amid the extremely comfortable external surroundings of Channing's life after his marriage.

No portion of Mr. Chadwick's sketch is better drawn than that which pictures Channing's religious development during his early ministry and his relation to the Unitarian division. The author makes it evident that

"he arrived at liberal principles sooner than at Unitarian doctrines; that his larger and more characteristic thoughts anticipated the minor Unitarian expression. A noble confidence in reason, a fear of worse results from its repression or neglect than from its free exercise, distrust of theological precision as making for sectarian division, the insistence upon character as superior to creed, a lofty faith in the Eternal Fatherhood and in the dignity of human nature—such was the warp of his religion."

He justly lays emphasis on Channing's "devout biblicism." "It was because the Bible had no 'clear word of prophecy' about the nature of Christ and the Atonement that the liberals were vague and hesitating as to these matters; and Channing was so to a remarkable degree his whole life long." "He attained to liberality of temper while still semi-orthodox in thought. It was far less his intellectual, or even his moral, revulsion from Calvinism than his belief that new restraints were being forged for religious thought, that carried him into the Unitarian controversy." But though the author's sympathies are naturally and strongly with Channing's side of that great debate, it is evidence of our distance from the conflicts of that hour that he speaks with so full appreciation of the earnestness and seriousness of the "orthodox" reaction which drove Channing into the field of controversy in 1815. Controversy was, for Channing, always a painful experience. He had in his make-up none of the delight of battle. Mr. Chadwick well says of him:

"He was not, I think, a man of natural courage, but one of delicate and shrinking flesh and corresponding mind. His sermons and addresses abound in praises of moral courage, and he exemplified the trait he praised. But it was hard for him to do it. These praises were exhortations to himself to keep right on. They burned his ships; they cut off his retreat; they made any flinching on his part impossible. The things he said and did required *of him* a great deal of courage, however much or little they might have required of a quite different man."

What one misses, perhaps, in this sketch of Channing's theological development is due appreciation of the non-permanent and divisive effect of his extreme individualism, and of the degree in which conditions essentially local and provincial affected his religious thought. If the modern religious world has reached many of the conclusions at which Channing arrived, it has reached them not wholly by his road.

Channing's reformatory spirit, of which he gave such noble manifestation, sprang, as Mr. Chadwick shows, from his conviction of "the dignity of human nature." That conviction was to him so fundamental as to lead him to take, probably, the most positively sectarian position he ever assumed, when he held that in certain types of endeavor for the elevation of "the depressed classes" it would be a fettering compromise to be associated with those of other beliefs regarding this, to him, vital element of his creed. This conception of the dignity of human nature drove him into the anti-slavery conflict—a struggle, his part in which revealed his intense devotion to principles and his slight interest in individuals. His absence of all personal relation with Garrison, Mr. Chadwick points out as one of the curious manifestations of this trait of Channing's character. But his position towards the anti-slavery movement was, as Dr. Leonard Bacon of New Haven described a similar attitude, one of "betweenity." For slavery itself he had nothing but opposition; but his recollections of Newport and his acquaintance with the South had convinced him that not all slave-owners deserved denunciation for their connection with a system which, in itself, merited only condemnation. Nowhere more than in his opposition to slavery was his moral courage manifested; and nowhere did his principles cost him more hostility. From this same source of confidence in the dignity of human nature all of Channing's strong humanitarianism and reformatory interest sprang.

The description which the author gives of Channing's personal characteristics is admirably graphic, and sets the man as a sharply defined figure before the reader. One sees the constant care which his invalid health necessitated, the physical disability under which most of his labor was accomplished, and which limited his preaching to only occasional sermons during the latter part of his life. "It is hard to conceive that Channing was ever a good pastor, and he did not improve in proportion to his increasing engrossment in the large, social aspect of religion. 'I am strong,' he said, 'before the multitude, but weak before the individual.' He had no skill to meet his visitors halfway or to come down to the level of their interests."

Possessed of the respect and reverence of the community to a degree such as few men have enjoyed, his intimates were but a handful, though their attachment was lifelong. One of the closest of these few friends, Jonathan Phillips, remarked, with amusing moderation of judgment, regarding Channing, "I have known him long, I have studied his character, and I believe him capable of virtue." Certainly New England fear of exaggeration could not go further than this. Mr. Chadwick's characterization of Mr. Channing as a man deserves to be read as a whole. The conspicuous physical note he finds that of an "ill-constituted body":

"Intellectually, Channing has enjoyed the eminence which, like that of an isolated mountain, is relative to the low-lying plain. His measure was taken at a time when Boston was emerging from an intellectual mediocrity to which Fisher Ames bulked as another Burke or Cicero or Demosthenes, while denominational pride did much to aggravate the miscalculation and to pass it on. But, compared with the great intellects of the centuries, his intellectual ability makes as modest an appearance as his intellectual acquirements compared with those of the great scholars." . . .

"Channing's preëminence in his own generation, and his abiding claim upon our admiration and our reverence, are far less intellectual than moral and spiritual. It is, in fact, the moral temper of his mind, its openness to fresh conviction, that is its most impressive trait. The moral uses of the intellect were to him subjects of his constant interest. . . . He was a man of the beatitudes, so many of them found abundant illustration in the habits of his life. The blessing of the peacemakers was upon him; the blessing of the pure in heart. But his peculiar blessing was that of those who hunger and thirst after righteousness. If Channing did not do this, no man ever did. And, according to the promise, he was filled."

Viewed as a whole, Mr. Chadwick has given us a compact, graphic, and satisfactory portrait of a leader who has grown to be generally recognized, outside of the Unitarian fold where he has always been reverenced, as one of the most lofty and admirable personalities of the New England of the first half of the nineteenth century—an age that seems in many of its aspects so remote from the present time.

CLERKE'S ASTROPHYSICS.

Problems in Astrophysics. By Agnes M. Clerke. London: Adam & Charles Black; New York: Macmillan. 1903. 8vo, pp. 567. With 31 plates and 50 figures in the text.

The signal merits of this work will be recognized at once, nor will it cease in future to be esteemed as a breathing portraiture of youthful twentieth-century science in the department of the physiology of suns. It is a book needed by all persons who endeavor to keep up an all-round intelligence of the advances of human knowledge, and will soon be found lying well worn on the tables in all observatories. Executed with a laborious thoroughness that never tires, it is brought to the polish of a popular style—if anything, too much so. Yet it is not a book of popular science: it is a popular book on professional science—a thing seldomer to be found and quite otherwise enlightening. It is not with knowledge, organized or not, that the active thoughts of the man of science are busy; but on the contrary with all sorts of hypotheses, the most dubious things in the world. To be acquainted with science as it lives in his mind will not help one to build a flying machine, a yacht, or a wireless telegraph, but will educate one in the conduct of inquiry. It is this side of astrophysics which is presented in this volume, by an author who, if not a very eminent astronomer, has participated in the life of an observatory, and who mingles with the ablest astronomers of England and of the world, recognized by them as one of their guild. No little astronomy can be learned by merely looking through the admirable illustrations to the volume, which, now that observation is so largely conducted through the medium of the camera, are in many cases as near the real thing that the astronomer uses as single prints can be to multiplied negatives.

Having thus had the pleasure of recording

the principal merits of the book, we are in duty bound to acquaint our readers with such of its apparent shortcomings as will chiefly concern them if they read it. One of these, we feel quite sure, is an error of judgment in the matter of style. Tables and algebraical formulæ are avoided almost entirely. Now tables and formulæ may be dry and hard to comprehend, in the sense that the relations that they are fitted to express are so; but when it is precisely such relations that must form the substance of the discourse, and not for a paragraph only, but for five hundred closely printed octavo pages, by all odds the least fatiguing way of apprehending them is the way that exhibits visual analogues of them —as tables and formulæ do—and then points out in these icons the special features upon which attention must be directed, with a measure of emphasis proportionate to the effort required. Instead of endeavoring to do this, our author painfully searches out ornamental ways of stating abstract relations, with a view to literature. If she has occasion to mention that the parallax of Procyon, as determined with the Yale heliometer by the admirable skill of its manipulator, is 0″.325, she will say that "Dr. Elkin has measured for it a parallactic shift of 0″.325." The idea of a shift of any kind being measured for the little dog! If she wants to suggest that every star presumably turns on an axis, the word "rotation"—not, after all, quite rustic—will not be half elegant enough for her. She must say "it has a movement of gyration." So it is in countless cases. In short bits to be read one at a time, like those of Smyth's 'Celestial Cycle,' such rococo expressions will merely excite a smile; but when it comes to five hundred solid pages of detail to be read consecutively, they add to the labor of lading the mind with it all. For at each such novel expression the reader has to stop and consider what can be meant; and it is often a little enigma.

The only other fault of the book to which we shall advert is a mere matter of individual opinion, provided logic is a matter of individual opinion, as some hold that it is, and some even that it ought to be. We might give a graded series of examples of what we mean. We are told (p. 204) that "Canopus may be no further off, but cannot be nearer than a light-journey of 296 years." The foundation for this statement is that an attempt to determine its parallax gave zero as the result, with a probable error of 0″.011, which parallax, according to Euclidean geometry (whose applicability to such vast triangles is open to question), corresponds to a distance of 296 light-years. But what is meant by the "probable error" of a determination is that value of the error (or rather of such part of the error as the method of least squares can take account of) which is equally likely to be greater or less than the real value. Therefore the inference (so far as any is justified) is that were the same inquiry pushed indefinitely it would be just as likely to make Canopus more than 296 light-years from us as less. It may be added, however, that such result would in all probability not be many times less.

Again, we are told that, "upon Doppler's principle" (or words to that effect), a certain star must be approaching or receding from the sun. In a memoir intended exclusively for professional astronomers such an expression would be innocent enough, but in writing for a larger public one has to guard against too literal interpretations. Doppler's principle does not necessitate any such thing, but only that *if* the star were approaching or receding, then, so long as no unknown cause acted, the spectral lines would all be shifted toward the red or toward the blue, as they are observed to be. But it is to be remarked that there is some reason to suspect that unknown causes do occasionally interfere with the effect.

Having had our scold at Miss Clerke's style, it will be but fair to give our reader a bit or two of it. Very likely in such doses its flavor will please:

"Sun-spots are not simply rents in a shining veil, exposing an obscure substratum. They are not superheated regions, where the processes of condensation are suspended. The photosphere is screened, not perforated, by them. Moreover, the screening is by interposed vapors. Umbral absorption is mainly, if not altogether, of the gaseous kind. It is essentially linear and banded. No part of it can be safely attributed to the action of a foggy precipitate such as modifies elsewhere the 'surpassing glory' of the disk. They probably differ in this respect from 'pores' and 'veiled spots,' but specific inquiries on the point have yet to be made. There are strong indications that spot-spectra originate under conditions of increased pressure and diminished temperature. Still, the coolest umbræ must be hotter than the reversing layer, for otherwise the Fraunhofer lines would show bright against them, and, as we know, they cross them in dusky array. This circumstance is fundamental in solar thermal relations, yet has been generally overlooked" (p. 96).

"Total eclipses have ceased to be indispensable for the prosecution of chromospheric studies. Day by day the red rim of the sun, with the strange forms protruding from it, can be viewed spectroscopically; and day by day the same objects vestured in violet can be photographed under the broad shelter of the Fraunhofer K-line. Nevertheless, noontide darkness, when it comes, brings very appreciable help. Differences are noticeable between what can be seen in and out of eclipse. According to the late Professor Tacchini, the chromosphere always appears deeper under cover of the interposing moon, because it is surmounted by a pink-white margin, giving continuous light, and therefore spectroscopically invisible in daylight. Some prominences are probably of analogous composition. Only their skeleton forms come out in the crimson radiance of hydrogen; they are compacted and clothed with white materials, the shining of which is effaced by the glare of common day. . . . The objects called 'white prominences' belong indeed wholly to the pageantry of eclipses. First noticed by Tacchini at Caroline Island, May 6, 1883, they showed as lucid jets about a hundred thousand miles high, with a surface like granulated silver. Attempts made, after the return of daylight, to view them prismatically proved fruitless; they gave forth no hydrogen or helium rays. Again, at Granada, 29th August, 1886, a gigantic helical structure, described by Mr. Maunder as 'of the intensest silver whiteness,' towered three hundred thousand miles above the limb of the moon" (pp. 109, 110).

The continuous reader would have been spared a pause if the author had printed *hĕlical*, to show she simply meant eddying. She could not be expected to employ so vulgar a term as that. Another hitch in the reader's thoughts takes place when this structure is said to "tower three hundred thousand miles from the limb of the moon," though near a hundred million miles from the moon. The *limb* of the moon exists only in the vision of the spectator, and distances from it are properly measurable in degrees, minutes, and seconds, not in miles.

"An eclipse, visible in the Western States of North America, 29th July, 1878, disclosed a surprising spectacle. In lieu of the ordinary radiated corona there were seen 'bristles' of light at the sun's poles, enormous 'wings' at each side of the equator. Professor Langley observed the phenomenon from the summit of Pike's Peak in Colorado, at an elevation of 14,000 feet in a stainless sky. Thus favorably circumstanced, he was able to trace one wide beam to a distance of about five millions of miles from the sun, the other fully twice as far. The direction in which they lay proved, when carefully measured, to agree closely with that of the zodiacal light, and 'a faint central rib' emphasized the coincidence. . . . At the time of this eclipse the sun was in a state of exceptional tranquillity, and a search through the solar archives brought out the notable fact that a similar apparition had, eleven years previously—spots then too being nearly extinct—been described and depicted by Grosch of Santiago. . . . The concurrence of these phenomena with critical epochs in the sun's activity started the idea, due, in the first instance, to Mr. Ranyard, of varying coronal types. It was amply borne out by subsequent experience. From eclipse to eclipse, throughout the eleven-year cycle, the corona exhibits changes of form in marked conformity to spot-vicissitudes" (p. 127).

The Fundamental Problem in Monetary Science. By Correa Moylan Walsh. The Macmillan Co. 1903. Pp. 383.

What is the quality in good money that constitutes its goodness? Mr. Walsh assumes without proof that it is stability of value—that this is, at all events, the primary quality. The reason why stability of value is the prime constituent of goodness, he contends, is that money is used as a store of value for longer or shorter periods of time by lenders and hoarders. But value is of different kinds. What do we mean by that term when we say that money should be stable in value?

The author finds four varieties of value swimming *in gurgite vasto* on the sea of economics: (1) Use-value, or utility; (2) esteem-value, which he defines as "the affection or attachment we have for things—the energy with which we cling to what we possess, and the effort we are willing to put forth to acquire things"; (3) cost-value, or the effort or labor which things cost their producers; (4) exchange-value, or purchasing power. Use-value is generally ignored by economists as not appertaining to their investigations, since things may be useful but not exchangeable, or exchangeable but not useful. The author rejects it since, in the case of money, use-value is identical with exchange-value. Esteem-value cuts a large figure, and a rather confusing one, in Mr. Walsh's discussions. The best trained reader will be under the necessity of turning back frequently to the definition of this kind of value (quoted above) in order to make sure that he understands the author's meaning. On page 222 he defines it again as "exchange value in, or purchasing power over, labor alone, . . . forming the wages standard or, better, the earnings standard or the income standard." In another place (p. 295) he speaks of "the true conception of esteem-value, out of several conceptions not yet

clarified." Cost-value of money means the cost of extracting from the earth and reducing the material of which it is composed. The old maxim that value is measured by cost of production has been much shaken of late. Even its advocates admit that it is only approximately true. "Value in exchange" is the only sense in which economic science here concerns itself with value. This is purchasing power—but the purchasing of what? Some say commodities, others say labor, still others say commodities and labor. Mr. Walsh gives good reasons (p. 322) for rejecting labor from this category altogether, thus making the value of money mean its command over the tangible things which are bought and sold in the world's markets.

Now the question which the author puts is this: "What kind of value is it that money measures and stores and should possess in a stable manner?" If it is exchange-value, the answer is that there is no such thing on this mundane sphere—that stability of value is impossible in any substance which is now, or ever has been, or ever can be, since value is a relation between variable things. What are we to understand by the word "should" in this query? It implies that if the thing which men are now using as money is not stable in value through the ages, it is not good money or not good enough. If so, it is open to any complainant to show us a better, and it is not necessary for this purpose to write a book of 400 pages to prove that all previous writers, except a few rather obscure ones, have tripped and stumbled in their use of the word value, giving it now the meaning of exchange-value, now that of esteem-value, and again that of cost-value, and passing from one to the other without seeming to be aware of the differences, and thus reaching conclusions which are non-sequiturs. Mr. Walsh finds this proneness to slipshod reasoning among French, German, Austrian, Italian, and Spanish, as well as English and American writers. He quotes from, or cites with chapter and verse, more than 300 writers, ranging from Harvey, the author of 'Coin's Financial School,' and R. G. Horr of the 'Great Debate,' to Adam Smith, Ricardo, and J. S. Mill. His acquaintance with the authors whom he quotes is not superficial, and his citations are not unfair, or not consciously so. Yet we think that he has introduced more confusion into the subject of debate than he has cleared up.

It is not true that stability of value is the quality in good money that constitutes its goodness. This is not the primary quality. Acceptableness is that quality. Whether money is stable, or divisible, or portable, or yellow, or white, or copper-colored, it must first of all be something that "passes" without dispute or delay. This facility of passing may be due to a variety of attributes, of which stability of value (in a greater or less degree) may be one, but it must have been the outcome of experimentation, of the unconscious kind, long continued and forming a custom eventually embedded in law. Aristotle, in his account of the origin of money, does not mention stability of value as one of its attributes, but only those qualities which fit it for a common medium of exchange, namely, ease of carriage, utility for other purposes than money, and the capability of receiving and retaining a stamp for identification. He says that the barter of one commodity for another preceded the use of money, and that the inconvenience of barter led to the choice of something possessing the three qualities named. He mentions iron and silver as examples. The use of money as a store of value by hoarders would naturally follow, provided the material of which it was composed would not readily decay or deteriorate. Its use as a standard of deferred payments would naturally follow, unless something more satisfactory to both borrower and lender could be agreed upon. But it is unlikely that either of these uses would antedate its use as a common medium of exchange.

If acceptableness, or the quality of passing, is the *sine qua non* and bottom fact of good money, the author's query should be stated thus: The common medium of exchange (*e. g.*, gold), being what it is, how should time-contracts be drawn to the best advantage of the parties? Or, if society has interests superior to, and different from, those of borrowers and lenders, or either of them, how should time-contracts be drawn to conserve its interests? We find no help between the covers of Mr. Walsh's treatise toward an answer to this concrete question. He makes frequent reference to the tabular standard of value (of Lowe, Scrope, and others), but nowhere advocates its adoption as a practical measure. Nor does he advocate any change except a change in the mental attitude of economists toward the definition of value. What that change should be he does not indicate, but merely that they should feel the need of a change. They should have a "conviction of sin."

In the last chapter but one a decided tendency is manifested to espouse the side of the debtor as against the creditor, and a lesser tendency to favor the employee as against the employer, without, however, any suggestion of means to do so in either case. But, after exhibiting this bias, the author proceeds (p. 362) to lay down the sound proposition that—

> "Money has not, properly speaking, any function of distributing wealth to the different classes of society. . . . Money is not properly an agent for the execution of anybody's theory as to what ought to be the proper distribution of the benefits of improvements [in production] between the several classes of society."

The question how time-contracts may be drawn so as to subserve the greatest good of the greatest number is an open one, to which we hope that Mr. Walsh may at some future time direct his dialectical powers and his learning, both of which call for our admiration even where we do not accept his judgments.

Dramatic Criticism. By A. B. Walkley. E. P. Dutton & Co. 1903.

There is an old story of a sturdy English farmer who was asked by his landlord host, at a rent dinner, whether he liked the claret, to which he had been devoting himself most assiduously. "It is good drinking," he replied, "but somehow you don't seem to get much 'forrader.'" In a slightly altered form this remark might be applied to Mr. A. B. Walkley's little book, which is composed of three lectures delivered at the Royal Institution in London last February. They are very good reading, but leave the matter of which they treat pretty nearly where it was before. Perhaps they are most interesting as a demonstration of Mr. Walkley's wide acquaintance with theatrical and other literature and his ready command of apt quotation and illustration. He makes, indeed, a considerable display of erudition, filling his pages with plentiful and apposite excerpts from authors of various times and nationalities, from Aristotle to M. Filon. Thus he furnishes an excellent epitome, so far as it goes, of the opinions of successive ages on the value and functions of criticism, the structure and aim of drama, and other kindred topics.

But, after all, he does not succeed in throwing any new light upon the points which he discusses or in giving to the art of criticism a clearer definition, more precise laws, or a more assured position than it already possessed. The utility, the scope, and the limitations of criticism are tolerably well understood nowadays by all who are capable of employing or enjoying it. What he has to say about the composite character and moderate critical faculty of the average audience, or of the public in general, is approximately true—although his estimate of the popular intelligence may seem rather low to persons of longer theatrical experience than himself—but it certainly is not new. Nor is it necessary at this late day to explain that different critics, of equal capacity, are likely to regard the same thing from opposite points of view. The variety in the personal equation, of course, is infinite, and is never more strikingly manifest than in the consideration of questions of taste rather than of fact. But—and Mr. Walkley does not insist sufficiently upon this point—wherever there is a fixed standard of merit by which a work of art can be judged, or, in other words, in cases where the verdict is dependent upon knowledge and experience rather than upon sentiment or opinion, there is not likely to be any radical disagreement between properly equipped critics.

It is a pity, perhaps, that Mr. Walkley, instead of taking so much trouble to explain points which are not in dispute, did not pay more attention to the swarm of pseudo-critics who have brought upon the craft the contempt of which he complains, by assuming an office for which they are utterly unfitted. It is, unfortunately, notorious that a large proportion of what is commonly called dramatic criticism on both sides of the Atlantic is as contemptible in quality as only too often it is disgraceful in motive. But this foolish or venal stuff cannot be defended, and need not be explained. As for the varieties of genuine criticism, dogmatic, impressionistic, etc., any attempt to discriminate between their respective excellences is necessarily futile. Each is sure of its admirers if it be good of its kind. Mr. Walkley himself, for instance, who uses more methods than one very skilfully, will almost always give pleasure to his readers, even if they do not agree with him.

Obermann. By Étienne Pivert de Sénancour. With biographical and critical introduction by Arthur Edward Waite. Brentano's. 1903.

"J'ai avoué que, n'étant pas un érudit,

j'avais, en effet, le malheur d'aimer mieux les choses que les mots," says the melancholy dreamer whose meditations Mr. Waite has undertaken to render into English. Nevertheless, the style of De Sénancour, for all its dilution, offers in general such precision as might be expected in a writer who, in spite of himself, inherits the classical traditions of the eighteenth century; it were to be wished that something of the same spirit had animated his present translator. For Mr. Waite, singularly enough, succeeds in conveying the more remote and abstract views of his original, while again and again falling into the most unaccountable mistakes in translating simple everyday words or expressions.

The first hundred pages show a sufficient crop, with allowance for variants in the original text. 'Le *couchant vaporeux*, mais sans nuages": "The summit softened, but not clouded" (p. 11). Obermann remarks sarcastically that some people imagine themselves on a country ramble "lorsqu'ils marchent en ligne dans une *allée sablée*"; why should any one take this to refer to a "dusty lane" (p. 15)? Of the social ostentation which he detests, yet finds everywhere, the morose wanderer says: "Mais de gros villages, mais des maisons de pierre, mais de la *recherche*," etc.; the translator gives the last word as "quest" (p. 18). "L'air était calme, on n'apercevait *aucune voile* sur le lac" furnishes the unexpected statement that "no veil of mist was visible" (p. 20). When the mountain clouds "*brunissent* les sombres sapins," Obermann notes a specific effect in color, missed in the offered equivalent of "glooming" (p. 30). "Le Jorat, qui n'est qu'une butte auprès des Alpes" undergoes an unwarrantable transformation into "only a slope near the Alps" (p. 30)—an assertion not to be hazarded in the Canton de Vaud. An invitation to share quarters in a *campagne (maison fort jolie)* is tortured into an offer "to take up my residence on his property" (p. 32). Dislike of hugger-mugger, slovenly ways, leads Obermann to speak with some disdain of the cheap Stoic "qui se fait la barbe" before a cracked mirror, while the children's clouts are hanging "contre le tuyau du poêle." One can understand that an Englishman of to-day should confound "shaving" and "beard-trimming" as the result of an expression which Sainte-Beuve, sixty years ago, noted as a solecism in his study of Töpffer; but what, save an external resemblance in spelling, could suggest to any one the use of a "frying-pan handle" as a clothes-peg (p. 68)? If the errant philosopher in search of shelter declares "*J'enfonçai* la porte antique," he certainly did not "secure" it (p. 80). In matters of detail, this translation calls for sharp revision.

An introduction of some eighty pages gives Mr. Waite free room for expatiating on his own interest in mystic and theosophic speculation, the subject with which his voluminous contributions to occultism have long connected his name. As the result of independent investigation, his conclusion substantially agrees with that of M. Jules Levallois, who, in a monograph published in 1897, professed to have discovered in the work of De Sénancour much deeper characters of mystical tendency than any of the latter's earlier critics might have been willing to admit. Mr. Waite enlarges on the theme, and traces what appear to him a number of significant analogies between De Sénancour and the strange personality of the Marquis de Saint-Martin, the "Philosophe Inconnu" of the eighteenth century; for this purpose, frequent references are made to the scarce 'Libres Méditations,' which, under this illumination, may be made to appear as the natural, though incomplete, outgrowth of the most wayward reveries of 'Obermann.' "What we find is the sorrow, the aloofness, the loneliness of the mystics, but none of their unction. In his forty-eighth letter Obermann approaches them more intimately, for he comes very near to the confession of universal sacramentalism, within even the pronaos, and we see that he is also in search of the Lost Word" (Introduction, p. 59). One can but contrast so far-reaching a statement as this with the judicious reserve of Sainte-Beuve, who pointed out that De Sénancour had ultimately risen "à une sorte de théosophie morale, toute purgée de cette âcreté chagrine qu'il avait sucée avec son siècle contre le christianisme, et toute pleine, au contraire, de confiance, de prière et de douce conciliation."

The translator's eagerness for more or less veiled indications of sympathy with his own views reminds us of Coleridge's remarks on Sir Thomas Browne, who seemed to have detected "quincunxes in heaven above, quincunxes in earth below, quincunxes in the mind of man, quincunxes in tones, in roots of trees, in leaves, in everything." Insistence on the mystical as the vital attribute in De Sénancour's writings—as the one fact that justifies a complete version of 'Obermann' all but a century after its original appearance—involves the arbitrary displacement of the real centre of interest in the work of one whose intellectual filiations were both so multiple and so elusive that ample treatment of the influences which he either underwent or exercised would cover the literary history of nearly three generations.

The Life of Joseph Parker, Pastor of City Temple, London. By William Adamson, DD. With portraits and illustrations. Fleming H. Revell Co.

There is nothing in the appearance of this book to commend it, and there is something slovenly in its inward fashion. No pains have been taken to conform the preface, which expresses a desire for Dr. Parker's recovery and renewed activity, with the closing chapter, which contains an account of his last sickness and his death. The preface is dated September, 1902; he died November 28. The book, then, is not one of those written in hot haste to economize the funeral baked-meats for a feast so prompt that they will not get cold and tasteless. It was evidently intended to be written in the lifetime of the subject, and to minister to his pleasure with the warmth of its appreciation. It is probably less critical than it would have been if it had been written after Dr. Parker's death, much less so than if it had been a few years delayed. But clearly he was one of the great popular preachers of his time; much more a lighter Spurgeon or Beecher than a coarser Phillips Brooks, in lack of delicacy sometimes approximating Talmage, to whose level of character fortunately he did not tend. Called "the English Beecher," he was that even less aptly than Cooper was "the American Scott." Certainly there is nothing quoted by Dr. Adamson that so much as suggests the poetic quality of Beecher's mind or his inexhaustible humor. The most resembling feature—witness the portraits on pages 110, 192—is the full, loose upper lip, indexical of eloquence.

In his theology Dr. Parker was much more orthodox than Beecher, though hardly more sectarian. Born April 9, 1830, his father was a stonemason, a stern Calvinist, who broke with his Independent minister as a New Light, and joined the Wesleyan Methodists, a paradoxical proceeding. But at twenty-two the son found his way back into the Independent fold, and soon into a colleagueship in London with Dr. John Campbell, an "Auld Licht" of the severest type and the strong tower of the Congregational Union. Campbell's fervor heightened that which was natural to young Parker, revealed, as was his rhetorical exuberance, in his early choice of texts, one of them, "If I whet my glittering sword and mine hand take hold on judgment, I will render vengeance to mine enemies, and reward them that hate me." He soon went to Banbury; then to Manchester, where he was when our civil war came to an end. There could not be a better token of his characteristic manner than his remark on a collection for the freedmen, taken the Sunday before: "This city is designated Cottonopolis. There are manufacturers and merchants in it who have made their pile through the blood and marrow of these now liberated slaves, and yet it is with sorrow and pain that I cannot describe, that I am compelled to announce that the collection made here last Sunday was a disgrace to civilization."

He went up to London in 1869, first to the Poultry Chapel and soon to City Temple, by which he is named and known very much as Beecher is by Plymouth Church. There was much talk of him as Beecher's successor, but we are assured that no invitation was extended, though he came to this country, preached for Beecher's people, and pronounced a eulogy on him, the conclusion of which for depth of bathos could hardly be outdone. The higher criticism found in him an antagonist who did not mince his words, and perhaps he better understood the fundamental bearing of that criticism than those do who are working out its problems. A satire upon Huxley and Tyndall is quoted as a brilliant performance. If it was so, the quotations are unfortunate. But there is abundant evidence of the man's energy, vitality, sincerity, and warm humanity, and his qualities were such as to create and to deserve the popular success which he enjoyed.

De Necessariis Observantiis Scaccarii Dialogus. Commonly called Dialogues de Scaccario. By Richard, Son of Nigel, Treasurer of England and Bishop of London. Edited by Arthur Hughes, C. G. Crump and C. Johnson. Oxford: Clarendon Press; New York: H. Frowde. 1902.

From time to time there issues from one

or the other of the English university presses a piece of editorial work so adequate and so definitive as to challenge the preëminence of German scholarship in economic writing. Thus, the lamented Miss Lamond's 'Walter of Henley,' and even more her 'Common Weal of England'; Mr. Cannan's 'Lectures of Adam Smith,' and our own Professor Hull's edition of Sir William Petty, indicate the highwater mark of scientific method combined with painstaking fidelity in the preparation of economic texts.

The volume before us takes rank easily in this splendid group. The editors, with a reserve that is almost depreciation, state that their chief object has been to secure an improved text, and to collect together the many stray references to the book and reduce them to the form of a commentary, adding such results of their own researches as have seemed to them to escape the notice of others. "No claim for originality," the preface states, "is made by any of the editors for any part of their work; but every effort has been made to trace suggestions to their original authors." Few economic students will acquiesce in this excessively modest estimate. It has long been recognized that the text of the treatise which Thomas Madox first printed in 1711 as an appendix to his 'History of the Exchequer,' and which Bishop Stubbs made more generally accessible in 1870 in the 'Select Charters,' is in important places corrupt and unreliable. The critical construction of a better text by fresh collation with primary manuscripts would in itself have been a service to students of English constitutional and economic history. When such a text is issued with a full but unobtrusive editorial apparatus of text variants, historical introduction, and critical annotations, the service becomes a boon.

The text of the present edition has been constructed from three sources, viz., the two Exchequer MSS., known as the Red Book (R) and the Black Book (N), and the Cotton MS. (C). In doubtful readings, the evidence of N and R combined have been considered as slightly superior to that of C alone. In the absence of agreement between N and R, the text has followed C, while the agreement of C with either N or R has been regarded as conclusive.

The editors have adopted as the proper title of the treatise the phrase which the author himself employs in referring to its contents—"de necessariis observantiis scaccarii." The accepted title "dialogus de scaccario" is explained as probably due to a misunderstanding of the titlepage prefixed by Madox to his edition. In connection with the question of authorship, an interesting suggestion is made that the association of the treatise with Gervase of Tilbury, which prevailed for many years before Madox, arose from a confusion of the work called 'Tricolumnis,' which the author of the 'Dialogus' speaks of as his own, with the 'Historia Tripartita' of Gervase of Tilbury. Madox's identification of the real author of the treatise with Richard, Bishop of London, is abundantly confirmed by the researches of the present editors.

The Arts in Early England. By G. Baldwin Brown, M.A., Watson Gordon Professor of Fine Art in the University of Edinburgh. Vol. I.: The Life of Saxon England in its relation to the Arts. Pp. xiv., 388. Vol. II.: Ecclesiastical Architecture in England from the Conversion of the Saxons to the Norman Conquest. Pp. xviii., 350. Maps, plans, and illustrations. London: John Murray; New York: E. P. Dutton & Co. 1903.

We have here a vivid picture of the England of Saxon days, with its life and art. The first volume lays a groundwork for the study of the artistic remains of the period, by examination of the relation of town to country a thousand years ago, and by an inquiry into the coming of Christianity into England and its influence on the life of the people as expressed in churches and monasteries. Although in no sense a history of Saxon England, the volume reconstructs from the scanty remains of the time a scene that is as convincing as it is interesting. The second volume deals exclusively with ecclesiastical architecture in England from the conversion of the Saxons to the Norman Conquest, and forms a treatise altogether more complete than anything that has appeared on that subject.

Since any satisfactory chronological classification of these buildings appears at present quite out of the question, Professor Brown treats his examples from the point of view of the types they offer, and thus we have in turn the nave and its proportions, openings, balusters, caps, the treatment of western ends with towers, etc., etc. In this way a vast amount of material is passed under review, and scarcely any considerable Saxon fragment escapes notice. The great number and wide distribution of churches that exhibit remains of Saxon building must be a source of surprise to many. On a map prepared to show such churches and included in the book we count almost 200 in England alone. No intimation is given in the work of other volumes yet to come, but it would seem safe to assume that, with so broad a foundation as that laid by the first volume, and with so worthy a treatment of Saxon architecture as that given in the second, there should be, to justify the work's title, at least a third dealing with the smaller objects on which the Saxon craftsman exercised his skill and taste—objects such as weapons, brooches with engraved enrichments, ornamented combs, cups of cunningly wrought glass, and a store of miscellaneous things found in graves and treasured in museums.

The illustrations, done in pen and ink, seem a bit crude as such things go nowadays, but the plans drawn to a uniform scale are excellent. The author's style is lucid and animated. Some of his descriptions, as the picture of mediæval England, in the introduction are altogether masterly.

The Quaker: a Study in Costume
King Charles I. of England wore Quaker costume when posing for the well-known portrait by Vandyke. The beautiful Miss Fitzgerald, lady-in-waiting to Queen Caroline, also wore garments of Quaker cut. In both cases the Quaker element entered after the event, i.e., styles once worldly became Quaker by adoption.
The origins and transmutations of Quaker costume are entertainingly explained and freely pictured in this beautiful volume by Amelia M. Gummere. 8vo, half ooze-sheep, 240 pages, 75 illustrations, $3.00.

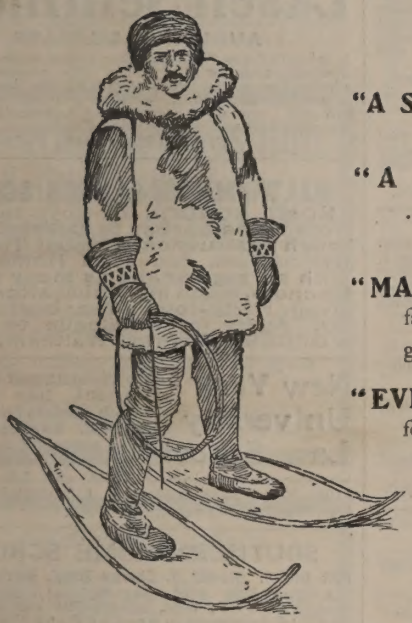
MR. JACK LONDON'S NEW NOVEL

The Call of the Wild



"The whole story is vital with interest."
—NEW YORK HERALD.

"A STORY THAT GRIPS the reader deeply. It is art, it is literature."
—MAIL AND EXPRESS, New York.

"A PICTURE that in its wonderful imaginative quality stands quite alone . . . altogether a most exceptional book."
—COMMERCIAL ADVERTISER, New York.

"MARVELLOUSLY INTERESTING. . . . It is written in masterly fashion. There are whole pages that thrill like poetry, whole passages that glow with splendid truth." —THE LOUISVILLE TIMES.

"EVEN THE MOST LISTLESS READER will be stirred by the virile force of the story, the strong sweeping strokes with which the pictures of the northern wilds and the life therein are painted by the narrator. . . . More than that, it is one of the very best stories of the year, and one that will not be forgotten."
—THE PLAIN DEALER, Cleveland.

"A BIG STORY IN SOBER ENGLISH and with thorough art in the construction . . . a wonderfully perfect bit of work . . . a book that will be heard of. The dog adventures are as exciting as any man's exploits could be, and Mr. London's workmanship is wholly satisfying." —THE NEW YORK SUN.

"THE STORY IS ONE THAT WILL STIR THE BLOOD of every lover of a life in its closest relation to nature. Whoever loves the open or adventure for its own sake will find 'The Call of the Wild' a most fascinating book."
—THE BROOKLYN EAGLE.

"IN THE FIRST PARAGRAPHS OF THIS SUPERB STORY the reader's interest is irresistibly aroused and attention is held enchained to the end . . . here is excitement to stir the blood, here is picturesque color to transport the reader to primitive scenes . . . and here is excellence of literary workmanship deserving of unreserved praise." —THE PRESS, Philadelphia.

"IT IS A TRIUMPH . . . THE STORY IS THE THING AND IT IS A FINE ONE."—THE EVENING SUN, New York.

LONGMANS, GREEN, & CO.'S NEW BOOKS

American Citizen Series.—(New Volume)

Actual Government

As Applied Under American Conditions

By ALBERT BUSHNELL HART, LL.D.,

Professor of History in Harvard University.

Crown 8vo, Pages xliv-600. With Maps, Diagrams, and Illustrations. $2.00. (*Next Week.*)

CONTENTS: Part I. Fundamental Ideals—II. Will of the People—III. State Governments in action—IV. Local Governments in Action—V. National Government in Action—VI. Territorial Functions—VII. Financial Functions—VIII. External Relations—IX. Commercial Functions—X. General Welfare—Index.

The reason for this volume is the conviction that there is room for a text-book which shall emphasize five points of view with respect to American Government.

First of all, the governmental system is treated as a whole, state and local governments being considered as integral parts of one American Government.

The second necessity is to study the actual workings of government. The text of constitutions and of statutes is only the enveloping husk; the real kernel is that personal interest and personal action which vitalizes government.

In the third place, the book discusses not only the machinery of government, but the operations; the functions of government are more important than the details of governmental organizations.

Fourth, the historical is not separated from the descriptive. Finally, there is at the service of the student a large body of cogent material, both essential sources and carefully wrought secondary books. It has been thought a proper part of this work to prefix a bibliography on the subject, as well as to insert classified references at the heads of the chapters.

An Introductory Study of Ethics

By WARNER FITE, Ph.D.,

Instructor in Experimental Psychology in the University of Chicago.

Crown 8vo, pp. xii–383. $1.60.

CONTENTS: Introduction: I. The Scope and Method of Ethics—II. The Ethical Problem.—PART I. *Hedonism:* III. Empirical Hedonism. The Ethics of Happiness—IV. Scientific Hedonism: The Ethics of Self-Preservation—V. Hedonistic Social Theory—VI. Hedonism as a System of Philosophy—VII. Hedonism and Common Sense—VIII. Hedonistic Social Theory and Common Sense.—PART II *Idealism:* IX. Intuitionism: The Ethics of Conscience—X. Rationalism: The Ethics of Principle—XI. Self-Realisation: The Ethics of Purpose—XII. Idealistic Social Theory—XIII. Idealism as a System of Philosophy—XIV. Idealism and Common Sense—XV. Idealistic Social Theory and Common Sense.—PART III. *Hedonism and Idealism: The Moral Situation:* XVI. The Situation from a Metaphysical Standpoint—XVII. The Situation from an Evolutionary Standpoint—XVIII. The Practical Moral Attitude—XIX. Concrete Illustration of the Moral Attitude—INDEX.

This book is intended both for the college student and the general reader. Its general aim is to present a comprehensive and coherent view of the moral nation. To this end it undertakes (1) to define the moral problem as presented in our modern life; (2) to state and criticise the leading types of ethical theory; and (3) to propose a method for estimating the worth of theories and for dealing with the practical problem. Among these objects the burden of emphasis is laid upon the first two, the writer's purpose being to offer a positive and tangible basis for ethical thinking without abridging the independence of thought of student and reader.

The Nation.

NEW YORK, THURSDAY, AUGUST 6, 1903.

The Week.

The new cable from Manila began its service by bringing an appeal for help for the Filipinos penned by Governor Taft, and seems destined to be the means of transmitting many a similar entreaty. On Thursday the newly organized Filipino Chamber of Commerce employed it to address Secretary Root, and "pray as salvation for critical condition of country that tariff upon our products be abolished." The stone for bread which Secretary Root is forced to give them because of the indifference of a Republican Congress, is an empty compliment. "We look," he cabled, "for the most beneficent results from the intelligent treatment of questions affecting the prosperity of the archipelago" by this new Chamber. Doubtless Señor Reyes and his associates will reply: "But that is exactly what we have looked to Congress for in vain." By the side of their freshly urgent appeal, the stereotyped bulletin about Philippine customs receipts showing a gain of $30,000 in the first four months of 1903 as compared with the same months of 1902, seems absurd. The truth is that, despite the three millions wrung from a reluctant Congress, the condition of the islands is still very far from satisfactory.

The renewed calling for free trade by the inconsiderate Filipinos is only one of the trials of the Republican "stand-patters." The Cuban reciprocity treaty is looming. It was especially to approve of it that the President determined to call an extra session of Congress. Eminent "stand-patters" had assured him at the time that a slight letting down of the tariff bars for the Cubans would not be inconsistent with the sacred doctrines of "stand-pattism." But trouble is now brewing. Protectionists on the watch-tower are saying that there is danger in any lowering of the tariff whatever, whether for Cubans or anybody else, and whether we promised it or not. They detect in the innocent-looking Cuban treaty that awful thing, the entering wedge, as well as the first step that costs and the camel's head inside the tent. Dropping figures of speech and coming down to hard legal claims, the contention is made that the Dingley tariff was of the nature of a contract between the Government and the parties benefited, and that the latter have in consequence a vested right with which no treaty and no international policy must be allowed to interfere. But this, gasps the pained *Tribune*, is to assert in the name of protection the worst that its enemies ever charged. Possibly, however, the said enemies have all along had a more correct idea of the unflinching greed of the protective system than its amiable and somewhat gullible defenders in the press.

"Prince of Grafters" is now the title bestowed upon August W. Machen, the former General Superintendent of Free Postal Delivery, who was again indicted in Washington on Friday. We must confess that he seems to have earned it, and to be of such abilities as would have made him a Parks among labor leaders or a "Napoleon of finance"—a certain kind of finance—in Wall Street. To him every letter-box that was painted brought a tribute; while every mail-bag, leather case, or satchel seems to have added to the contents of his purse. Sixty cents on every case is certainly a handsome royalty for this distinguished son of Ohio. We have heard much of that State's influence in Washington under the Presidency of the latest of its sons to enter the White House, but for the news of an Ohio "gang" we were not prepared. This combination had, it appears, a regular headquarters at the insurance office of one W. C. Long, for some time suspected and now also indicted. Machen, Hedges, Rand, Gartree, and others met there, doubtless merely to discuss the welfare of the nation and of its most favored State. As for Mr. Rand, that great confidential clerk in whom Mr. Payne has such tender confidence, he is, we regret to learn, absent without leave. The relentless Mr. Bristow on Friday bagged a mayor in his list of ten freshly indicted persons, and it is understood that there are still more to come. Mr. Payne, who has now returned, has nothing to say. Is it possible that there is no more "hot air" in Washington?

A correspondent writes to ask if there is no law in the country to prevent a cotton speculator from so cornering the market and putting up the price that the mills have to close down. We know of none, except economic law. The closing of the cotton mills in New England and elsewhere is, in fact, one way in which that economic law enforces itself. When the price of cotton is made so artificially high that the mills refuse to buy, the financial burdens of those who are "carrying" the corner are by so much increased, and their prospective profits diminished. The immediate losses are made those of speculators, not of manufacturers. Moreover, the shutting down of the mills now is the best guarantee that no serious effort will be made to corner the new crop. That will soon be coming along to relieve the situation. Incidental hardship there has undoubtedly been, with a fearful demoralization of the cotton market. We believe, however, that the proper remedies are being applied. Cotton is bought, after all, only to sell to the mills; and if the mills won't buy at a certain figure, the price is bound to come down.

Senator Platt agrees with Senator Gorman that it would be shocking to introduce the negro question into politics. The matter is too grave, too painful, too heart-rending for politicians to think of touching it. Politics being, in the Platt-Gorman definition, simply a scheme for dividing the offices, it is obvious that the intrusion of any such question as equal enforcement of the law or the vindication of elementary human rights, must seem to them a wild absurdity. Why disturb them in their statesmanlike broodings over the question who shall have this collectorship or who be put into that post-office? What has gross injustice to millions of American citizens to do with real politics? We observe, however, that one Senator is foolishly concerning himself with that negro problem from which the noble Gorman and the lofty-minded Platt turn away in such disgust. Mr. Hoar of Massachusetts has been addressing the summer students at Worcester, and strangely defending the doctrine that the laws of the country should be enforced among white and black alike. In this connection, he took occasion to refer to the decision of a Massachusetts man now sitting in the Supreme Court of the United States—Mr. Justice Holmes—and to say of his refusal to hear the prayer of the illegally disfranchised negroes of Alabama, that it was "a judgment more far-reaching and terrible" than the famous dictum of Taney in the Dred Scott decision.

If the Chicago *Tribune* is correctly informed, ten negroes have been legally executed in the State of Alabama since January 1, all for murder or robbery. During this period there has been only one lynching, which is certainly a remarkable and most encouraging showing, and one that should make the Governors of Indiana and Illinois extremely envious. We do not include Delaware, for, as the Rev. Dr. Babbitt pointed out in a letter to the New York *Tribune* on Sunday, its officials seem to be dead to all shame, if not actually in the position of consenting to and approving the Wilmington horror by their failure to seek out any of the lawbreakers. There are further signs in the South of a reaction against lynching. Sheriff Summers of Iredell has saved a negro accused of assaulting a white woman by taking him

to the jail at Charlotte, N. C., and keeping off the would-be lynchers at the point of his pistol. His name deserves to be written on the new roll of honor alongside that of Sheriff Whitlock of Danville, Ill., and of the Texas sheriff who outrode a mob of his neighbors and safely jailed his charge. The reason for the praiseworthy decrease in lynchings in Alabama is plain. Criminals in cases of violence are being promptly arrested, tried, and punished.

It is generally admitted that Judge Lochren's decision of Saturday at St. Paul, finding for the Northern Securities in the suit of the State of Minnesota, cannot directly affect either of the two main suits still pending. These are the Attorney-General's suit to dissolve the company under the Sherman act, and the suit of the State of Washington to restrain the company from doing within that State, under a New Jersey charter, acts prohibited by the Washington statute law. Both of those cases are now on the calendar of the United States Supreme Court. The gist of Judge Lochren's reasoning, as a result of which he reaches opinions contrary to those of the Circuit Court at St. Louis in April, may be learned from the following excerpts from his opinion:

"The Northern Securities Company is merely an investor in and owner of a majority of the stock of each of these two railroad companies. It has done no act and made no contract in restraint of trade or commerce. . . .

"I am compelled to reject the doctrine that any person can be held to have committed, or to be purposing and about to commit, a highly penal offence, merely because it can be shown that his pecuniary interests will be advanced thereby, and that he has the power, either directly by himself, or indirectly through persuasion or coercion of his agents, to compass the commission of the offence."

How broadly this conclusion of Judge Lochren opposes that of the Circuit Court, may be seen by the following paragraph from Judge Thayer's opinion on that occasion:

"The [Northern Securities] scheme . . . destroyed every motive for competition between two roads engaged in interstate traffic which were natural competitors for business, by pooling the earnings of the two roads for the common benefit of the stockholders of both companies; and, according to the familiar rule that every one is presumed to intend what is the necessary consequence of his own acts, when done wilfully and deliberately, we must conclude that those who conceived and executed the plan aforesaid intended, among other things, to accomplish those objects."

We shall not at present comment on this rather curious divergence of judicial reasoning further than to recall a paragraph from another decision under the Sherman act, rendered in 1897 by the Supreme Court itself. The Trans-Missouri Freight Association, formed for the purpose of "establishing and maintaining reasonable rates, etc.," was adjudged an illegal combination. The Association pleaded lack of proved violation of the Sherman act, or of proved intent to violate it. The court rejoined:

"The suit of the Government can be maintained without proof of the allegation that the agreement was entered into for the purpose of restraining trade and commerce, or for maintaining rates above what was reasonable. The necessary effect of the agreement is to restrain trade or commerce, no matter what the intent was on the part of those who signed it."

Populism must be at its last gasp or it would find more grandiloquent, more finely Bryanesque words to celebrate the union of its two factions. To be sure, the United People's Party, in conference at Denver, reaffirms its allegiance to that "immortal document," the Omaha platform, but its present resolutions lack rhetorical fervor. Time was when silver was never mentioned without a trope; now it slips modestly into the clause demanding "a money, whether stamped on gold, silver, or paper." Evidently these are regarded as equally valuable materials for monetary purposes; but since the world thinks otherwise, we predict that the Populists will gradually transfer their veneration to the most come-at-able of the three—namely, paper. The only thing that can prevent this painless lapse from silverism into the old greenback heresy is the carrying into effect of another demand made in the Denver resolutions, namely, for "a system for the transmission of intelligence." That system, the Populists think, should be owned and operated at cost by the Government; but other agencies will meanwhile have to devote themselves to what is certainly the pressing need of most members of the People's Party.

Mayor Johnson of Cleveland is meeting with unexpected opposition to his plan for a municipal electric lighting plant. He has been preparing, of course, to answer the usual arguments against a public enterprise of this character, but now the preliminary question is raised whether the city can at this time afford the luxury of the lighting plant, even if it is admitted to be something wholly desirable. The city's credit, it is being pointed out, is already strained to provide for improvements which are not in the least experimental in their nature. The sewer system, for instance, is incomplete. The water system badly needs the extension of a tunnel to an outer crib, so that all parts of the city may have pure water, and also so that the city may not be dependent upon a single source of supply subject to a breakdown at any minute. These, it will be noticed, are municipal enterprises already entered upon, and it is a fair argument that provision for their completion should have the first call on the public purse.

Sir Wilfrid Laurier's plea for Canadian independence, in Ottawa on Thursday night, was dictated by political necessity. The transcontinental extension of the Grand Trunk, which he was advocating, is a contentious matter. In fact, the Minister of Railways, Mr. Blair, resigned because he disapproved of the Government's support of so costly a scheme. Very likely, then, Sir Wilfrid felt that it would stiffen up timid supporters of the plan to be told that the new line would make the railways of the United States less indispensable to Canada. Thus he sets transportation facilities against the alluring proffer of high protective duties made by the Opposition. But, political considerations aside, Sir Wilfrid expresses a real and growing sentiment. Canada has come to full national consciousness, and desires to be independent commercially and politically. Legislative bounties and the clamor for prohibitive duties are merely perversions of that feeling, with which whoever deals with Canada—whether Mr. Roosevelt or Mr. Chamberlain—must reckon seriously. It would be unfortunate for both Canada and ourselves if this new nationalism should lead to tariff retaliation on their side. The present Government has been consistently the friend of reciprocity with the United States, and it is highly desirable that it should be secured before a change of Ministry.

One of the humors of the Chamberlain episode is the bugbear of an American export duty on cotton. Even the staid *Economist* mentions this as a possibility, and a group of Liberal protectionists, including the publicist, Benjamin Kidd, has delivered in the London *Times* a precious bit of economic wisdom. Dwelling on the defenceless condition of England, it fears especially that the United States cotton industry will demand protection. "The obvious form for that protection to take in the United States is an export duty upon the raw cotton supplied to our own competing factories—a contingency which we should have to meet at present without any instrument of defence or negotiation in our hands." It need not be said that the best "instrument of defence" to these embattled economists is the Constitution of the United States, art. i., section 9, where it is written that "No tax or duty shall be laid on articles exported from any State." The incident shows how grave men lose their heads when they begin to dabble in Mr. Chamberlain's doctrines of panic and retaliation. So bad a cause requires at least a modicum of information in its advocates, and Mr. Chamberlain would do well to circulate copies of our Constitution among all protectionists who are chilled at the prospect of American export duties.

As for the preferential scheme in gen-

eral, Mr. Chamberlain's denial, made to the cotton manufacturers of Lancashire, that he has proposed taxing raw materials, may mean much or little. If it means that the colonies are to receive preferential treatment only for their foodstuffs and finished products, the fabric of Imperial reciprocity would bear a very humble look. Canada would clearly profit by corn taxes, but where would the cotton of Egypt and India, or the wool of Australia and New Zealand, find their account in a tariff framed to enrich the wheat grower of the Northwest at the expense of the British laborer? Is all the talk about the colonies shoulder to shoulder, and England against the world, going to take effect merely in the reimposition of Sir Michael Hicks-Beach's tax on corn, with its remission in favor of the colonies? Will the Brummagem mountain in labor bring forth so small a mouse? It would be unwise to conclude anything of the sort from Mr. Chamberlain's denial. He has studiously avoided committing himself to anything resembling a programme, and his fiscal inquiry may bring him out anywhere. It may be safely predicted, however, that he will be as reluctant to face the country, offering it only food taxes, as he has been to bear news of cotton duties to the Lancashire spinners.

The British Foreign Office has now published the text of the treaty ratified May 27 last at Teheran. By this agreement the Shah engages to give perpetually the treatment of the most-favored nation to Great Britain. Since English commerce already held this privilege under the treaty of 1828, which fixed all Persian customs duties at a level of 5 per cent., it is apparent that Lord Lansdowne has sought merely to forestall any revision of the tariff which might offer preferential treatment to Russia. It is, unlike the recent assertion of British preponderancy in the Persian Gulf, purely a defensive move, and carries the implication that Russia has got one move ahead. How completely Russia has beaten England in the commercial contest for Persia is now a matter of history. In 1872, when that adventurer-financier, Baron de Reuter, obtained the receivership of all Persian revenues and franchises, England might easily have bought the conveyance of the whole. But the chance passed, and when finally, in 1889, the Imperial Bank was launched with British capital, its conduct of the tobacco monopoly made it quickly odious, while its control of all the maritime imposts, as security for a Government loan, has always seemed oppressive. Meanwhile, the Russians built roads from the Caspian Sea to the trading centres of northern Persia, and gained (practically bought) moral control of the late Shah, whose Anglophile son, now the Zillu Sultan, was deprived of the succession. And the present Shah is surrounded by a bodyguard of 2,000 Cossacks, commanded by a Russian who is responsible to the War Ministry at St. Petersburg. To obtain these advantages Russia has not struck a blow or issued a threat.

But even more noteworthy than the advance of Russian trade along its own roads, or the insinuation of the Czar's influence at Teheran, is the method by which the Russian Loan Bank has gradually supplanted the English Imperial Bank. Towards a debtor nation the Russian Bank has shown something of that lavishness which the Czar has exercised towards his needy "cousin," the Shah. Without making unpopular demands for security, it has practically reorganized the customs service, and particularly has done away with the rebates which were formerly given to many classes of British imports. And the Russian Loan Bank has been thrifty also in its liberality. In 1900, for example, it loaned $11,000,000 to Persia, accepting 5 per cent. bonds at 85. But previously it had raised the whole sum in Paris by floating 3 per cent. bonds at 95. As a consequence of this loan, the Russian Bank took up all the national obligations held by the Imperial Bank; ousted that institution, except in the Persian Gulf and Farsistan, from control of the customs, and established its own position as sole money lender to the State. Subsequent advances have left Persia even more deeply mortgaged to her Russian men of business.

One of Leo XIII.'s attempted services to humanity was his endeavor to avert the Spanish-American war. New and illuminating details of his efforts on that occasion are given in an article published in the *Revue Historique* for July-August. The writer, A. Viallate, has had access to Spanish diplomatic correspondence, and clearly brings out certain facts only suspected before, and not at all disclosed in the official publications of our own Government. For example, on April 2, 1898, the Spanish Minister to the Vatican telegraphed to the Minister of Foreign Affairs at Madrid that he had just had a call from Cardinal Rampolla. In behalf of the Holy Father, the Cardinal said:

"The news received from the United States is very alarming. The President is desirous of adjusting the controversy, but he is dragged along [*entraîné*] by Congress. The difficulty is to find some one who may request the suspension of hostilities. The President appears strongly disposed to accept the aid of the Pope."

His Holiness thereupon asked if his intervention would be acceptable to Spain.

The reply was favorable, and the result was that moving offer of the Queen Regent, "at the request of the Holy Father," to "proclaim an immediate and unconditional suspension of hostilities in the island of Cuba." This was telegraphed by Minister Woodford direct to President McKinley on April 5, 1898; but the latter was by that time so much further dragged along by Congress that he did not even mention the critical dispatch, nor was it deemed prudent to publish it at all until after the lapse of three years. The claim was set up that this Government had not really desired the good offices of the Pope. Another of M. Viallate's dispatches, however, shows how close we came to asking Papal intervention. On April 4 the Spanish Minister in the United States telegraphed that he had just had an interview with Archbishop Ireland. That prelate had come to Washington "on the orders of the Pope." He had seen the President twice, who "ardently desired peace," but was afraid that Congress would vote war, and that the helpless man would finally be obliged to yield. A final effort must be made, etc. All of which should somehow be commemorated in the McKinley monument. We suggest a bas-relief showing the President dragged along by Congress into a war from which he shrank, and which he might have prevented.

The outcome of the Conclave has been the elevation to the Papacy of Cardinal Sarto, Patriarch of Venice, who takes the title of Pius X. While by no means a prominent candidate, he had long been recognized as *papabile*. His strength lay partly in the fact that he was a moderate and not identified with the struggle of factions, partly in his absence from the Curia. He has spent the greater part of his life in and near Venice, and it is beyond doubt that, upon the assembling of the present Conclave, there existed a widespread feeling in favor of some candidate who should have lived well outside the atmosphere of rivalry and intrigue prevailing within the shadow of the Vatican. The new Pope was one of two or three provincial Cardinals who met this requirement, while his piety, his scholarship, and his well-known success as a practical administrator in Venice were all in his favor. To the general public he has not been so widely known. He was overshadowed by the great names of Vannutelli and Rampolla. There were, however, far-seeing persons who predicted that this battle of the giants would end in a deadlock, to be resolved only by the election of some compromise candidate who would be acceptable to all parties. There is reason also to believe that the purely physical inconveniences of the Conclave, the great heat, and the prostration of a number of Cardinals, may have tended to hasten a decision.

BAD ADMINISTRATION.

It is impossible longer to say, after the latest revelation of swindling contracts and purchases of supplies steeped in fraud in the Post-Office Department, that the scandal does not seriously reflect upon the present Administration. The ready defence made by the President's friends has been that the rascals were his inheritance, not of his appointing. Machen was put in office by President Cleveland. Perry Heath was McKinley's appointee. Only one or two minor "grafters" were named by Mr. Roosevelt. In having them and all the others hunted down and made to suffer for their crimes, he is, it is said, doing his full duty and clearing his own skirts. He cannot be blamed, it is asserted, for having entered into a *damnosa hereditas* from two preceding Administrations.

But there is more in good executive capacity than the smoking out of rogues, your own or another's. Watchful control over expenditure is the first requisite. It will not do for the head of a great department, to go on signing papers in a routine way, without knowing what is in them, or to assure himself simply that contracts are regular in form. The alert and skilled executive will go behind the face of the public business to its essential nature. He will be constantly checking off and testing the work of his subordinates. Under such a chief, with a head for business and a genius for details, it would be impossible for the Government to go on being cheated as it has been all these years past in the Post-Office.

This is precisely the point at which the Administration, and particularly Postmaster - General Payne, appear blameworthy. They could not, indeed, prevent their predecessors from harboring corrupt conspirators, but they could have detected and frustrated the conspiracy. They could have gone behind the contracts under color of which the Treasury was being robbed, and discovered, by a little inquiry, the fraudulent nature of the whole business. Only consider how plain a trail the thieves left behind them. Their operations extended to nearly every article bought by the Department. Letter-boxes and mail-bags, carriers' satchels and straps, patent devices of all kinds, cash registers and time clocks—on all these and many other purchases the pilferers laid their greedy hands and exacted their share of the "graft." But what we maintain is that the slightest investigation would have betrayed the crookedness. The contracts were all at two or three times the market price of the articles purchased. A half-dozen questions put to dealers would have shown that there was fraud. But nobody in the Department asked those questions. No one took the trouble to inspect current price-lists to find out if the Government was being bled. Merely because the papers were correct in appearance, the higher officials sat blissfully in their fool's paradise.

There, we insist, was a failure to live up to the elementary principles of good administration. A vigilant executive officer would never have allowed undetected robberies to go on for months, as Postmaster-General Payne did. He, or some trusted chief under him, should have looked into these frauds in the purchasing department long ago. When Carl Schurz was Secretary of the Interior, he struck terror into the hearts of shady contractors, and brought joy to all friends of the Indian, by going behind the ostensible dealings of the Department and ascertaining what the facts really were, what savings could be made, what leaks stopped. That was but the plain duty of an executive officer. Even Napoleon, who lived on loot and fed his generals and favorites on it, dared not let public expenditure go uncontrolled. It was his habit to go incognito to the great dealers in order to find out the actual market price of Government supplies. Then he would go to his subordinate purchasing agent and say: "See here. You are paying twice too much. I can endure stealing up to one-third of the price, but this is too much."

Without such continued executive control there was, Napoleon was accustomed to say, no safety. No administration, we affirm, can be called good that does not exercise it. When the appointment of Mr. Payne to the Post-Office, and its unhappy consequences, come fairly to be reckoned up, we do not see how reproach can fail to rest both upon him and the President who put him in office, and kept him there after a demonstrated incapacity. Suppose a man like Bristow in Payne's place; would the tricksters have gone on with such impunity under his nose? The continuing frauds, so easy of detection, glaring as they did on the face of suspicious contracts, are themselves proof of bad administration. There was the greater obligation on the Postmaster-General to prevent these losses in that the Department has so long shown a deficit. Honest efforts to make it self-sustaining would alone have led to the discovery of the enormous drain through thievery. But, no; nothing was done. A Postmaster-General was named confessedly for political purposes, though the Department cried out for a fighting business man at its head. Although the ramifications of fraud undermined his whole Department, Mr. Payne was incredulous and indignant up to the very moment the floor fell in.

The moral of all for President Roosevelt is clear. He cannot run away under cover of the laches of other Administrations. His own has been grievously at fault in not having had a Posmaster-General with a keen scent for fraud. And as the President finds himself disappointed again and again in the broken promises and unfulfilled predictions of Mr. Payne, the need of supplanting that incompetent executive with a vigorous cleanser of the Department must, we should hope, become clearer to him every day.

THE JURY TO THE RESCUE.

At the Confederate reunion recently held at Brownsville, Tenn., a Federal Judge, Hammond, spoke of "cowardice in the jury-box" as a prime cause of the trouble now afflicting the nation. He reminded his old comrades in arms that the police power and the judiciary were powerless to deal with lynching mobs so long as juries would not convict upon evidence. This nation was organized upon the expectation that the people would be responsible for their own orderliness. It was in this confidence that the founders of the Constitution left the Government without the usual police powers. And for the same reason the States, in whom the police power constitutionally resides, have practically placed it in the feeble hands of the towns and villages, with the result that the general peace is not safeguarded by a constabulary such as patrols the roads of Europe, but depends upon the good will of the community in resisting mob mania, and upon the sternness of the community, expressing itself from the jury-box, in avenging under the law all crimes against its own peace. When that zeal for the law is absent, anarchy ensues.

Judge Hammond did not flinch from pointing out the alternative. If juries shall fail to rise above factional passions and treat the mad deeds of the mob as inflexibly as they decide the matter of a trespass, then the liberties of the community will be overridden. For mob violence is intolerable in a civilized nation, and the community that palliates it only courts a more drastic use of the police power by the State. The carbines of a State police cannot replace the civic courage of sheriffs and jurymen, but they can at least subdue by fear a community too demoralized to redeem itself by virtue. And there is a further danger, namely, that entire States may show themselves maniacal or pusillanimous where the evil passions of the multitude are engaged. In such case the nation would not long consent to be bound by the constitutional limitation of the police power; the bayonets of the regulars would enforce quiet where the State had failed, and the volleying of their rifles would signalize the downfall of a form of government too liberal for the unworthy citizens who enjoyed its privileges. Such in effect were the words that Judge Hammond spoke to his old comrades of the Confederate armies. They are the words, not of an alarmist, but of one who has seen the situation judicially and who foresees like a true patriot a

peril which the people must rouse themselves to avert.

The approbation with which his words were received must be taken as the sign that he required of jurors no impossible wisdom and fortitude. When twelve men are called together to pass upon the deeds of a man who has enslaved or cruelly slain the members of a despised race, they are no longer merely twelve individuals of the careless multitude that minimizes the wrong. Sworn to find upon the evidence, they speak the considerate voice of the community, that by which it must consent to be judged. This conviction it was that gave poignancy to Judge Jones's cry, when a jury refused to convict on overwhelming evidence in a peonage case. He exhorted the divided jurors that it would be said that a negro could not obtain justice in the State of Alabama. The corollary of this appeal Judge Hammond furnishes. It is that the community which will not render justice to the meanest of its citizens, cannot long retain the right to self-government.

The matter affects all parts of the country alike. The State of Indiana has brought some of the Evansville rioters before the courts; if the jury wriggles out of its responsibility of treating as public enemies those who defy the law, how will the condition of Indiana be better than that of Delaware or Alabama? Cowardice in the jury-box can bring to naught the heroism of Sheriff Whitlock, the patriotism of Gov. Durbin, and the energy of the prosecuting authorities. How shall we find jurors who will rise above sentimentalism and passion into an inexorable vision of the facts and an unfaltering performance of their sworn duty?

Clearly much may be done when our best citizens realize that to sit in the jury-box is to occupy the firing-line of our civilization. This post of honor should be sought, not avoided. Judges may do much to instil this sentiment, by refusing to accept frivolous excuses and to entertain the unnecessary objections of counsel. But even more may they give tone to their juries by setting forth the momentousness of their responsibility, and by presenting an inexorable front to their vacillations. In this respect Lord Russell of Killowen's conduct of the Jameson case was a model for all our judges. About the criminal adventure of "Dr. Jim" all the passions and prejudices of London gathered. The universal sentiment was for the weak and lenient policy. The jury hated to convict. It was precisely the situation that exists in the South when a white man is tried for peonage, or anywhere in the country where an amateur of that popular sport called lynching is arraigned. Under these circumstances the Lord Chief Justice thought it fitting to show the gravity of the charge. He said in addressing the jury:

> "In most criminal charges the consequences following upon the commission of the offence or crime charged terminate upon the completion of the acts which constitute the offence. Unhappily, however, in this case that is not so, and the offences charged may possibly entail consequences the end of which no one can foresee."

Certainly these words are applicable to every offence against public order and should be pronounced in every such case.

It will be recalled that when the Jameson jury found on all the facts charged but refused a verdict, and attempted to enter a rider recognizing "great provocation" for the raid, Lord Russell sternly refused to entertain their remarks, declared that their finding was equivalent to a verdict of guilty, and bade them report accordingly. It was an extraordinary instance of a wavering jury called back to its duty by an inflexible judge; the just verdict of guilty was reached without leaving the courtroom. Much of the reform which Judge Hammond rightly regards as necessary to the very existence of the State may be brought about by wise and fearless judges. The rest must be entrusted to a public sentiment that will treat cowardly jurors with contumely. We are glad to observe a readiness in the Southern press, commenting on Judge Hammond's appeal, to help create that sentiment.

BANK CONSOLIDATION.

The August *Atlantic* has an article by Prof. Charles J. Bullock on "The Concentration of Banking Interests in the United States." He takes, for purposes of illustration and comment, the drawing together of certain groups of banks and trust companies in New York city. They represent in part consolidations and in part affiliations. The two most conspicuous groups are under the dominance of the National City Bank and of the First National Bank, respectively; but these institutions are under the control of individuals whose chief business is not banking. The "Standard Oil crowd," so-called, are considered the most potent force in the councils of the National City Bank. The firm of J. P. Morgan & Co. is presumed to be the most influential voice in the other institution named. The two controlling groups are financiers, promoters, reorganizers, underwriters, and so on, rather than bankers. The National City group is supposed to have within its sphere of influence banking capital and surplus amounting to $92,000,000, deposits $377,000,000, and loans $266,000,000. The First National group, if the Bank of Commerce and its affiliations are included, stands for $97,000,000 of capital, $472,000,000 of deposits, and $299,000,000 of loans. These are the figures marshalled by Professor Bullock, but he acknowledges that they are partly guesswork. Probably the totals exceed his estimates, but actual control may be subject to some contingencies that do not appear on the surface.

These two groups are not the only ones formed or forming in the United States. There are others in New York and in other cities and States. They represent a movement of the financial waters. The questions raised by Professor Bullock and discussed by him with fairness and intelligence relate to the motives underlying this movement, and to its probable effects on the business of the country. He properly dismisses the thought that it can lead to any such thing as monopoly in banking or in money-lending. Those who talk of a "Money Trust" are either seeking the votes of ignorant people, or are deluded by their own catch-words. Money is the most mobile of the elements of trade and industry, and the least liable to be concentrated in a few hands. The money of Berlin can be loaned in New York on one day's notice, and vice versa. The money of the most obscure person in the world will be as readily taken and will command as good rates as that of the Bank of England. Any five men of good character in the United States can start a national bank with $25,000 capital, or more. They can start a State bank with $10,000, or even less. Any man may start a private bank to-day with as little ceremony as that observed by the goldsmith bankers of the Middle Ages.

It should be remembered, too, that money cannot be monopolized in the sense of withholding it from use, except at a loss to the monopolizers. As long as they hold it they lose the interest. As soon as they part with it they cease to monopolize it. The most that can be said on this score is that those who have large sums under their control can avail themselves of opportunities which sometimes occur to make large gains. This involves the exercise of judgment in the choice of investments, and if mistakes are made the expected gains may prove to be losses. There have been some notable cases of the latter kind recently in the affairs of the Consolidated Lake Superior and of the International Mercantile Marine. If money had been less plentiful, probably neither of these enterprises would have afflicted the present generation.

The chief motive prompting the bank combinations treated in Professor Bullock's article undoubtedly lies in the promoting, underwriting, reorganizing and speculating rage of the present day. Any man or group who can command vast sums of money at short notice, has a great advantage in affairs of this kind, since the persons or governments who have railroads to build or rebuild or extend, or mines to develop, or forests to exploit, or bonds to negotiate, go to them. They have the first pick of new enterprises because they are able to close a trade with cash down. By controlling a bank or a number of banks of large resources they can virtually direct the officers to underwrite the securities which

they expect, a little later, to sell to the public at an advanced price. Presuming that the two groups of capitalists named in Mr. Bullock's article have gained this commanding position, what has banking science to say about the matter? Are the tendencies for the public interest or otherwise?

It is not for the public interest that power should be separated from responsibility. In the case supposed, the power to dispose of the bank's funds, its credit, and its loans does not reside with the officers, but somewhere else—nobody knows exactly where. They transact its ordinary business and are supposed to treat all customers according to their deserts from the banking point of view, yet in extraordinary business and in extraordinary times they are not the masters of their own institutions, since there are persons elsewhere who can turn them out of their places. These persons are not ordinary shareholders, but large and imperative borrowers. The bank officers are responsible in the eye of the law and of public opinion for the prudent management of its affairs, and may be sent to prison for mismanagement, but they are fettered by an unseen power which they cannot resist. The safety of the bank in such a case depends not upon the prudence of its managers, but upon that of borrowers who are able to dictate their own terms. Such arrangements are in conflict with banking science.

PERSUASION WITH A CLUB.

Mr. Chamberlain was more adroit than accurate when he said last week that England would never have got the Continental sugar bounties in the way of being abolished, had she not threatened retaliation. British dislike of the bounties had something to do with the case, no doubt. They cry of the West Indian cane-growers had more. But the really effective destroyer of the bounties was the huge burden of taxation which they imposed on Germany, France, and Austria. The people and rulers of those countries had awakened to their own folly. They were producing enormous quantities of sugar, but all for the benefit of the foreigner. They sold it cheap abroad, thanks to the bounties, but at home the price was high and the consumption restricted. As Professor Sumner once put it, the Continent had the industry, but England had the sugar. The inherent absurdity of this policy, together with its enormous cost to the public treasury, had more to do with the abolition of sugar bounties than had the English threat of countervailing duties.

But it is not sugar, of course, that Mr. Chamberlain cares for now. He is trying to convince the British electorate that the way to get favorable tariff treatment abroad is to bluster about unfavorable treatment at home. "You see," he says, "how well retaliation worked in the case of the sugar bounties. Just let me have free swing with the same club, and I will speedily bring Germany and the United States to their knees." This is very taking, but it is an argument which will not bear examination in the light of either human nature or sound fiscal policy. Mr. Carnegie has, in fact, already told the English public what would be the sure effect of retaliatory tariff legislation directed against America. It would entrench our protectionists. High duties would be pushed higher. National sentiment would be skilfully inflamed and made use of to meet all reprisals with more stringent ones. We should at once hear talk about starving England or shutting up her cotton mills. This would be very foolish, of course, but it would be very natural. The course of things a hundred years ago, when successive orders in council fought with Napoleon's decrees, should have warned Mr. Chamberlain that countries can be as insensate and ferocious in a trade war as in one with fleets and armies. It has been said that a nation is capable of any folly, provided it be military. It might safely be added—provided that it be a tariff folly urged on by passion.

It was doubtless a perception of this truth which led Mr. Schuster of the Union Bank of London to speak the other day in opposition to any tampering with free trade in England. He is one of the highest financial authorities of the day, and has a singularly wide acquaintance with conditions in the United States. To him it is clear that our tariffs are in a fair way to be reduced by force of circumstances alone. Mr. Schuster's citation of a remark to that effect, privately made to him by Mr. McKinley, is, of course, only of a piece with what the late President said repeatedly in public during the last weeks of his life. Many of our high-tariff duties are simply humbugs; many are noxious; many are a distinct hindrance to that foreign trade which our manufacturers are more and more anxious to cultivate. Inevitably, as President McKinley said, "our tariff must be reduced"—if, that is, pugnacity is not added to folly by the swish of Mr. Chamberlain's club.

The truth is, that angry words and ugly deeds are most out of place in trade discussions. You cannot force people to buy of you. It will not do for nations to attempt to secure business by knocking down their customers. Trade may follow the flag, but it certainly runs away from the club. It is easy to interfere with an established commerce by meddlesome and offensive tariffs, but to build up trade by means of retaliation is impossible. Trade must be unforced, and founded in the mutual advantage of at least two parties, if it is to exist at all. A people with the true trading instinct perceives that the main thing is to keep commerce flowing in its natural channels. It knows that it can take toll of every argosy that it invites. The moment you begin to talk of the need of protection, that moment you confess that you are beaten and have to ask odds. Mr. Chamberlain's "retaliation" is ambiguous. He does not mean, he says, really to apply it; he desires it only as a means of forcible persuasion. But true protectionist retaliation, as we see in the case of our own countervailing duties against bounty-grown sugar, looks to keeping out the dangerously cheap article, and making the duties so much the more a sweet morsel for selfish interests. That is the kind of thing Mr. Chamberlain will have to come to if he once departs from the tried maxim of Sir Robert Peel. That statesman never allowed his feet to be taken in the snare of retaliation, but maintained that "the best way of fighting a hostile tariff is by reforming your own."

THE COLLEGE BEAUTIFUL.

It has just transpired that a company of Harvard graduates has been formed to buy the land between the college yard and the Charles River and control it in the interests of the University. The idea of thus securing a frontage upon the river was broached nearly a dozen years ago by an alumnus, but fruited in nothing more than a sketch for the laying out of such grounds, prepared by Mr. C. F. McKim, which for some time hung in the Treasurer's office. The times were hard, and the expense seemed prohibitory. For two centuries and a half Harvard has grown, or rather sprawled, out from Massachusetts Hall as a centre. Fine buildings have been the exception, and as they came they were planned and placed without regard to the others. Only recently efforts to put the hodge-podge under a commission which at least might direct future building wisely, met with scant encouragement from the Corporation. Thus the public-spirited action of her graduates comes as a kind of rebuke to the official indifference of Harvard University to considerations of academic seemliness; it is a sign as well that the haphazard period of college building in America is passing.

This truth is the burden of Professor Hamlin's interesting article in the *Outlook*, in which he reviews recent progress in American college architecture. We need only mention among comprehensive schemes those of Columbia, the University of New York, Chicago, and Stanford. Planned, but not yet fully executed, are similar groups for Washington University, Mo., the University of California, the College of the City of New York, and the Military Academy at West Point. The list of new buildings at old colleges would be inexhaustible,

and only the barest notice can be taken of the notable progress of Princeton and the University of Pennsylvania in this direction.

It is interesting to observe that the movement for better college architecture has been largely extra-academic. Enlightened graduates and their architect friends have generally brought such matters before college authorities, and have frequently planned and paid for the desired improvements. Naturally these innovators found their best opportunities in the newer foundations. Where a plan involved hundreds of acres of land and a score of buildings it seemed reasonable to employ the best skill. Mrs. Hearst, for example, obtained the plans for the University of California through an international competition. All this would have seemed strange, indeed, to old-school college presidents. Those pioneers, when the college grew, bought a new lot where they could, and put up such a building as the local carpenter and mason could furnish. Few colleges were fortunate enough to have a president like the Rev. Dr. Griffin of Williams, who designed the simple and admirable structure that still bears his name. In the main, as the Georgian style waned, all manner of quasi-Gothic or merely nondescript halls succeeded, so that the irregularity of the whole plan of a college was frequently less offensive than the general incongruousness and individual bad taste of its buildings. There were honorable exceptions, to be sure. We have hardly yet surpassed the standard that Jefferson set in the University of Virginia, of which his words, written in 1821, still hold: "I can assure you," he says, "there is no building in the United States so worthy of being seen, and which gives an idea so adequate of what is to be seen beyond the Atlantic. There, to be sure, they have immensely larger and more costly masses, but nothing handsomer or in chaster style." How slowly this example was followed, and how little progress had generally been made in the course of half a century, may be gathered from the words of one keenly sensitive to architectural excellence, Mr. James Bryce. Writing in 1888, he remarks: "Many of the newer ones [buildings] are handsome and well arranged." To-day, after twenty-five years there would be rather more to say.

Surely, the haphazard plan of our colleges, while often an immediate defect, is also an opportunity. Mr. Bryce attributes the multiplying of isolated buildings to our climate. In any case, the group of buildings with spacious grounds is quite as definitely the American plan for a college as the quadrangle is the English or the single monumental pile the Continental. Our problem is to harmonize the buildings with each other and with the natural features of the site. Thus landscape architecture is quite as important as her more formal sister. And there are opportunities for most charming composite effects, which should challenge the combined ingenuity of architects of both sorts. In Professor Hamlin's article there are no more interesting illustrations than those of memorial gateways guarding shaded alleys, at Bowdoin and Oberlin. We have before us as we write a dignified plan by which, in all future building, Washington and Lee University is to get the full advantage of its fine site. Williams College, after lining her park-like street with too many ugly or stupid buildings, is at length going to repair damages as far as possible and do better for the future. Amherst, with less to undo, is, by a recent class movement, setting about a similar task. These are typical cases out of many that might be cited.

Let no one say that this is merely a sign of the luxuriousness of the times. It is only ignorance or vulgarity that associates architecture with lavish expenditure. Jefferson's dome and colonnades at Charlottesville were inexpensive, even for their time. Respect for the natural beauty and architectural possibility of its site is the measure of the culture of an institution. The seemliness of its buildings denotes its intellectual atmosphere quite as plainly as dress betrays the wearer. It may fairly be urged that the formal education given at our American colleges has too much lacked grace and too little ministered to well-rounded culture. From this point of view, the stately buildings that are rising and the fair stretches of green and thicket and grove about our colleges are parables of the finer and more humane education that is to come.

OUR THEATRICAL DISPENSATION.

Whatever may be thought about the Theatrical Trust, it is impossible not to admire the executive skill and comprehensive grasp of its leading spirit. He has succeeded in practically consolidating the English and American stages, or, at all events, in making one set of entertainments serve for both sides of the Atlantic. This enlarges profits indefinitely, while greatly reducing the number of original productions, with all their varying elements of risk and cost. Never in the whole course of its history has the stage, from the box-office point of view, rested upon so solid a business basis.

Like many other monopolies, the Theatrical Trust, or Trusts—for there are more than one—started from small beginnings and developed by simple means. The first step was to secure a chain of theatres, and the second to provide a sufficient number of popular plays to keep the circuit full. From the first the men in control adopted the policy of taking as few chances as possible. They did not pretend to be prompted by any other ambition than that of making money. Let others dream of the elevation of the stage, the encouragement of literary and dramatic art, and the creation of a national school of dramatists and actors; their aim was to gratify, not to direct or improve, the public taste, and straightway began the search for conspicuous public successes of every description, with the wholesale importation of foreign men and material. A little later set in the process of the manufacture of stars, and the employment of authors skilled in dramatic tailoring, to fashion parts in which these extemporized geniuses might be displayed to the least possible disadvantage.

Few persons, perhaps, outside of those who have watched it, and feared it, and denounced it from the first, had any idea of the ramifications or power of the largest and most notorious of these theatrical organizations until Mr. Charles Frohman came home the other day, and, like a god, holding in his hands the gifts of good and evil, revealed to us the measures which he had devised for our winter's entertainment. His schedule, regarded merely as a business summary, is a most striking illustration of American keenness, energy, and business aptitude. It contains samples of everything that is offered in the contemporaneous theatrical market. Nor can he be accused of making injudicious selections. He seems to have secured nearly everything of known good quality that was to be had, and certainly deserves credit at least to that extent.

There are some very attractive features in his latest programme, together with much patent trash. Among the former must be included the two Phillips plays, "Herod" and "Ulysses"; Barrie's comedy, "The Admirable Crichton"; Davies's "Cousin Kate," the as yet unnamed comedy by Pinero, and the French piece "Crainquebille." There are also the promised pieces by Clyde Fitch, Augustus Thomas, Anthony Hope, Haddon Chambers, H. A. Jones, Capt. Marshall, and H. V. Esmond. Some of them, certainly, ought to turn out well. Upon the Sardou play "The Sorceress," professedly devised to give full play to all the wiles and furies of the later Bernhardt, it would not be wise to build much expectation. Better things are contained, probably, in the French plays by Henry Lavedan and others which Mr. Frohman owns. One of these is an adaptation of Poe's madhouse story, "The System of Dr. Gondron," which is being done into English by Richard Harding Davis. In addition to all these there are a number of so-called musical comedies, a collection of Drury Lane and other melodramas, and various plays, new and old, which may be catalogued as nondescript. Moreover, Mr. Frohman will superintend, as usual, the movements of an army of assorted stars of diminishing brilliancy from Sir Henry Irving down.

Now all this, at first sight, makes a very remarkable showing, and doubtless indicates a season of more than ordinary interest. But it is not very inspiring when any one begins to sum it all up and asks what it means. In the first place, it goes far to justify the worst apprehensions of those who from the beginning have understood and dreaded the tendencies of syndicate management. It is plain that the chief sources of miscellaneous drama—including poetic tragedy, problem plays, social comedies, melodrama, farce, and musical extravaganza—have come under the control of a theatrical commercial autocracy. Its policy is to limit the output, so far as possible, to the amount which is needed to supply its circuit of theatres, which includes practically the whole theatrical territory between London and San Francisco. There is no pretence of encouraging or looking for new literary talent. The essential element of real management—critical discrimination—has been eliminated altogether. The new plan is simply to provide a wider field for the exploitation of a popular success, no matter what the nature of that success may be, whether dramatic, sensational, lascivious, humorous, or frankly idiotic. Such pieces as have won favor in London, Paris, or Berlin, are transported in bulk a year or two later—having been kept in cold storage meanwhile—to American theatres corresponding in general character with those in which they were originally presented. The best comedies go to one set of houses, the second-rate to another, the melodramas and spectacles to a third group, the musical farces to a fourth; and in this way plays of inferior value, or no value at all, are kept alive for many months, instead of a few weeks. No doubt any syndicate manager could tell you what piece will be running in any designated house in his circuit in March, 1905.

In one sense, this is good business, and there can be no question that the scheme has been worked with great sagacity and rare executive ability. But what is the present effect of it and what will be the inevitable outcome? All wholesome competition has been killed; the American theatre, as a national institution, has been smothered in its cradle; ambitious dramatists—except the few who "arrived" years ago or have learned to write to order—have lost their occupation; the race of trained actors is almost extinct, and New York has to put up with frequently inferior performances of imported plays. The result, we believe, will be a grand crash when the erection of new theatres and the creation of opposition circuits, already begun, shall render the maintenance of a monopoly impossible. Succeeding the wreck, will come a period of chaos, in which the struggle for bare existence by individual actors and managers will lead to the renewal of competition and the reappearance of the stock companies; without these there can be no theatrical redemption. The day may be distant, but already there are signs of its dawn. Meanwhile, until we are able to spread a dramatic table of our own, we must philosophically enjoy the crumbs which fall from those of our richest European neighbors. Common justice compels the admission that our theatrical *deus ex machina* has garnered for us many of their daintiest morsels.

EGYPT.

CAIRO, 1903.

It is more than fifty years since Said Pasha, his family, and his friends, when endeavoring to absorb as their personal possession the land of Egypt, introduced large steam engines to irrigate their huge estates, and sugar factories to work up the product of their ill-gotten possessions; yet the small proprietors have till recently persistently adhered to all their ancient ways. But now, side by side with the sakieh or old-fashioned waterwheel, raising its string of earthenware jars with a dreamy, snoring groan as the drowsy cow or buffalo revolves it, or beside the still more archaic suspended pole or shadoof, balanced with a counterpoise of mud to assist the fellah in raising his leather bucket full of water, one sees occasionally a small portable boiler and steam pump. Still, steam is at a discount, for in 1897 there were in Egypt, raising water for irrigation, 622 stationary steam engines, 3,352 portable engines, 104,855 waterwheels moved by animal power, and innumerable shadoofs. Though the portable boiler and steam pump do more work than a village full of toiling peasants, yet as each proprietor of a little plot can raise what water he actually needs for his own crops, it could be only through coöperation that a steam pump would pay. Such an advanced stage of industrial life is still a long way off. Thus the picturesque will continue to resist for many a day the assaults of utilitarianism, and the common avocations of their ancestors for ages past, as depicted on the tombs, will continue to be repeated for generations to come in actual life.

The narrow strip of land on the banks of the Nile which constitutes Egypt has probably always been owned and worked under some tenure in small holdings. Today, of the 5,097,431 acres of arable land inscribed on the Government register, 43.47 per cent. are held by 11,952 so-called large proprietors, controlling over fifty acres, and 56.03 per cent. are held in lots of under fifty acres. Of the small proprietors, more than 600,000 own less than five acres. Among the large proprietors are several public companies which have acquired the Deira and other public lands only as brokers, and on conditions that require disposing of them in small lots within a given period to actual farmers; the object of the Government being by this as by other measures to encourage and assist the peasant proprietorship. A farmer with from one to ten acres—and ten acres is a large farm—will continue to raise water for irrigation by hand or ox power, as his forefathers have always done. Thus the past will be ever present.

If one wishes to breathe the atmosphere of ancient and of native modern Egypt, shun the tourist steamboat and take one of Cook's express boats. The first shock you receive is the blast of the whistle as you throw off from the first landing-place; the next is the babble of voices in the hot, close dining-room; the third is when you are herded like a flock of cattle and driven through tombs and temples under the lash of the dragoman lest you miss or detain the boat. After the first night passed with all the equanimity you can muster in a cupboard, without even a shelf to lay a book upon, comes the awful scramble for three baths by thirty or forty male passengers, some of whom consider themselves entitled, after such a struggle, to retain possession for half an hour. And so the journey proceeds, with irritation increasing with the distance travelled, and reaching its culmination at the First Cataract, where some of the passengers would be glad to escape by rail or by balloon, but find, if they have taken tickets for Wady Halfa, they must repeat the process or forfeit their money. Cook very wisely, and with perfect justice, sells his tickets with the express proviso that there shall be no refund: wisely, because some passengers, after the ordeal they have gone through, would go no further; justly, because the capital invested in the fleet of boats, which are in commission from December to March only, is large, and the service is liberally and admirably conducted, considering the difficulties of providing supplies, with no good local markets to draw from, and the high cost of fuel.

The better plan is not to book in advance for a round trip to Wady Halfa by any tourist steamer, but to take the journey by instalments, and run the slight risk (which certainly does exist, but only in the height of the season) of not being able to get a passage by one of the three boats between the First and Second Cataracts, if you are going as far as Wady Halfa, or, further still, to Khartum. There are now excellent hotels at Luxor and Assuan, which only in the very busy season are overtaxed. A railroad with *trains de luxe* between Cairo and Luxor skirts the Nile bank, and gives access to most points of interest. Cook runs three classes of boats, and two opposition lines compete with him for the passenger traffic to Assuan, and therefore it is unwise to commit yourself beyond hope of repentance by deciding on any plan of travel when Cairo is reached, and still more so to pay in advance for your ticket. Of course, if time and money are of no consequence, the dahabieh, without the horrid appendage of a steam launch, is still, and ever will be, the ideal mode of Nile travel; though, now that the Assuan Dam has converted the Nile for nearly the whole distance between the First and Second Cataracts into a lake during the tourist season, dahabieh navigation over this stretch of the river without a steam launch is very slow and precarious, because dependent on the winds. The tow-paths on the banks are submerged and the current has been arrested. Nevertheless, it is only on the dahabieh that, with your native dragoman, cook, and crew, you can keep aloof from the big hotels, with all their reminders of the busy, electrically-lighted, artificial world which you have left, come in

touch with modern Egypt, and get some faint conception of that very old Egyptian civilization and its people.

Fifty years ago, Cairo was a beautiful Eastern city, third in rank after Damascus and Constantinople. Around the old cemetery of the Ezbekiyeh, which Napoleon during his expedition of 1798 offended Arab susceptibility by turning from a graveyard into a garden, had gathered a European quarter. But there was only one street opening from the Ezbekiyeh to the citadel of Mohammed Ali through which a wheeled vehicle could travel. Now, in cutting streets for carriages and tramways, some of the finest architecture of the old town has been demolished, and gaping interiors and tottering minarets of mosques implore the lover of the picturesque to select the site for new streets at least with some regard to the claims of antiquity. One of the charms of the narrow streets of Cairo still resides in the exquisite wooden balconies protruding from the second stories and almost meeting midway. They shielded the passer-by from the fury of the sun while delighting him with the beauty of their design, and they enabled the ladies of the harem to see without being seen, and to gossip with their captive friends in their pretty cages opposite. Perhaps not without reason, the authorities, recognizing the danger to which these beautiful balconies expose the city from fire, have forbidden that any new houses be provided with them, while permitting existing balconies to remain. Thus, one after another of the architectural features which made Cairo so attractive is vanishing at the behest of money-making corporations or the exigencies of public safety.

Alexandria is of course more modern than ever. It never was a purely Oriental city. Founded by Alexander the Great, it was more Grecian than Egyptian. In the middle ages it was a Levantine depot. After the Portuguese opened up the route to India by the Cape of Good Hope it dwindled into an insignificant local port, and so remained until it came in the fourth decade of the last century to be the transfer station of the P. and O. steamers of the mails and passengers to and from India. When that astute founder of the present Khedival dynasty, Mohammed Ali Pasha, linked it to the Nile by the Mahmudiyeh Canal, it was the only seaport of Egypt capable of accommodating a large ship until, on the opening of the Suez Canal, Port Said, its Mediterranean terminus, threatened to become a dangerous rival. But the trade of Egypt has grown with such rapidity that, despite the traffic deflected to her competitor, Alexandria has increased in prosperity and in outward appearance beyond all anticipation. The bombardment of 1882 and the destruction of property by the incendiary fires which followed, swept away the original Frank portion around and including the huge open space known as the Grand Square of Mohammed Ali, which fifty years ago was a lake during heavy rains and a dusty plain in dry weather, surrounded by ugly barracks that accommodated the principal business firms, and approached by narrow streets bereft of all Oriental beauty and offering none of the conveniences and sanitary advantages of the West. But there stands debited to the Special and General Reserve Fund as an extraordinary expenditure an item of "Alexandria Indemnities," amounting to £4,143,956. As the Alexandria of to-day shows, there was thus returned to the sufferers from the bombardment and the conflagration an ample sum with which to rebuild the European quarter, and it was evidently used on brick and mortar, and must have been supplemented by a few millions more, for the European quarter, with its present wide streets and handsome shops, and the European suburbs in the direction of Ramleh have so overshadowed the native town that Alexandria is more than formerly a Western city. The native quarter possesses no interesting features and never did. Even the native ladies prefer the European shops and European dress, including high-heeled shoes, to their own bazaars and graceful native costume.

The harbor facilities and the safety of the port have been increased, a sea wall nearly two miles in length being only one of the recent improvements. But these have not been in excess of the requirements of the increasing traffic, for of a total of £14,814,688 of Egypt's imports in 1902, £13,093,017 came in through Alexandria, and of the £17,617,003 which Egypt sent into the markets of the world, £17,186,324 was shipped through Alexandria. Though the business of Egypt is transacted in and through Alexandria, Port Said draws the passenger traffic, and comparatively few travellers now see Alexandria, but are obliged to receive their first impressions of the land of the Pharaoh and the Khedive from the moral and physical filth of the mushroom, pasteboard town of Port Said. None of the boats with through passengers to the East now touch at either Malta or Alexandria, as they did of yore, and only tourists and Mediterranean coasting steamers discharge or receive passengers at what is the most interesting survival of the Old World's great mercantile marts.

One of my earliest experiences of the land of the kourbash was on the Mahmudiyeh Canal. Just after leaving Alexandria a freight boat interrupted the speed of the Government steamer conveying the Indian mails and passengers. It did not accelerate our journey, but it exhibited to his passengers the power and authority of the captain, when he had the unfortunate *reis* of the freight boat brought on board, held down and bastinadoed, to our helpless indignation. Such an exhibition of reckless cruelty could not be given to-day; still, the stick and the rhinoceros whip are in everybody's hand, and each class seems to think it inconsistent with its dignity not to whack away at the class below it. Summary punishment is perhaps preferable, even to the criminal, to punishment after the ordeal of a trial; and therefore it was probably on that principle that for a slight offence we saw one of the excellent force of mounted guardsmen seize a lad and hold him while the dragoman with his cane imposed light condign punishment. There was at any rate a recognition of the sanctity of law in the person of one of its officials. But in the old days, until the English occupation, the indiscriminate use of the kourbash was a lesser evil than the inhuman use of the corvée, or forced labor on public or privileged official works, and the wholesale compulsory enlistment of the villagers into the army. The Mahmudiyeh Canal—a work of the greatest public benefit, which Egypt owes to Mohammed Ali, and which, until the introduction of the railroad, and later until the Suez Canal was dug, enabled Egypt to be used as the highway to India—was constructed by forced labor at the cost of 30,000 lives. Even the Suez Canal was for a time dug on the same oppressive system. Said Pasha undertook to provide the Suez Canal Company with 25,000 laborers, to be replaced every three months by a fresh relay. They were to be paid and fed by the company, but the wages were a pittance and the food not overabundant, and the sanitary arrangements worse than defective. The results were so appalling that Ismail Pasha was moved to cancel that clause of the contract, but on conditions so onerous to his poor people that his merciful intervention simply shifted the burden from one shoulder to the other. Emperor Louis Napoleon, to whom was left the assessment of the damages, decided that £3,360,000 be paid to the Canal Company as compensation.

One of the first ameliorations in the condition of the peasantry after the occupation was the partial abolition of the corvée. From time immemorial everybody had been forced to do his share in cutting irrigation canals, cleaning them annually from the accumulation of mud deposited during the high Nile, and protecting the banks of the river. Certain privileged classes had obtained exemption, and through similar influences even public labor was expended on private property. Every male from eighteen to fifty years of age was liable to serve, and one-fourth of the total male population were expected to give their labor gratuitously for forty days each summer. But as so many exemptions were secured through corrupt influences, the burden fell with crushing weight on the helpless peasantry. To-day the only enforced labor is that required to protect the banks of the river itself during the flood, and this is more equitably imposed than formerly; and if Sir W. Willcocks's suggestions are carried out, it will be called for only when the flood is excessive and approaches the danger mark. In 1902, 4,970 men were obliged to give this gratuitous service for 100 days; but it was a low Nile year. Of course the suppression of the corvée and the payment of labor for cleaning and maintaining the irrigating ditches and reservoirs and for other public work has added about £400,000 to the expenditure side of the annual budget. Taxation is still inordinately heavy, because Egypt's debt is large out of all proportion to the resources of the country or the number of the population. An annual tribute to the Sultan was promised, which has imposed on the revenue of Egypt during the last twenty years a payment of over £13,000,000, or £665,000 a year. In spite, therefore, of a reduction in the rate of interest, through conversion of certain securities since Egypt's credit has revived, 48 per cent. of Egypt's revenue is absorbed by interest on debt and tribute to the Porte, and only 52 per cent. is available for administration and for public works.

Foreigners now no longer enjoy the unfair exemption from taxation which they once possessed, and the policy has been to relieve the fellah, or farmer, as much as possible without injustice to other interests. As a result of these ameliorations in the lot of the fellahin, there has been a marked improvement in the general air of

prosperity along the banks of the river, as well as in the fellah's personal appearance. His mud hut is the same as of yore, and he is clad with the same scanty garments; but both are suited to the climate, and he will be slow in discarding either. On the other hand, relieved from the fear of unjust requisitions, he has planted date trees in such number that, instead of an occasional grove, the river is now almost fringed with them, and the number of young plantations expresses his sense of security from the future. There is still a tax on every date tree, but he knows that his will not be counted twice and his neighbor's overlooked. Like all peasantry, he is an inveterate borrower, and there are usurers willing to lend, even on the security of next year's crops, at 2½ per cent. per month. But the Agricultural Bank is starting agencies in all the little hamlets, and lending money to all worthy creditors at an equitable rate. The Government has guaranteed 3 per cent. on the capital of the Agricultural Bank, an offshoot of the National Bank of Egypt, on the condition that it start such branches in the small agricultural towns and lend money in petty sums to the fellahin at 9 per cent. The results of the operation of the bank in 1902 are curious, as showing the small scale on which the small farmer works. Savings banks have also been opened and are well patronized, but not by the fellahin.

Compulsory enlistment is still necessary to recruit the army of 18,000 men which Egypt seems to need, but the same drastic measures, involving vicarious punishment in case of failure to supply the quotum or of desertion, are no longer resorted to. In the old days the sheikh of the village was responsible for the appearance of the recruit. If he failed to report, one month was allowed the sheikh to find him. Failing to produce him, he had to find three substitutes, and, failing that, he had to undergo personal punishment. If a man deserted, his family was also held responsible for his return, and a relative had to take his place in the ranks, or the next of kin was compelled to pay £100, which meant absolute ruin to the small landholder. The old army was a slovenly, ill-drilled, ill-paid, and spiritless body, whose inefficiency as soldiers was painfully manifest when Hicks Pasha and Baker Pasha's large commands were annihilated by the dervishes. The officers were hardly distinguishable from the men. To-day the army and the constabulary are neat in their dress and smart in their bearing, and both officers and men proved their courage in the last Sudan campaign. But whether the villager is any better pleased than formerly to leave his house and serve five years with the colors may well be doubted, though one sees fewer men with one eye or the trigger finger amputated than formerly, when, in addition to these mutilations, the absence of the front teeth, with which the end of the cartridge was bitten off, was very noticeable.

A feature of Egyptian life which a certain class of the people regard as a hardship, not as an amelioration, has almost entirely disappeared with the abolition of slavery. Fifty years ago the black slave market in Alexandria and Cairo was a show place open to all comers. That in which Georgian and Circassian girls were for sale was accessible only to intending purchasers or those with special admission. Within ten years from that date Egypt had agreed to the abolition of slavery, but slave boats descended the Nile with their cargoes of human beings without any pretence of concealment. Gradually, however, the force of European opinion and the necessity of propitiating it compelled the Egyptian Government to sincerely endeavor to repress the trade. At the same time Gordon's active measures in the Sudan cut off the supply. Abolition was to be gradual. Lord Cromer reports in 1902 94 males and 144 female slaves as manumitted; but that slaveholding is still adhered to with all the tenacity of a native habit is indicated by five convictions for kidnapping.

BALZAC'S PERFUMER.

PARIS, July 14, 1903.

Powerful as was the imagination of Balzac, it has been proved in recent times that the great novelist of the "Comédie Humaine" always found his heroes and heroines in real life. He used his human documents with the utmost freedom, but he never dispensed with them. Thus it is that his own life and its numerous incidents are intimately connected with his works; that there is such an intense sentiment of reality in his novels; that the actors in the "Comédie Humaine" are so alive that we cannot help remembering them as our personal acquaintances.

M. Lenotre, who lives among the archives of the police, has made curious discoveries about the royalist intrigues of the time of the Consulate, a period which furnished Balzac with elements for some of his greatest works:

"His heroes," says M. Lenotre, "are true, so true that, in looking over the police reports of the time, we think we see them appear before us, and we name them as they go by. This one is Marche-à-terre (a Chouan); this one is the councillor of state Malin; there is the *mouchard* (spy) Corentin; there is the heroic Michu, the noble damsel D'Esgrignon, the brothers Simeuse. Ah! how he knew them and painted them! What history can compete in truth with his novels!"

There is a novel of Balzac's, 'César Birotteau,' whose hero is a hairdresser. He was also mixed up with royalist intrigues and conspiracies. The art of hairdressing received a terrible shock at the time of the Revolution, when wigs were abolished as forming a part of the old régime. All the industries connected with hairdressing suffered in consequence of it. Powder *à la Reine* or *à la Maréchale* was considered aristocratic; it was no longer allowable to rouge. It was perhaps for this reason that Marie-Antoine Caron, *parfumeur*, established since 1778 in the Rue du Four-St. Germain, hated the Revolution with all his heart. Caron, who served as a model for Birotteau, came to Paris from his village with nothing but the clothes he had on. He became, in time, the head of a perfumer's shop in the quarter of the Abbaye. The Revolution ruined his trade, and he became a fanatical royalist. His lost clients were friends and emissaries of the Bourbons. His shop became a centre where letters were exchanged between the Chouans of the west of France and their friends in Paris.

At the time of the eighteenth Brumaire, Caron was fifty-five years old. He had lost his wife in 1787, and was living with two women, his relations, and a man servant; his house had a double entrance. During the bloody days of the Terror, he did not dare to play an active part in politics; after the famous day of the 13th Vendémiaire, when the royalists showed themselves armed in the streets of Paris, he became bolder. His part consisted in receiving in his house and concealing the agents of the Princes, who were sought by the police of the Directory. The first who found a lodging in his house was Pastoret; then came several others, among whom was probably Frotté. "A room was given to the proscribed in the upper part of the house, to which the only access was by a trap-door. The friends who came to see him entered the shop, bargained, in a conventional language, for some perfume, and, while Caron affected to weigh with much attention pastilles of benjamin or oil-of-pearls, the servant watched the street and the visitor took the stairs for the second story." The most constant guest was Hyde de Neuville. A price had been put on his head, but he went quietly, under a false name, from London to Paris and from Paris to Normandy. He spent about eight months in all in Caron's house; he had become quite a friend of the family; he tells in his Memoirs curious anecdotes about the life he led. There were, at the time, public *crieurs* who shouted the news in the streets. One day, while at breakfast, Caron and his family heard a man shouting: "Arrest and condemnation of the conspirator Hyde de Neuville, judged by a military commission and to be shot within twenty-four hours." Hyde de Neuville was at the table, and next to him was another royalist agent, unknown to him, to whom he had been presented as a refractory priest, and who exclaimed: "Oh! it is horrible! What an event, Monsieur l'Abbé! Poor man! he was my friend, my intimate friend!" Hyde de Neuville had much difficulty in not bursting with laughter.

The perfumer Caron was not as brave as Hyde de Neuville, and he finally became so alarmed that he shut the door of the "Queen of Flowers" to the *émigrés*. In March, 1804, a sort of duel took place between the First Consul and the famous Georges Cadoudal, who was hiding in Paris. Georges, who had made an attempt on the life of Bonaparte, and did not conceal his intention of killing him, was concealed at the house of a fruiterer, on the Montagne Sainte-Geneviève, with two of his acolytes. Not feeling safe, he sent one of them to Caron, to ask for a refuge; after some resistance, Caron concluded to trust to Providence, and ordered a mass to be said. "The next day he gave 24 sous to the little Victoire to have one said at the Church of the Carmelites. She addressed herself to an old priest, the Abbé Enard, saying that Caron wished for a mass of the Holy Spirit in order to know God's will on an important decision which he had to take." The mass was celebrated at eleven o'clock. Françoise and Victoire were there, and Caron served it; on coming back he said that "his conscience was calm, and that he would lodge these gentlemen." In the afternoon came a vicar of Saint Sulpice, the Abbé de Kéravenan (who celebrated the marriage of Danton and his mistress and followed the famous Terrorist to the scaffold). This Abbé was probably

the model of the holy priest who appears in 'César Birotteau.' It was arranged that Cadoudal should arrive on the following Friday, in the morning, in a cabriolet, which would be driven by one of his men; his two friends would arrive an hour afterwards. On the day fixed, Caron and the two servants who lived with him were in a state of great excitement. Nobody arrived at the fixed hour; one of the women went out, and saw in the Place Saint-Sulpice a cabriolet, which was empty. She learned there that Georges Cadoudal, being followed by policemen, had jumped out of the cabriolet, had been followed and arrested.

Three days afterward, Caron was arrested. He declared that he did not know the names of the men who had been in his house, and played the part of an imbecile with so much skill that he was released after ten months of imprisonment. His shop had been closed; he received soon afterwards an order to leave Paris and to reside in Bourges, where the police kept an eye on him. He had time before leaving to marry his servant, Françoise, and he confided to her the "Reine des Fleurs." This woman, up to the end of the Empire, wrote petition after petition asking that her husband be allowed to come back to Paris; and protesting that the Emperor could have no more faithful and warm admirer. The police reports did not agree with her language, and Caron remained an exile from Paris till the return of the Bourbons.

His services to the royalist cause had been such that Louis XVIII. allowed him to come before him at the Tuileries and gave him a medal. The Duchess of Angoulême obtained for him the place of King's messenger, and he figured in that capacity in the official lists of the "Royal Almanac" after the dignitaries of the kingdom. He had lodgings in the Palais-Bourbon (now inhabited by the President of the Chamber of Deputies and close to the Palace of the Chamber). His functions were very simple: he accompanied the President of the Chamber from the door of the Palace to the chair; and once a year, in a fine costume, he announced to the House of Peers that the House of Deputies had opened its session.

Caron discharged these functions till he died. He lived to the age of eighty-seven years, and died in 1831. I have just reread 'César Birotteau,' and recognized Caron well in the perfumer who is the central figure in that novel. I admired the great reality and life Balzac gives to his characters. His powerful imagination, his faculty of seeing, so to speak, with the mind's eye, had not a little to do with it; but there is no doubt that Balzac drew much from real life and had living models constantly before him. He combined the traits which were thus furnished to him as a painter combines colors. He lived in a time when there were still many witnesses of the most extraordinary period in French history—men and women who had seen the splendors of the old monarchy, the troubles of the Revolution, the horrors of the Terror, the confusion of the Directory, the epic events of the Empire, the rise and downfall of Napoleon, the return of the Bourbons. This period has furnished ample documents to the historian, and, in one sense, Balzac may almost be called a historian, as he gives us the spirit of the times in which his heroes lived. The curious versatility of his mind allows him to understand the passions of men in all ranks of society. I will not speak here of the real historians of that momentous period. M. Lenotre has chosen in it very special elements; he seems to delight particularly in the study of the unknown and mysterious intrigues which are, so to speak, the subsoil of history. His latest volume, from which I could choose only episodes, adds much to this underground study of the Revolutionary period. I will say, also, that, though it reads sometimes like a novel, it has all the exactitude of real history.

Correspondence.

NOT A NEW CRIME.

To the Editor of The Nation:

Sir: Speaking of what another writer calls "the new negro crime—by which is meant the crime against white women," Mr. I. W. Griscom says, in the *Nation* of July 30 (p. 92):

"We are told by a Southern correspondent in *'Harper's Weekly* of the 18th inst. that this crime was unknown in the days of slavery. This being so, it is clear that it is a result, not of the privilege of voting, but of emancipation. It is the result of the restraints of slavery being removed from a few extremely depraved and brutal human beings."

As the statement that the crime was unknown in the days of slavery is accepted by Mr. Griscom, and as this notion is widely entertained, may I be allowed to point out that the statement is untrue? The crime was known in this country for nearly two hundred years before the abolition of slavery, it was mentioned in legislative acts, and for a century and a half it appears to have been invariably punished by legal process. Hence the only "new" thing about the crime is the illegal and brutal punishment inflicted by white mobs. This is an outgrowth of the past two generations, for apparently not until about 1835 were negroes lynched for this or for any other crime. The earliest instance of the crime known to the present writer occurred in 1676, when a negro was executed at Boston for the rape of his master's daughter. (See 'Records of the Court of Assistants, Mass.,' 1901, p. 74.) Albert Matthews.

Boston, Mass., August 2, 1903.

To the Editor of The Nation:

Sir: I think the Southern correspondent in *Harper's Weekly* (*Nation*, p. 92), is wrong in stating that the particular crime there alluded to was unknown in the days of slavery. There is, in fact, a distinct mention of such a case in Miss Martineau's 'Society in America.' Captain Marryat alludes to the same case. T. T.

A PSEUDONYM.

To the Editor of The Nation:

Sir: Many of your readers will have perused with interest your Paris correspondent's very admirable précis of Lucien Perey's recent volume dealing with the court of Charles of Lorraine at Brussels, reviewed in the *Nation* of July 9, 1903. Some will doubtless notice the slip by which this enchanting historical essay is attributed to a masculine pen. "Lucien Perey" is, as most people on this side know, the nom de plume of Mlle. Luce Herpin, whose studies of the eighteenth century are certainly familiar to those of your readers conversant with the French language.

Very truly yours,

Remsen Whitehouse.

Lausanne, July 20 1903.

Notes.

'Reading a Poem,' a sketch by Thackeray, written in 1841, is to be republished at an early date by A. Wessels Co., with a photogravure portrait, in a limited edition.

'The Nemesis of Froude,' which John Lane promises in another week, will keep the Carlyle controversy boiling a while longer.

'The History of Wethersfield, Conn.,' by Dr. Henry R. Stiles, is announced by the Grafton Press of this city.

A new poetical version of the text of Wagner's "Parsifal," by Oliver Huckel, will be brought out by Thomas Y. Crowell & Co. in anticipation of the opera's first production in this city.

Mr. F. Hopkinson Smith's 'Under Dog,' which we recently appraised, has promptly been reissued as part of the handsome "Beacon Edition" of the works of this versatile writer by Charles Scribner's Sons.

The forced humor of Mr. William Macdonald, who edits with a jaunty preface a twelve-volume edition of the 'Works of Charles Lamb' (London: Dent; New York: Dutton), we are loth to ascribe to being subdued to what he works in. If imitation, it is a poor tribute to the master. We incline to say nothing of it except that the writer compares himself with previous editors, showing how much more he intends to resurrect and rake and scrape together, and how it will be disposed in the series. Most of those who purchase on the faith of his representation will be content to get the most for their money, and let the particulars go. It remains to say that, judging from the first two volumes, 'Essays' and 'Last Essays of Elia,' any possessor of the set is to be congratulated. The Dent stamp of tasteful typography is on them, and Mr. C. E. Brock is in his element in the delightful illustrations. There is a frontispiece portrait from the familiar engraving by Henry Meyer, tinted in the good old fashion, and another, in profile and youthful, from a drawing by Hancock made in 1798.

The 'Biographical Annals of the Civil Government of the United States during its First Century,' compiled by the late Charles Lanman, and published in 1876, had among other valuable features a section of "Tabular Records" displaying the evolution of our Government from the Declaration of Independence to the completion of the Constitutional amendments; and the personnel of the several administrations (President, Vice-President, and Cabinet officers), with particulars as to date of appointment, term of service, origin of the several departments, etc. This useful task has now been performed anew in an independent manner and more fully and explicitly, on the whole, with citation of statutes only referred to by Lanman, and published in a

neat, clearly printed volume by Robert Brent Mosher of the Department of State. Many interesting documents have been introduced from the archives. The division is by Administrations, and that of President Roosevelt concludes the exhibit. The framework is thus laid for a periodical reissue, and the 'Executive Register of the United States' ought to find a place among the convenient and indispensable books of reference.

Mr. A. P. C. Griffin, head of the division of bibliography in the Library of Congress, has put forth a second edition of the 'List of Books (with references to periodicals) on Mercantile Marine Subsidies,' with an author's index; a 'Select List of References on Federal Control of Commerce and Corporations'; another on 'Anglo-Saxon Interests'; a third on 'Industrial Arbitration'; a fourth on 'Labor, Particularly Relating to Strikes,' with a valuable conspectus of the trend of public opinion during the progress of last year's coal strike; a fifth on 'Old-Age and Civil-Service Pensions'; a sixth on 'The Negro Question'; a seventh of books on the 'Constitution of the United States'; and an eighth on the 'Cabinets of England and America,' in which Mr. Gamaliel Bradford's gallant forlorn hope for the seating of Cabinet officers in Congress is not overlooked.

The eighth volume of the second series of the Index Catalogue of the Library of the Surgeon-General's Office, U. S. A., embraces the latter half of I and the whole of J and K, and is substantially alongside Volume VII. of the original series. Insanity claims 175 pages, the Intestines 106, the Kidneys 90; and Jaundice, Jaws, Joints, Knee, and even Jurisprudence (18 pages) make a formidable array. Insects demand 11 pages, and more than a tenth part of this space is given to patent specifications for insecticides. The mosquito does not figure here explicitly, nor under Kerosene. The Kneipp cure occupies a column and a half. Two editions of King James's 'Counterblast to Tobacco,' 1843, 1880, have been taken into the vast collection; and another monarch, Ivan the Terrible, has his mental condition studied in "psychiatric sketches from history," by a Russian author, Kovalevsky. Additions to medical incunabula are comparatively rare in this volume. The numerous works and editions of J. H. Jüngken lead off with one of 1684; of Joannes Ketam there are editions of 1500, 1509, the former with nine woodcuts. The rigid application of the cataloguer's rule to enter an anonymous work by the first significant word of the title, is here exemplified—not to the searcher's advantage, in our opinion—in Jeffries Wyman, John Call Dalton, John P. Phair, for Wyman, J., etc.

The showy Year Book of the Holland Society of New York for 1903 would scarcely merit so much outlay if its middle contents alone were considered—the dinner speeches of the year. The substantial portions for preservation and reference are, at the beginning, the transcripts, with index, of "Some Early Records of the Lutheran Church, New York," and, at the end, the obituaries of deceased members. Scattered through the volume are portraits of officers and speakers.

The third number of the Boston Museum of Fine Arts Bulletin constitutes a guide to the Museum, with a better than dry introduction to the several rooms and their principal contents, and a plan of each floor.

The statement of business to June 30, 1903, by Thorvald Solberg, Register of Copyrights, shows the largest amount in the history of the office, whether fees or items of entry and deposit be considered. The fees for the year ending as above reached nearly $69,000, a gain of more than four thousand. As many as 3,427 titles were registered on the heaviest day.

We have received from Effingham Wilson, Royal Exchange, London, a relief school wall-map of the world, combining the physical features with political outlines. This is the first of a series to be produced from actual relief models, printed in a low tint of sepia and hence very clear. The general appearance, too, is agreeable, and we can commend these maps for hanging where they will silently instruct the eye in geography.

A conference of leading colonial and British educators was held in London last month "to consider the coördination of university education throughout the Empire, the development of post-graduate courses in applied science, and the formation of an imperial council to deal permanently with these and other matters of special interest to university students." Mr. Bryce presided at the first session, making a most interesting and suggestive address. Referring to the fact that "wherever Britons had gone it had been a part of the British policy to establish universities," he said that "they now wished to correlate these seats of learning and to combine their efforts, . . . to increase their efficiency, partly by combination, and partly, where there was room for that process, by specialization also." These ends would be reached best through an interchange of students, towards which a very remarkable step had been taken by the magnificent endowment of Mr. Cecil Rhodes. This interchange would "help them, as perhaps nothing else would do, to follow the movements of public opinion in those regions, and to create what he might call a common public opinion of the British people—a public opinion which would occupy itself with questions which were common to all." Sir William Huggins expressed the high appreciation and sympathy of the Royal Society with the great objects of the conference, and Lord Kelvin welcomed it as an important step towards the unification of the Empire. Sir Oliver Lodge advocated coöperation, "not by uniformity but rather the opposite—each trying educational experiments in the training of teachers, methods of examination and so on, comparing results fully and freely, and then adopting the methods which were found to be the best."

An important step in the progress of Japan is apparently about to be taken in the compulsory teaching of the Roman alphabet, as well as a Romanized Japanese alphabet, in the Government primary schools. This work has been done to some extent already in the universities, but, if this proposal of the Education Department be adopted, the Romanization of the Japanese language is not far distant, for the next generation of Japanese of all classes will be familiar with the Latin alphabet. It is difficult to realize all that this will mean to the nation. It will simplify political and commercial relations, and will render Western thought and literature accessible to the bulk of the people. The scheme, if it find favor, will probably come into operation at the beginning of the next scholastic year, leaving a few months for the preparation of the readers and other handbooks.

—The August *Scribner's* is devoted as usual to fiction. The story of the great sea fight off Ushant, in 1794, is hardly an exception when one considers the form in which it is written, and the same might perhaps be said of Nelson Lloyd's article on "The County Fair," without depriving sociology of any highly valuable asset. In the selection of stories the editors have secured a goodly number of very distinctly marked types—the serious moral problem of Edith Wharton's "Sanctuary," the delicious satire of "The Burglar and the Lady," by Jesse Lynch Williams; the admirable fooling of Margaret Sherwood in "The Princess and the Microbe"; Anne O'Hagan's almost comical pathos in "Miss Martin's Hour," and the breezy love story by Mary R. S. Andrews, "The Little Revenge." In the field of art, Montgomery Schuyler considers the problem of the modern skyscraper. Of present achievements he speaks with deserved severity. "These things have turned the sky-line of New York into a horribly jagged Sierra, and converted the commercial quarters of all our chief commercial cities into gloomy and windy cañons." With intelligent legislative regulation, however, and intelligent effort on the part of architects, he sees the possibility of something better. "We can imagine quarters and avenues in New York in which a uniform bounding row of skyscrapers might be not merely inoffensive, but sublime. The editor makes our new relations with the Orient the occasion for a plea for more attention to "manners" according to the Emersonian definition—"the happy ways of doing things, hardened into usage."

—*Harper's* for August gives a liberal allowance to the fiction reader, but without exclusion of other interests. Brander Matthews writes of "Foreign Words in English Speech," pleading especially for the Anglicising of plurals brought in from other tongues. In alleging vainglorious freakishness, cheap effrontery, literary snobbishness, etc., against those who employ such plurals as *criteria*, *indices*, and *foci*, Professor Matthews strays wide of the fact. He seems to proceed on the theory that we borrow these words exclusively in the singular, and then pluralize them, either pedantically with the foreign termination, or naturally with the English. He is at one here with his colleague of the *Bookman*, whose chronic war against what he is pleased to call "the retained object" assumes that we think first in the *active* voice and then turn a mental somersault into the passive, thoughtlessly "retaining" in the new position an object to which we are not entitled. As a matter of fact, men think as spontaneously in the passive as in the active, in the plural as in the singular. While the nouns that are troubling Professor Matthews were still recognized as distinctly foreign, they were borrowed and used in the plural as well as the singular, and with some of them the plural form is distinctly the more familiar, as in the case of *alumni*, *bacteria*, *data*. If there is any room for an affected display of knowledge in the case of many of these words, it is in the use not of the universally familiar foreign form of the plural ending, but of the almost entirely unknown

English form. We venture that not many *alumnuses* of Columbia have ever heard the words *thesises* or *bacteriums*, even in their association with Professor Matthews. If it be pedantry to avoid such disagreeable forms and go on using that with which common usage has rendered us familiar, then by all means let us be pedantic.

—The *Atlantic* presents a gloomy picture of the Philippines in a letter from Arthur Stanley Riggs. There is practically no loyalty to the American cause anywhere; the north is suffering from a vigorous insurrection, while famine, cholera, ladronism, and the intractable Moro trouble the south. Commerce is dull, business houses are everywhere retrenching, and dissatisfaction is evident on every hand. In Mr. Riggs's opinion, the appearance of a really magnetic leader would bring us face to face with another general insurrection; and the temper of the American army is such, he thinks, that the Filipino forces would be "wiped out of existence in smoke and blood" with or without the consent of our officers. Mr. Riggs seems unable to rise to the conception of any other possible palliative than less sentiment and more force, and hence his letter is not significant except as another among the numerous evidences of the failure of the Imperialist programme down to the present date. Prof. Charles J. Bullock presents some striking facts as to the consolidation of banking interests in the United States during the past five years, showing that the Standard Oil and the Morgan alliances together control nearly half the capital invested in banking in the city of New York. He regards this concentration as capable of doing great good by steadying the market in times of possible panic, but only if more than ordinary conservatism be displayed in the management of such enormous power. He sees much potential evil, however, in a situation which ties up so large a proportion of available banking capital in close association with a few great corporate interests, and throws almost insuperable obstacles in the way of financing any new enterprise of great magnitude against the wishes of these interests. Louis C. Elson pleads for a revolution in our ideas of public education in music. Attention should also be given, he thinks, to the receptive rather than the constructive side, that unfortunates "who now howl dutifully twice a week" may be enabled really to enjoy music which they are not obliged to assist in making.

—The progress of the Oxford English Dictionary, under its now triple editorship, is like the line of wave upon the beach. Most in arrear is Mr. Bradley, with "L—Lap," "Lap—Leisurely" sections not yet attaining M; Dr. Murray, a little further up the strand, is on the confines of P; while Mr W. A. Craigie makes the highest reach before recession—"R—Reactive"—in the instalment just issued by the Clarendon Press (New York: H. Frowde). We are with him in volume viii., with Dr. Murray in volume vii., with Mr. Bradley in volume vi. Two more, we are assured, and the mighty work will be rounded out, the tenth volume containing T—Z, "together with some additional matter." It falls to Mr. Craigie to discuss the origin and functions of the letter R. Its vowel relations are the most striking. "By southern [England] speakers *r* is frequently introduced in hiatus, especially in the phrase *the idea(r) of;* in vulgar speech it is heard even in such forms as *draw(r)ing*. In all periods of English *r* has exercised a marked effect upon a preceding vowel." "The R months," during which oysters are in season, find recognition as early as 1599. The phrase "The three R's" "is said to have originated with Sir W. Curtis (1752-1829), who proposed it as a toast"; the first occurrence of it in print, "Reading, Writing, and Rithmetic" bears date 1828. In 1879 the *Athenæum* ventured "Romanism, Ritualism, and Rationalism, the three 'r's' of theological controversy"; and some American colaborer might have supplied the Dictionary with Burchard's untimely "Rum, Romanism, and Rebellion." Another Americanism we miss under Racks, the technical name for the side plankings or buffers of our ferry slips. Railroad was used by Smeaton in 1775, one year in advance of the first recorded use of Railway; and our preferred designation was, we are told, "at one time equally (or more) common in Great Britain, and [is] still usual in America." On the whole, it seems more available for derivatives than Railway—*e. g.*, Railroadiana, Railroadish, Railroadship, Railroader, Railroading, as against Railwayize, Railwayless. Chiefly in the United States may one hear the expression, to "raise" a child; but Mr. Craigie cites an English instance of 1744.

—It is curious that the two earliest examples of Rabblement (=Rabble), in 1548-9, are associated with translations of Erasmus. Raid was revived by Scott, along with Ransom. The ultimate origin of Rat is obscure, "but it seems probable that it was adopted first in the Teutonic languages when the animal came to be known in western Europe, and thence passed into the Romance tongues." Razzia, a French taking over from Algerian Arabic, and pronounced as if it rhymed with *has he a*, is in some recent dictionaries pronounced *ratsia*, "on the analogy of Italian words of similar form," probably from a mistaken etymology. Raillery, pronounced with long *a* in the first syllable, is a slightly younger form than Rallery, "a form which represents the older pronunciation given by Sheridan, Walker, Smart, etc., and still used by some (especially U. S.) speakers." Mr. Craig, coming to the prefix *re-*, gives a full display of its varied force in Latin compounds, and then shows how in English formations it is almost exclusively restricted to the sense of "again," but with such an infinite extension in compounding that no dictionary could cope with the vocabulary. This imposes upon the editor who is obliged to select, a hard task indeed. *Re-* may be prefixed to any English verb or verbal derivative; and "in all words of this type the prefix is pronounced with a clear *e*, and frequently with a certain degree of stress, whereas in words of Latin or Romanic origin the vowel is usually obscured or shortened. . . . In this way double forms arise, with difference of meaning, which in writing are usually distinguished by hyphening the prefix, as recoil, and re-coil . . .," as also happens "when emphasis is laid on the idea of repetition, as, bind and re-bind, or when the main element begins with a vowel." If that vowel be *e*, the hyphen is more apt to be used than the diæresis.

—It is doubtful whether any new edition of Arber's 'English Garner' could retain the charm of the volumes as originally issued between 1877 and 1890. In them Professor Arber brought together many of the most entertaining specimens of sixteenth and seventeenth-century English writing in such a way as to reproduce much of the spirit and the literary ideals of the years when modern England was coming into being. An edition in which the contents are to be rearranged for the sake of making them more practically useful will inevitably lose the very qualities which made those volumes a source of delight and of education to all who had occasion to look through their mazes. Professor Arber had many faults as an editor, and these the publishers of the new edition (London: A. Constable & Co.; New York: E. P. Dutton & Co.) carefully preserve. They seem to think that their whole duty to the man who made the 'Garner' is done when, in a note on the back of the title-page (the only place where they mention Professor Arber's name), they refer to his preëminent virtue—that of accurate collation of texts. Judged by present-day standards of literary and historical editing, his faults are aggravating enough. Much may be said in favor of his modernized spelling, for he wished the general run of book-buyers to read these volumes. More serious matters are the insertion of particles to complete, and occasionally to destroy, the already sufficiently obvious sense; the use of a sort of yard-stick method for determining the modern equivalents for money-values, than which nothing is more uncertain; and his frequent blunders in facts and opinions, such as adding "Indian" as a synonym for "Blackamore." The editors of the new edition are apparently not to touch any of these things. But, with all its faults, Arber's 'Garner' possessed very unusual value, because he edited it precisely as if he were living and publishing in the sixteenth century. He had become so permeated with the feeling of that age that he treated its literary productions precisely as Eden or Hakluyt or Purchas might have done. His faults, like his method and his material, were those of three hundred years ago. As a consequence, the reader who ranges through his volumes finds therein the spirit and the character, the fascination of sixteenth-century England. The new edition of the 'Garner' will be infinitely more convenient if one is looking for information on any particular subject. The first two volumes, for example, contain all the narratives of "Voyages and Travels." These are edited by Raymond Beazley of Oxford, who has prefaced them with learned and scholarly introductions, very readable as well, supplying information necessary to an understanding of the various narratives. This is most desirable, but it cannot supply the more important understanding of the age as a whole, of what it is that gives to these expressions of the thought and action of that most virile age their undeniable charm. No one ever turned the pages of the old 'Garner' without acquiring a fresh and lively appreciation of what the English folk were like three hundred years ago. In comparison, the new edition seems almost as lifeless as a history for ready reference.

—In the death of Alfred Q. Collins, Amer-

ica has lost an artist who deserved a much wider reputation than he had attained. He was born in New England in 1855, and studied under Bonnat in Paris, returning to this country in 1883, and settling in New York in 1887, where he devoted himself to portrait painting. A fine specimen of his work, his portrait of Justice Van Brunt, may be seen in the Appellate Court room on Madison Square. His painting had few showy qualities, but his brother artists knew how to appreciate his firm drawing, solid workmanship, and powerful characterization; and though he seldom cared to exhibit and was little before the public, his professional standing was of the highest. His art was always perfectly straightforward and sincere, and the vitality of his likenesses was astonishing. At his best the material seemed to disappear and one was confronted with the living man. It is greatly to be hoped that a sufficient number of his works may be got together for exhibition, next winter, to give a clear idea of his extraordinary abilities.

BERENSON'S FLORENTINE DRAWINGS.

The Drawings of the Florentine Painters, Classified, Criticised, and Studied as Documents in the History and Appreciation of Tuscan Art. With a Copious *Catalogue Raisonné*. By Bernhard Berenson. E. P. Dutton & Co. 1903.

Mr. Berenson's latest work, on which he has been engaged for many years, is truly, and in every way, monumental. The mere physical presence of the two great folio volumes is overwhelming. The page is about eighteen inches high by fourteen and a half inches wide, and the volumes are each about two and a half inches thick. The first volume contains more than three hundred pages of critical text, while the second is devoted to the Catalogue, which contains more than 2,800 numbers, the entries running from a line to a page of description and comment. Scattered through the two volumes are 180 plates of drawings "selected as specimens of Florentine draughtsmanship," and reproduced in facsimile by the best modern processes. In all but one or two cases these plates are the exact size of the original, and in almost every case they are so exact in color and the rendering of touch and method that they are, for purposes of study or pleasure, almost equal to the originals. To have done at once with this aspect of the book, let us add that the paper and printing are of the handsomest, and the text, considering the amount of it and its difficulties, remarkably correct, and that the binding, in khaki and brown morocco, is sober and substantial. As the edition is limited to 355 copies (of which 105 are for America) and the type has been distributed, the appeal to the bibliophile should be irresistible.

For the artist and art lover, the superb plates will be the great attraction; for the serious student the text and Catalogue are the important thing. Whatever opinion one may hold of Mr. Berenson's results, there can be but one as to his seriousness and industry, and it is worth while, at the outset, to try to form some idea of the prodigious amount of labor which the preparation of these volumes must have entailed. In the first place, the 2,800 numbers in the Catalogue give no just idea of the number of drawings actually examined. Some of the numbers include many separate sheets, such as No. 561, Botticelli's illustrations to Dante, in Berlin, or No. 1046, Leonardo's Codex Atlanticus in the Ambrosiana, and No. 1071, the same artist's manuscripts in the Institute of France, which have been published in six volumes. Many single sheets, including most of Michelangelo's, are drawn on both sides, and many more have several drawings on the one side, not always by the same hand. Besides all these, must have been seen, and studied more or less, many drawings which are not, for one reason or another, catalogued at all. For instance, the drawings of Leonardo's Milanese following, not being Florentine, are not catalogued, yet they must have been studied to avoid cataloguing them as Leonardo's own. It would be difficult to estimate how many separate drawings Mr. Berenson must have studied in the preparation of his book, but the number can hardly have been less than two or three times as great as that of the entries in his Catalogue.

This vast mass of drawings is scattered through the museums and libraries of Europe and many private collections; the greater part of it was uncatalogued or very insufficiently catalogued; only a part has ever been photographed; and the attribution to this or that master is often absurd, and oftener doubtful. All these drawings have had to be minutely studied and compared with each other and with the pictures with which they might be connected, and every artistic mannerism in the representation of nature or the use of material has been noted and looked for in other works, until the whole mass could be assorted into various groups representing so many "artistic personalities." Many such personalities could be at once connected with an historic name, but others could not; in such cases Mr. Berenson, feeling sure that the personality really existed, has not hesitated to invent a name that may answer as a convenient designation until, if ever, the name borne by the artist "in the flesh" shall be discovered. Finally, whatever documentary evidence has been discovered by the researches of the "archivists" had to be considered and reconciled with the internal evidence. In all this work Mr. Berenson has accepted nothing on trust, and admitted no authority, however respected, but has retested every attribution and reweighed every bit of evidence, and has not hesitated to announce any conclusion, however startling or revolutionary. The whole list has then been numbered consecutively, so that in future any sheet can be briefly identified by such a reference as "Berenson, Florentine Drawings, No. 758."

So far all this labor is strictly that of the cataloguer, but Mr. Berenson has not been content to be merely a cataloguer. All these drawings he has studied again—first, as a critic, for their own æsthetic value and the light they throw on the aims and qualities of Florentine art; second, as a psychologist, for their revelations (more intimate than those of completed work) of temperament and personality; third, in the case of the greater men, as an historian, for their record of the origin and evolution of this or that world-renowned masterpiece.

It is evident that half-a-dozen review articles would not suffice for the mere statement of Mr. Berenson's conclusions. Their discussion and proper criticism would require almost as much labor as Mr. Berenson's own, even if the critic had already something of that writer's expert knowledge. Even the 180 plates would not greatly simplify matters, for, as Mr. Berenson justly remarks, "ten times that number would scarcely suffice to illustrate the text." The true criticism of his book will occupy many years, and will be the work of many hands. At first those who cannot distinguish between conjecture and fact are likely to accept him wholesale; and there are to-day, perhaps, as many of these as of those who will sneer at all connoisseurship and "attribution-mongering," and refuse to consider him at all. Gradually, little by little, the whole of his work will be gone over, with here a rectification, and there an opposing argument or a confirmation, until there is something like a consensus of opinion and a definitive list. We, who have always inclined to a certain caution and natural scepticism in accepting the results of modern connoisseurship, may at least agree that the work of classifying the drawings of the old masters is necessary to be done; that no one is better fitted to inaugurate it than Mr. Berenson; and that the present book will prove the indispensable foundation upon which all future laborers must build. For the rest, we can but touch it here and there at such points as our interest and knowledge dictate.

One of the most startling of Mr. Berenson's achievements, the invention (in the old or new sense) of "Amico di Sandro," was a part of the work undertaken in preparation for these volumes, and the account of the paintings collected under that name was finally published separately because it had grown too long for the place it was meant to occupy. The drawings which Mr. Berenson believes to have been done by the same hand remained for discussion here, together with the work of one or two other like hypothetical personalities, such as "Alunno di Domenico" and "Andrea di Michelangelo." The latter seems certainly to have existed, and to have been named Andrea, whatever may have been his other name, and whether or not he made the drawings attributed to him. In an "addition" Mr. Berenson announces that the real name of "Alunno di Domenico" has been discovered, and that it is Bartolommeo di Giovanni. What may be accomplished by connoisseurship is shown by the fact that the date given by Mr. Berenson, purely on evidences of style, to Botticelli's "Fortezza" has since been proved by documentary evidence to be exact.

Mr. Berenson's own confidence in internal evidence is best shown in the case of the two Raffaellinos. It seems that the works of Raffaellino del Garbo and of Raffaellino di Carli have been confused by Vasari and every one else; also, that the family name of Raffaellino del Garbo was Capponi. Nevertheless, Mr. Berenson unhesitatingly ascribes the one picture signed Capponi to Carli, affirming that "Carli must have painted this altar-piece for Garbo, who had it inscribed with his own name." This is certainly possible; whether or not it is true must be decided by those who have the competence and the facility for an exhaustive study of all the works in ques-

tion. The whole problem of Garbo and Carli and "Alunno" seems to us to have rather the interest of a fascinating puzzle than any real importance. To the non-expert it seems that the three drawings published by Berenson under the name of Garbo are amazingly unlike each other in style, and that the head and drapery of the best of them, a study for the Resurrected Christ, in the British Museum, show precisely that Peruginesque influence which should, according to the hypothesis, characterize Carli.

The attempts to reconstruct the artistic personalities of second and third-rate artists become of real importance when these artists are of the following of a great master and when their work has been confused with his. It is something to say that this or that drawing is *not* by Botticelli or Michelangelo, but if one can say that it *is* by "Amico" or Raffaelle da Montelupo or another, it clinches the matter. One of Mr. Berenson's most important and interesting chapters, therefore, is Chapter X., which, with parts of Chapter IX., is devoted to the followers and imitators of Michelangelo; and here we can go almost all the way with him. The one plate attributed to "Andrea di Michelangelo" supplies, indeed, insufficient data for the examination of his claims to the authorship of the drawings attributed to him, but enough are published of the famous drawings now taken from Michelango and bestowed upon Sebastiano del Piombo to convince us that Mr. Berenson is probably right. The change of ownership enriches Sebastiano without impoverishing Michelangelo, and leaves both artists more clearly outlined. One is inclined to regret some of the drawings now given to Bandinelli; but something was always wrong with them, and, as they are assumed to be copies after lost originals, their present attribution takes little from the great man and adds nothing to the base one. The identification of a number of Michelangelesque drawings, in most of which the shading is done with strokes from left to right, as by the historically left-handed Raffaelle da Montelupo, seems to us one of Mr. Berenson's most brilliant and convincing achievements. Among these drawings is the so-called "Study for the Madonna in the Sacristy of San Lorenzo," which we ventured, many years ago, in our review of Symonds's 'Michelangelo,' to call a copy after the statue by an unknown hand.

In the case of certain architectural sketches, hitherto attributed to Michelangelo, Mr. Berenson has not insisted upon furnishing another artistic personality to father them, but has contented himself with the conjecture that they are by some follower of Aristotele da San Gallo, and that they are later fantasias on or attempted restorations of the earlier designs for the tomb of Julius rather than the original designs. His discussion of them and of the various stages of this tomb as well as of the Medici tombs is able and, we are inclined to think, conclusive. If it does not leave us with a much clearer conception of Michelangelo's intentions, it at least acquits him of some very bad taste. We could wish, however, that Mr. Berenson had been less openly scornful of the incompetence of others who have been misled by the traditional attribution.

In the manner of arriving at such conclusions as these we have noted—in the application of the methods of connoisseurship to the drawings under discussion—while the eye and the ear, the folds and the fingernails, still receive, as they must, a good deal of attention, we seem to see a growing tendency to rely upon "quality" as the final test of the work of the greater masters. A given drawing, attributed to, say, Leonardo, may have his forms, his types, his left-handed pen-stroke, but if it is not in itself a beautiful thing, Mr. Berenson "cannot so far abandon his sense of quality" as to accept it. Now the sense of quality may be cultivated but cannot be reasoned about—its exercise is a matter of artistic sensitiveness, not of scientific accuracy. Mr. Berenson has always believed in the necessity of such a sense, and the change may be more in the subjects dealt with than in him, but the result is a welcome humanization of studies which tend to aridity.

A somewhat similar change seems to be taking place in the manner of his æsthetic criticism. This has always been acute, but its effect has been marred by a certain harshness of style and a somewhat repellant, if scientific, vocabulary. In the present work that vocabulary has undergone some modification, and, though the thing meant is discussed many times, we have not once found the words "tactile values." He has evidently tried to put his ideas into the common literary language that the world understands, and in so doing has gone far to recommend them. At his best his criticism has become not only illuminating but inspiriting.

His love of spontaneity and swiftness of touch seems to us to lead to too great an admiration for mere sketching, and to a tendency to underrate the more finished drawings of the masters. Pollajuolo's "Hercules," which he praises highly, seems to us to approach dangerously near to penmanship; and his selection from Andrea del Sarto's drawings does not seem to us the best possible, the line being often more instantaneous than certain. Indeed, one or two of them are so formless, here and there, as to give the impression that some idle scribbler has attempted to carry out the parts which Andrea had omitted. On the other hand, Mr. Berenson seems fully to appreciate the exceeding beauty of some of Michelangelo's more finished drawings, such as "The Archers" at Windsor and "The Resurrection" in the British Museum—not to mention the wonderful head at Oxford (Pl. cxxx.), in which utmost delicacy of modelling is combined with utmost freedom and rapidity of handling; and he is quite right in finding a certain tameness in the show drawings made for Cavalieri. The analysis of the artistic aims and methods of Michelangelo is, indeed, almost wholly admirable, and the discussion of Leonardo as a draughtsman is scarcely less so.

In connection with this latter artist's more fluent sketches, as in discussing the work of Botticelli and the whole school of "linealists," Mr. Berenson has frequent occasion to refer to the finer qualities of Japanese art. In the days when we are all being sent to school to the Japanese, it is well to be reminded that these qualities have always existed in the art of Europe, but in combination with so many other qualities, unknown to the Orient, that they have been neglected. In swift flow and elegance of line, in pattern, and even in quality of color, Botticelli's "Primavera" is amazingly like a fine Japanese print, while the Far East has produced no greater marvels of pure handicraft than some of these Italian drawings.

Finally, Mr. Berenson gives an interesting analysis of the peculiar charm of the earlier decadents, such as Pontormo. We should like to take issue with him on what seems to us his somewhat extravagant valuation of that artist's sketch for a pierced lunette (Pl. clxx.), but our review is already long enough. If we have given any notion of the quantity and variety of more or less contentious matter which his book contains, we shall have fulfilled our purpose. Mr. Berenson is the only connoisseur who has general ideas, and the only critic who has the equipment of an expert. Our own bias leads us to prefer the critic in him to the connoisseur, but doubtless the one is necessary to the other. When, as the signs seem to show he will, he has learned to subordinate the connoisseur to the critic, if he can add to both a little more of the artist in letters he should become a distinct force in criticism.

BRET HARTE, AND SUNDRY NOVELS.

The Life of Bret Harte. By F. Edgar Pemberton. Dodd, Mead & Co.

Trent's Trust, and Other Stories. By Bret Harte. Boston: Houghton, Mifflin & Co.

Gordon Keith. By Thomas Nelson Page. Charles Scribner's Sons.

A Gentleman of the South. By William Garrott Brown. The Macmillan Co.

Ethel. By J. J. Bell. Harper & Bros.

To write the life of a famous man who has also been a personal friend, is such a difficult and delicate undertaking that it implies the possession of courage pushed to rashness. If the biographer strives to make an impartial portrait of the man and a critical estimate of the work that has won fame, he runs the risk of appearing to the public, if not in the light of an actual enemy, at best in that of a false friend; if he limits himself to an expression of warm admiration, nobody accepts his characterization of the man, and his estimate of the work has very little critical value.

Mr. Pemberton's attitude towards Bret Harte is frankly that of an enthusiastic, almost adoring friend. "It is easier," he says, "to begin than to finish a book in which each line is written under the consciousness of a personal sorrow." Whether this reflection be true or not, one wishes that he had resisted the temptation to begin so soon, because he seems to have been intimate with Harte, and, had he taken time to think, might have convinced some people that the subject of his eulogy was irreproachable in all the relations of life, a modest, courteous, unselfish gentleman and a slave to duty. Moreover, he would thus have avoided the suspicion of rushing into print animated chiefly by calculation of the commercial advantage of being first in the field. A note on the bibliography, which he says had Harte's approval, indicates Mr. Pemberton's disinclination to waste any time in preliminary preparations for writing a book. "I regret," he says, "that I am unable to give the name of American publishers."

Although his book is rather a ponderous one, he has also been unable to include any important facts that are not already matters of common knowledge. Some letters written to Mrs. Harte in the first years of her husband's life in foreign countries are interesting because they show a receptivity to new impressions noticeably absent in the fiction written after he had bidden America good-bye. For Germany he had little liking, and for German music a distaste so pronounced that it stirred him to vigorous and amusing denunciation. Plainly, from the beginning, he was captivated by England and by those English people with great names who welcomed him in their homes. From Froude's place in Devonshire he writes: "Imagine, if you can, something between 'Locksley Hall' and the 'high Hall garden' where Maud used to walk." And again, from a fine country-house: "I scarcely believe I am not reading an English novel or that I am not myself a wandering ghost." For a long time in the Old World he had a vivid sense of the unreality of landscape, city streets and buildings, feeling that he was moving among conventional stage settings which might be shifted at any moment. Since he never returned to America, it is hard to believe that his expressed preference for this country, frequently reported by Mr. Pemberton, was a genuine sentiment. His biographer, however, assumes that he positively pined for his native land, but was detained in foreign places by an extraordinary attachment to duty. By way of illustrating Harte's capacity for renunciation of selfish pleasure Mr. Pemberton writes solemnly:

"While London attracted him, the Consul felt bound to put in many appearances in Glasgow, and he spent much of his time in travelling over the long distance that separates the two great cities."

To construe such casual recognition of official requirement as devotion is indeed to take an airy view of consular duty.

All the comment there is on Harte's literary work eulogizes without discrimination. His later stories are declared to be often, if not always, as good as his earlier; and every page proclaims the undimmed genius of Mr. Pemberton's "fascinating, affectionate, lovable comrade." The only display of ill-feeling in the book is against those "good people who, while professing to admire Bret Harte, never tire of saying that he produced nothing but stories about California and gold-seekers." The responsibility for this statement can most charitably be laid upon Mr. Pemberton's hasty method of composition. He probably meant to say that many good people wish that Bret Harte had produced nothing but stories about California and gold-seekers, and contend that his later writings, whatever their subject, are not first-rate, not even remarkable. To assert that the poorest of Harte's work is better than the mass of current fiction is an unconscious concession to the good people who argue that it showed tremendous inequality. It would be sad indeed if a man of genius and great literary facility had ever fallen so low as to justify the institution of such comparison.

The latest and presumably final collection of his stories, entitled 'Trent's Trust,' is as indisputably superior to the common run of fiction as it is inferior to the author's highest standard. The title story has that faulty construction which is evident in all his efforts to pass the limits of a short story. Through a bewildering series of romantic accidents and extraordinary coincidences, the author pursues the rightful heir to estates voluntarily abandoned by an eccentric Englishman. The reader who, by independent effort, manages to keep up with the chase, may find reward in the proud recognition of his own uncommon intelligence. The shorter stories are more readable. Colonel Starbottle and Jack Hamlin reappear not ingloriously, and the top-heavy stage-coach whirls along through clouds of dust, with a driver calm and faithful as Yuba Bill. The tale entitled "Prosper's Old Mother" is unequivocally good. It has a touch of the author's youthful vividness and assurance, rarely lapsing into the vagueness of a reminiscence or feebleness of a réchauffé.

When Mr. Page began to write stories, he probably had no deliberate intention of becoming a social historian of the South; nevertheless, to-day a vivid and apparently truthful conception of Southern society—of the ruin of the old order and rise of the new—may be formed by reading his books in the order of their production. His early tales collectively stand as an idyll of the old South, enshrining the romantic aspects of its prosperity and the tragedy of its disruption. 'Red Rock' delineates the unhappy struggle for adjustment to new conditions which marked the period of Reconstruction, and 'Gordon Keith' heralds the dawn of an era of commercial and industrial development. This latest novel may be properly described as Mr. Page's most serious effort, but unfortunately (as often happens in the writing of fiction) a consciousness of important intention has choked the springs of inspiration and throttled the valves of spontaneous creation. At all events, we have no other way of accounting for the heaviness, the dulness, the lack of sustained interest of a book which has a broad and significant motive, a variety of contrasting characters, and an extraordinary number of exciting incidents.

Mr. Page's account of Keith from boyhood to middle age is tediously circumstantial, showing no sense of artistic selection, and with hardly a gleam of vivacity or a moment of strong, stirring emotion. Keith is never just a man, but always a hero—in defeat or victory always right. Ferdy Wickersham, with whom Keith comes constantly in contact and conflict, has, on the other hand, a quite unnatural talent for being always wrong. A bad son, a bad friend, a beguiler and betrayer of women, he might point an impressive moral were it not that he is just too bad to believe in at all. Most of the people in the book (and there are a great many) are like the two principal figures, too immaculate or too depraved. The clergyman, Mr. Rimmon, is a survival of eighteenth-century English fiction. We have met him in the pages of Fielding and Smollett, and learn with some surprise and horror that he is now actually a shepherd of aristocratic souls in the city of New York, and made welcome to a cup of tea any afternoon in houses of the highest fashion. Miss Lois Huntington, Keith's true love, to whom he returns after a period of worship of false goddesses, has all the virtues of the old-fashioned *ingénue*, combined with the priggishness of a modern superior girl. A foreigner confronted with the spectacle of Lois pointing the path of propriety to a somewhat skittish married friend, would give up in despair any faint hope he might hitherto have cherished of understanding the rights, privileges, and duties of the young girl in America. Mrs. Lancaster, for many years Keith's star of hope and oriflamme in the battle of life, is a much more natural figure than Lois, and shares with Squire Rawson the honors for individuality and forcible representation. The incidents through which Keith, his friends, and enemies pass to ultimate destiny are sometimes thrilling to a degree, sometimes so capricious, sometimes so hackneyed, that the reader's final impression is of having assisted at a high-flown, conventional melodrama. It is unfortunate that this impression is the strongest and most lasting derivable from a book to the writing of which thought and knowledge and patience have been given without stint.

Among the many surviving traditions of the old South none has more vitality than that the masters, the lords of great estates and many slaves, were gentlemen of a perfection rarely if ever attained in any other clime, at any other period of the world's history. Mr. Page makes his compliments to this tradition in the person of Gen. Keith, his hero's father, but his song of salutation is feeble in comparison with the fanfare of Mr. William Garrott Brown's trumpet. His story, entitled 'A Gentleman of the South,' puts all former representations of this American dodo to shame. In comparison with Henry Selden, Sir Charles Grandison is only gentlemanly. Nothing more need be said about Mr. Selden's character, and of the incidents in which he has a part, only that they are well chosen to exhibit it.

The quickly won vogue of 'Wee Macgreegor' probably impelled the author to tempt fortune in hot haste with another book. Like its predecessor, 'Ethel' is a series of dialogues, not, however, written in Glasgow dialect. Only two persons appear, Ethel and another, whom one should describe as her *fiancé*, or lover, but is driven by a sense of the greater fitness to call her young man. Mr. Bell contrives to characterize Ethel and her young man through their talk quite as clearly as he did the Robinson family, but the personalities revealed are far less engaging. They are very ordinary youngsters, perpetually chaffing each other, addicted to bad puns, and showing neither depth of sentiment nor brilliancy of intellect. Mr. Hope's 'Dolly Dialogues' may have inspired this work, which hardly deserves the measure of praise due to a good copy of a clever original.

ENGLISH VERSE.

English Verse. By Raymond Macdonald Alden. Henry Holt & Co.

A Study of Metre. By T. S. Omond. London: Grant Richards.

That the study of English versification is being prosecuted along promising and rational lines, likely to lead eventually to a satisfactory and comprehensive theory, seems indicated by the nearly simultaneous appearance of two books very different in other respects, but similar in being sensible, clear, and moderate in tone. Professor Alden's is made up largely of quoted ex-

amples from the poets. Its avowed aim is, by giving sufficient material in one voluume, to do away with the necessity for consulting a great variety of books in the inductive study of English verse. No scholar could possibly construct such a compilation to satisfy every one. Mr. Alden appears to have come as near to it as may be, for this anthology of illustrative excerpts seems judiciously made. If it err, it is chiefly in giving too much space to citations from the poets antedating Tottel's Miscellany; and in the chapter on artificial imitations of French forms the author seems less at home with his material than elsewhere in the book. No one, in 1903, should write of the sestina without citing Kipling's "Sestina of the Tramp Royal," by far the easiest and most natural reproduction in English of Arnaud-Daniel's original unrhymed device. Austin Dobson's sestina quoted is labored and frigid, while Kipling's is the natural marriage of the complicated form to a theme which it conveys better than would any other expression.

The writer's own utterances are more interesting than the examples among which they are scattered. To not many of his statements can exception be taken, yet a few seem to call for comment. On page 19 he says: "Two varieties of the feminine cæsura are also distinguished; the Lyric, when the pause occurs inside a foot; the Epic, when the pause occurs after an extra (hypermetrical) light syllable." This would seem to imply that the Epic cæsura does not occur inside a foot, as of course it does. Not every one will agree with Mr. Alden when he says (page 24): "The fundamental rhythm of both iambic and trochaic verse is the same, as also that of both anapæstic and dactylic verse." This is an error common to most recent books on versification, and vitiates much of their criticism. It seems akin to the error of reading verse by eye rather than by ear. On pages 24, 25 it is not apparent why the terms "ascending" and "descending" are preferred to the shorter and more usual terms "rising" and "falling." We find on page 47, after a quotation from Swinburne, "In this last specimen we have a nine-accent line—very rare in English poetry." This statement is not borne out by the example; Swinburne's rhymes positively mark the words referred to as a line of eight accents followed by a coda-line of one accent. The book does not mention Tennyson's poem on Virgil, which is all nine-accent verses of a very marked structure.

Chapter III., on the stanza, ignores many interesting modern stanza-forms, and gives many middle-English stanzas of little interest in themselves and of small value for the history of the subject, as they exercised little or no influence on later compositions. In Chapter IV., under the heading "Assonance," it seems strange that no mention is made of Emily Dickinson, who often used consonances and assonances in place of rhymes, sometimes with an effect of novelty and charm. On page 129 we read: "These passages illustrate sufficiently the grotesque effects of double and triple rhyme in English—effects of which Byron and Browning are acknowledged masters." This is all very true, but what follows seems to imply that double and triple rhymes are in themselves grotesque or humorous. In fact, Mr. Alden gives throughout the book few if any examples of their dignified use. On page 121 he has said: "Triple rhyme is also recognized, though rare." He seems in this regard to have investigated his material insufficiently. Triple rhyme is much used in verse of the past thirty years, and it is safe to say that the combination of double and single rhymes, where the single rhyme closes the stanza, is the most melodious, emotional, and beautiful of English rhyme-effects; witness Swinburne's "Pastourelle." The dignified effect of triple rhymes, even final, is by no means unusual, as in Longfellow's "Chrysaor" and in Kipling's "The Miracles."

Mr. Alden cites, on page 156, and without comment, Luick's regret that modern rhymed verse requires the reduction to a uniform "tick-tack" of alternating stress and non-stress of the natural accent relations of the Germanic languages, which recognize two principal degrees of accent. The author seems as oblivious as most recent writers on prosody to the distinguishing feature of the development of English versification of late years, namely, the increasing volume of verse employing accents of two degrees; as Poe's "Raven," Kipling's "Last Chantey," and a host intermediate in date. The writers of verse produce this sort of rhythm with ever increasing ease and volume; the writers on verse still fail, generally, to recognize it.

On page 247 Browning's blank verse is characterized as sacrificing more of melody than Tennyson's in adapting itself to the thought. This is failing entirely to realize or express Browning's intentional abuse of discord as a metrical effect, though Mr. Alden does say (page 249), "What in Surrey is helplessness, seems the perversity of strength in Browning." It is difficult to agree with the latter half of his statement (page 391) that "English quantities, so far as they exist, are variable and (in part at least) subjective in character." Again, it is scarcely true, as stated on page 396, that "the number of syllables in the foot (in good modern English verse) is tolerably constant." Mr. Omond, for instance, clearly disposes of this view. On page 409 Mr. Alden says: "There is one defect, it may freely be admitted, in these classical names of feet. They provide no place for secondary accent." This is true indeed of the *names* of the classical feet, but not of the standard nomenclature that goes with them. Reference to so easily accessible a book as the translation of Schmidt's 'Rhythmik und Metrik' would show that such terms as "dipody" and "monometer," "octapody" and "tetrameter," furnish a complete and exact terminology for the distinction from ordinary measures of measures containing secondary accents, and for the accurate characterization of rhythms some of which are found in the specimens quoted on pages 49-55 under the heading "combinations."

Much in Mr. Alden's book is worthy of high praise. The essay on the "Time-Element in English Verse" is full of good things. The quoted utterances of many writers on the "Metrical Element in Poetry" are well chosen and serviceable. The author's statement of the general law of English verse (page 7) is just, and hardly to be improved upon. On page 24 he says: "The foot is determined by the distance from one accented syllable to another in the regular scheme of the metre." "Interval" would be an improvement on "distance" as a matter of wording, but the intention of the definition is excellent. At page 31, on the metre of the "Charge of the Light Brigade" and on a similar metre used by Longfellow, the remarks show unusual insight and delicacy of ear. An instance of Mr. Alden's poise and caution appears on page 35, where he says of certain Elizabethan rhythms, "It is quite possible that the time to which these verses were sung may have affected the measure." On pages 55, 56, what is said of the terms "pyrrhic" and "spondee" is just and rational; and likewise of tone-color on page 136. Insight is again shown on page 226, where attention is called to Fletcher's many twelve-syllable lines as being ordinary lines with triple-endings, not Alexandrines.

On pages 394, 395, and again on 400, are some noteworthy observations on the relation between music and verse. On page 408 is another of the same kind, together with a good sample of Mr. Alden's acumen: "It has been suggested more than once that the great preponderance, among English dissyllables, of those accented on the first syllable, goes to explain our preference for iambic over trochaic measures; and that one reason why the rhythm of 'Hiawatha,' for example, so soon wearies the ear is because its metrical divisions and word-divisions so frequently coincide." Most writers on verse make too much fuss about metrical notation. Mr. Alden uses none at all; considering, apparently, that his general observations and his classification sufficiently indicate the metrical form of his examples.

Whereas Mr. Alden for the most part particularizes or lets his frequent citations speak for themselves, Mr. Omond's excerpts are relatively few, and he deals chiefly in generalizations or in theories. His theorizing differs from that of most writers of versification. Usually such an author begins by assuming that all other writers on the subject are dolts and all its students dullards. Then he states a theory as a universal panacea for all difficulties of verse criticism. Far otherwise is it with Mr. Omond. However much his readers may differ with him, no one can fail to be won by the disarming candor and unassuming moderation of his utterances. We note a few blunders, perhaps of the proof-reader. On page 58, in a long sentence, "as he chooses" is left hanging in the air, no person having been mentioned or referred to. On page 142, "in last paragraph" is not merely faulty English; it is not clear what is the last paragraph meant. Elsewhere Mr. Omond's English is noticeably good, nor do we recall any book on this subject written in a style so pleasing.

Mr. Omond's other theorizings we pass by, but nothing short of amazing is his most original theory (set forth especially on pages 52, 53), that our double rhythms correspond to the movement of such classic metres as the anapæstic and dactylic, while our triple rhythms correspond to the movement of such classic metres as the iambic and trochaic; thus reversing the relationship between our rhythms and classic metres, as it is generally understood and accepted, and as is reflected in the customary application to the feet of our rhythms of the names used for the feet of classic metres. We regard this theory as totaly wrong, but it is stated so modestly and plausibly that we rec-

ommend each reader to consider it for himself.

The book is full of quotable passages, some of which are almost epigrams. For instance (page 43): "A dropped accent, like a dropped syllable, may minister to our perception of periodic recurrence." Page 57: "Syllabic variety contrasted with temporal uniformity creates the charm of English metre"; and below: "When syllabic variety overpowers temporal recurrence, a line ceases to be metrical." Page 59: "The perfection of music lies in absolute accordance with time, that of verse in continual slight departures from time"; and again: "On the other hand, to suppose that this imperfection is in itself rhythmical—that these aberrations from type, variations of stress and quantity, and what not, constitute in themselves the law of verse—would be a still more fatal blunder." Page 60: "Variations are not rightly understood till it is known from what they vary." Page 75: "Pranks of new writers may demonstrate their authors' incapacity, not their readers' stupidity"; "Variation is successful only when it brings into relief, not obscures, our perception of underlying uniformity." Page 110: "Final rhyme, no doubt, accentuates to our ear the termination of a line, but it does not cause termination."

Sensible and well-judged are Mr. Omond's utterances on quantity in English. For instance (page 33): . . . "distinguish—as even eminent critics have not always done—the fact of quantity from the classic rules for its observance." Page 41: "We do seem to come upon traces of a real use of quantity . . . supplementing accent. . . ." Page 45: "Neglect of it, with us, rather deforms than destroys structure, making a line unmusical rather than unmetrical." Page 46: "It may be an added grace rather than a structural necessity." Pages 154, 155: "Greek dactylic lines of course begin with a long syllable. To imitate this, our hexametrists endeavor to begin their lines with a syllable of strong accentuation. But they never can keep it up for long. It is opposed to our habit of speech. All our native verse either begins with weak syllables or admits them as an alternative."

There are many instances, too, of almost epigrammatic expression of Mr. Omond's unassuming modesty, as (page 48): "No one can tell beforehand how English verse should be written; we can determine only how it has been written." Page 121: "My scansions must be taken as suggestions, not as *ex-cathedra* judgments." Page 139: "Prosodical pontiffs should least of all claim infallibility."

The kernel and gist of the book, the author's views on how English verse should be read, scanned and understood, may be gathered from such passages as (page 31): "Temporal periods, usually occupied by syllables and habitually denoted by stress, must be regarded as the true basis of our verse." Page 53: "Time-spaces exist apart from the syllables embedded in them." Page 84: "Syllables do not correspond precisely to beats. They do not keep perfect time, like notes of music, but the time itself is unvarying." Page 85: "Periods are the actual units, and the way to scan a poem is to discover its time-measure, and then consider the relation of syllables to time."

Mr. Omond's recognition of the existence of quadruple (what in the classical terminology are called pæonic) rhythms in English, and his allotment of a chapter to their consideration, mark him as possessing more insight than most writers on versification. His acumen is also unusual. For instances of its exhibition we refer to his treatment (page 27) of the method of scansion (?) which divides verse into the units of prose-phrasing; to his illuminating comparison (pages 91, 92) of the rhythm of Shelley's "Cloud" with that of his "Vision of the Sea"; to his keen analysis (page 129) of the rhythm of Campbell's "Battle of the Baltic"; to his comprehension (pages 135, 136) of the subtleties of Christina Rossetti's rhythms; to his characterization (page 145) of the rhythm of Tennyson's "Alcaics."

The index it lacks, the book deserves. Mr. Alden's manual has a good index.

The Persian Problem: An Examination of the Rival Positions of Russia and Great Britain in Persia. With some account of the Persian Gulf and the Baghdad railway. By H. J. Whigham. Scribners. 1903. Pp. xvi., 424.

Events nowadays follow fast in the East, and that part of Mr. Whigham's book which deals with the Persian Gulf is now very fairly antiquated. Whatever the immediate cause was, England has at last spoken and unmistakably, and all others stand now warned off from attempted control of any part of the waters or shores of the Gulf. The Baghdad railway, therefore, unless it stops at al-Basra, can reach tidewater only at what will be virtually a British port. Thus that control of its southern end which Mr. Whigham desiderates is practically assured. Nor can there be any longer a question of Bunder Abbas or any other place being "given" to Russia by England—or whatever the correct word may be for the transfer of property by some one to whom it does not belong, to some one else who has no right to it. Further, what consequences will follow from this for the interior of Arabia and the century-old feud of the Wahhabite state at Riad and the family of Ibn Rashid at Haïl, is past the most daring prophecy. When England does abandon its traditional limitation to the coast and moves into the chaos of the interior of Arabia, strange things will undoubtedly happen. These Mr. Whigham only touches; his point is Koweit and its unruly chief, Mubarak, and he is confessedly shaky on the interior. His guess, then, that the power to be cultivated is the anti-Wahhabite one of the Ibn Rashids is all the more commendable.

Turning to Persia and the eastern side of the Gulf, his judgment seems equally clear. Although in close touch with Lord Curzon and an admirer of his classical book on Persia, he does not hesitate to criticise him and it. The great English error with Persia has lain in holding that the time had not yet come for railways; that roads must precede. Years ago, rather, railways built by British capital should have been run from the Gulf north and east. Given these, Russian railroad-carried goods could never possibly compete with English goods brought by sea; the essential difference of freight rates by sea and by rail must prevail. Further, the problem of Persian commerce, within and without, is one of communications; Persia cannot be opened up and developed as to minerals or cereals until it has a railway system. The natural riches are there, but the cost of carriage by caravan is prohibitive. So the mining corporation of twelve years ago found. Rich manganese ore was plentiful, but it cost £9 to £10 a ton to get it to the coast, while it sold in London for only £4. With a railway the freight would have been some ten shillings. As it is, Persian imports largely exceed exports, and the country must be approaching bankruptcy. All this, as put by Mr. Whigham, seems undeniably sound.

But is it worth England's while, it may be asked? Has English trade not already practically vanished? According to the figures in the 'Statesman's Year-Book' for 1902, England has only 24 per cent. of the exports as against Russia's 56.3 per cent., and 27.4 per cent. of the imports as against Russia's 55.9 per cent.—a truly deplorable showing, and one which has excited wide English comment. But, again, Mr. Whigham brings out that these figures are not official or trustworthy in any respect. He has his own set of figures, which make the British share in Persian imports from 40 to 42 per cent., a more respectable result.

Such are only a few points in this most readable book. Its grasp and insight, independence and clarity, make it a very real contribution to a very perplexed subject.

Experiments on Animals. By Stephen Paget. With an Introduction by Lord Lister. New and revised edition. G. P. Putnam's Sons. 1903.

The constant clamor of anti-vivisectionists, protestants against all operations upon the lower animals, whether for experiment, for illustration, or for the prevention of suffering among their own kind or in man, has inspired this authoritative account of the result of such experimental work. The objectors admit that pain may legitimately be inflicted when a substantial advantage is to be gained, but they deny that any good has ever resulted from the researches they condemn. The admission simplifies the question, for it thus becomes merely one of fact, and the facts do not accord with their contention. Galen proved that blood is contained in the arteries, which his predecessors did not believe; Harvey discovered its circulation, the cornerstone of animal physiology; and Malpighi observed the capillaries. Hales and Hunter, Poiseuille and Marey supplemented these observations, all necessarily experimental, and completed our knowledge of the subject. This is but the A B C of experimental physiology, which has been developed by the demonstration of digestion, of the formation of glycogen and sugar, of the action of the pancreas, of the development of bone, and of the functions of the nervous system—all by similar methods. Can it be imagined that the intimate operations of the body are to be thought out, instead of being wrought out under careful observation? Physiology secure, the practice of medicine has been enlightened by a knowledge of the action of remedies learned by experiment upon animals and by trial on man. Anthrax, tetanus, diphtheria, plague, rabies, tubercu-

losis—taken almost at random—are among those uniformly dangerous and generally fatal diseases some of which, at least, have had their power greatly limited, if not destroyed, by the very work which the well-meaning obstructionists so earnestly condemn.

Mr. Paget, as Lord Lister explains, is not personally engaged in researches involving experiments upon the lower animals, but, as Secretary of the Association for the Advancement of Medicine by Research, he has become well qualified to lay the actual facts plainly before the public. His book should be studied by both parties. For the general public, unconcerned with the ethics of the question whether animals should be utilized to preserve the lives of other animals and of men, there is an excellent account of the immunizations practised against diphtheria, rabies, tetanus, plague, cholera, and typhoid fever—with different degrees of success, it is true, but on the whole with a magnificent aggregate of lives saved.

In giving credit to Sommelweiss for his work upon the nature of puerperal fever Mr. Paget fails to note, doubtless from want of knowledge, that Oliver Wendell Holmes preceded him in the same field. He speaks with the customary derision of the "doctrine of organs and bumps," though the higher phrenology has no concern with "the bumps of the anti-phrenological buffoons," as Gall himself puts it, but with the localization of the mental functions. He has more faith in Sanarelli's *bacillus icteroides* and in his immunizing serum than we are disposed to yield; and on the strength of the Durham and Myers Commission he seems at one place (p. 283) to question the conclusions of the Walter Reed Commission, and therein is undoubtedly weak. In fact, that passes a little beyond his theme. For a minor detail Mr. Paget persists in styling Major (now Colonel) Gorgas "Surgeon-Major," a title not used in the United States army, and now obsolete even in Britain.

The Sculptures of the Parthenon. By A. S. Murray, LL.D., F.S.A., Keeper of Greek and Roman Antiquities, British Museum. London: John Murray; New York: E. P. Dutton & Co. 1903.

Dr. Murray is well known as a writer on classical archæology. He published in 1883 a history of Greek sculpture in two octavo volumes, and a Handbook of Greek Archæology in 1892, not to mention minor publications connected with his position in the British Museum. He is accepted as a trustworthy archæologist; but there is no evidence in his books above named, or in his rather numerous articles in English periodicals, that he possesses a very strong sense of the artistic side of Greek life. This would seem an almost obvious necessity, for to many persons it is a truism that archæology and art are different and opposed things; yet there are instances enough of the contrary condition—of men brought up as scholars developing a singularly keen sense of the beauty and the artistic character of classical sculpture. Dr. Murray's present work is valuable in that it substitutes photographic reproduction for the outline plates with which other books on the subject have been illustrated. If, for instance, we compare this book with the well-known stand-by, Michaelis's 'Der Parthenon,' we note that the latter, a folio, gives the famous frieze of the cella complete in sufficiently well-drawn outlines. Beginning with the western frieze, to which one double plate is devoted, passing to the frieze on the longer south side, to that on the north side, and finally to the culminating groups of the eastern frieze, the whole composition, or series of compositions, is revealed so far as they are preserved. The slabs may be in Athens, in Paris, or, more often, in the British Museum; they may even come to our knowledge only through the drawings of Carrey in the seventeenth century, or Stuart in the eighteenth century, the marbles themselves being destroyed; but all that is known of the frieze is spread before the reader, in rough but comprehensible engraving. Now in Dr. Murray's octavo there is to be found, in a pocket at the end, a very large folding plate (xiii.): and this gives "the four sides of the frieze as exhibited in the British Museum, and copies of Carrey's drawings from parts of the frieze now missing." These are shown in photography, drawings, and slabs alike. It is true that there is no statement in the legend of the plate to the effect that this representation "in the British Museum" is partly in the form of plaster casts from the slabs preserved elsewhere; but the difference for the student is not very great. To take it in detail and to use the numbers of the figures, men and women, adopted by Michaelis and followed by Dr. Murray, numbers one and two of the north frieze are known to us only by the Carrey drawings, and these, in the Murray plate, are separated from the rest of the frieze, whereas in Michaelis they have their place at the beginning of the long procession. Numbers three to eleven are from originals which are all in the Acropolis Museum at Athens, this embracing a portion of the frieze seven times as long as it is wide. Then follow slabs that are in the British Museum, and others that are in Athens, alternating, as it were, throughout the whole length of the frieze; for indeed it is just about half, or rather less than half, of that frieze as it was once, that is now in London. Except that the reader might be misled by the implied statement that the whole is "exhibited in the British Museum," into the belief that more of the frieze is there than is there in reality, there is no fault to be found, and the photographic reproduction of these slabs brought all together in sequence according to the latest rulings of archæologists is a really important contribution to the general knowledge of the subject among students of art.

So with the metopes. Folding plate x. gives photographs of the metopes of the south side, most of them from the marble or the plaster, but many from Carrey's valuable drawings; and the first pages of chapter four, which is devoted to the south metopes, tell the story of the relation of these to the modern world in a very complete fashion, besides dealing with their general subject. Chapter five is devoted to the metopes of the north side; but of all these sculptures only one is given in photography, a large picture occupying the whole of plate xi.; while plate xii. shows a few drawings made in the seventeenth century by another artist than Carrey, and a few by Carrey himself. As for the pediments, the very proper course has been taken of presenting the Carrey drawing of each, namely, in plates iii. and vi., with photographs in the following plates of the separate figures as far as they can be identified, or approximately identified, and one or two pieces of sculpture not of the Parthenon by way of further illustration. Folding plates iii. and vi., which, as above stated, give Carrey's pediment drawings, give also something more than they: that is to say, the front view of the pediment is completed, in a way, by work done upon what the early artist left for us. The architectural framework is put in, capitals of the columns, the entablature, and even the metopes "in their present state." Such a quasi-restoration must always be of doubtful propriety; it will help students to understand the situation, but also it will tend to mislead them as to what it was that we have under the well-known name of Carrey's drawings of 1674.

If, however, one will read the text of this book, he will not be misled. No doubt is left as to what is authentic and what is traditional or supposititious. The story is completely told; the great mass of sculpture is placed aright and the history of it related. To make this book all that we could wish it, we need, as we began by intimating, a much more profound sense of what the sculpture of the time of Phidias means to modern artists and lovers of art.

Financial History of the United States. By Davis Rich Dewey. (American Citizen Series. Edited by A. B. Hart.) Longmans, Green & Co. 1903. 8vo., pp. xxxvii, 530.

Examination of Dr. Dewey's annotated bibliography at once reveals a reason, perhaps a chief reason, for the unquestionable superiority of his book over its only rival in comprehensiveness. Since Bolles's 'Financial History of the United States' was written, almost twenty-five years ago, the studies of Bullock and Catterall and Kinley and Knox and Noyes and Sumner, not to mention others perhaps equally deserving, have prepared the way for a more intelligent account of our financial experience than could have been written in the eighties. Into the labors of these men Dr. Dewey has entered. But he has abundantly justified his inheritance. Not only has he coordinated the results reached by others; he has also labored on his own account. He has steadily endeavored, and not without success, to trace the relations between financial legislation and democratic sentiment in the different stages of our industrial progress. In other respects also he has supplemented the deficiencies and filled in the gaps of the monographic literature; and he has never allowed a convenient monograph to seduce him into the undue expansion of an episode. An admirable sense of proportion is everywhere in evidence, and gives to the newest 'Financial History of the United States' a unity which works of the sort too frequently lack.

Throughout the book, from the account of the beginnings of colonial taxation to the comment on the Currency Act of 1900, Dr. Dewey's open-mindedness is likewise conspicuous. Indeed, he is almost too open-minded. At times he maintains an attitude

of such resolute impartiality between the competing explanations of fact which he enumerates, or the conflicting arguments of politics which he epitomizes, as deliberately to leave us uncertain towards which side, in his opinion, the balance of probability really inclines. This course he defends on the ground that "historical study is more fruitful if the reader endeavors to interpret the past in accordance with the experience which was available at the time the occurrence took place." That depends, of course, upon the fruit which the student of history desires to gather. Believing, for our part, that the fruitfulness to the American Citizen of historical studies upon "the relation of financial legislation to democracy"—the very topic which Dr. Dewey has "kept constantly in mind"—must be found chiefly in the instruction which such studies may afford him for his future guidance, we regret that Dr. Dewey has not allowed himself occasionally to assume a more magistral air. We feel entitled to the assistance of his judgment.

We cannot help regretting, too, that, as in many another good book intended for use in our colleges, Dr. Dewey's five hundred pages of text have been chopped into some two hundred sections, each bearing a caption in black-faced type. By this device, to be sure, the eye of the indolent professor is caught, and the incipient American Citizen is saved the strain of analyzing for himself what his instructors may require him to read. But, on the other hand, a narrative which, if left to itself, would possess sequacious interest, is transformed, as far as possible, into a series of unattractive tasks. Dr. Dewey's narrative deserved more dignified treatment. It is, in substance, a book for men, in college or out; and the supposed commercial necessity of making it appear a book for college boys is not an encouraging sign. But this is a criticism rather of the times than of the book. The book itself is excellent. Scholarship and insight have gone into it. No careful student of American history can afford to neglect it.

A Journey to Lhasa and Central Thibet. By Sarat Chandra Das. E. P. Dutton & Co.

It stirs the imagination to think that there is still one "hermit nation" left in the world, which contains also the holy place the very name of which thrills at least one-third of the human population of the globe. Those who guard the pathways to Lhasa and keep the holy city inviolate know well the official and commercial value of mystery. So long as the guardians of the supreme Lama, the living incarnation of Buddha, allow only the elect and gift-laden pilgrims to gaze on "our Lord's" face, they can hope to keep up the lucrative mystery-play.

The hierarchy is proud of a "succession" beside which that in the Occident called "apostolic" is modern. The monks fiercely resist the entrance, on any pretext, into Lhasa of diplomatists, travellers, traders, explorers. So long as they can do this, the millions and hundreds of millions of vulgar but believing folk in Chinese Asia, including Japan, will hold to the "Western Paradise" as a concrete reality. Geographical conditions do not favor or point to the possibility of extensive pilgrimages from the ends of the Buddhist earth to the Thibetan plateau, though highland Asia still furnishes a pilgrim army of millions annually. Only a few score of hundreds of distinction —tribute-bearing devotees—see the face of the incarnate Buddha, most of those coming from afar being made content with the subordinate lamas, who derive the validity of their holy orders from the one Dalai at Lhasa.

The chief interest of this narrative of a Hindu pundit's journey into Thibet lies in his account of a visit to the Buddhist capital, Lhasa, and audience of the living Buddha, to whom he brought a present of gold, the tribute of the lamasery in which he was a student. He made the journey to Lhasa in 1881; and since 1890, at various times, much of what he learned and saw in his Thibetan travels has been made public in India and England. The publication of this volume, the second edition, revised, has probably been called forth by the special interest awakened in Thibet by the recent works of Rockhill, Landor, Reinhart, Sven Hedin, and others. It is edited with abundant notes by Hon. W. W. Rockhill, who met Sarat Chandra Das, now of the Bengal Educational Service, in Peking in 1885. There are a biography of the author and traveller; a good index, maps, plenty of illustrations reproduced from photographs; colored plans of Lhasa monasteries, and a fascinating chapter on Thibetan social life in a great variety of aspects. In a word, here is an excellent and satisfactory book for the student of contemporary Buddhism.

Making friends with the Lama who was a teacher of Tibetan in the Government school at Darjeling, in India, Mr. Chandra secured an invitation to visit Lhasa and enter his name as a student of theology in the Grand Monastery of that city. He spent fourteen months in Thibet. Only two natives of India, in the nineteenth century at least, had succeeded in entering the forbidden city. Even Mr. Chandra was unable, for prudential reasons, to see all he desired, but what he did see is of great interest to the student of religions. Those familiar with the artistic representations, within the temples of China, Japan, and Korea, of the various avatars of Buddha, will enjoy the descriptions here given of the ancient originals. One almost wonders whether Milton's figure of Sin, in 'Paradise Lost,' was not suggested by that of the terrific goddess Poldan Lhamo—offspring of a red ass and a winged mare—who is guardian of the Dalai Lama.

The rows of prayer wheels, the steep ladders by which the top floor of the nine-storied Potala (or Lama's palace) was climbed, the superb view of varied scenery, the gilded spires of the city's temples, the vast façade of lofty whitewashed wooden structures, the crowds of singing beggars in the streets, the rich brocade and hangings of the throne room, the eight rows of rugs on the floor, the golden censers, bowls of water, and other sacred utensils, the "bright and fair complexion and rosy cheeks" of the incarnate Buddha, the tea-drinking, rice-eating and saying of grace, the blessing of the auditors by the holy pope, the reception of the consecrated pills and neck-scrap of red silk in return for the presents—all show in what a real sense, to probably three hundred millions of people or more on this earth, lamaistic Buddhism is the true religion. Lhasa is still an actual rival to Rome, Constantinople, Moscow, and Canterbury.

The scientific student will enjoy reading of the babu's exact measurement of Lake Palti and his further explorations. Mr. Rockhill shows that, in both geography and literature, Sarat Chandra may safely receive the honors which belong to explorers and scholars in the West. He is now engaged on a Thibetan-English dictionary of two thousand pages, exclusive of the long-desired Sanskrit-English appendix of Buddhist terms.

APPLETONS' EXPANSION SERIES

ALREADY PUBLISHED

THE HISTORY OF THE LOUISIANA PURCHASE

By Dr. JAMES K. HOSMER, Author of "A History of the Mississippi Valley," President of The American Library Association.

"The author is singularly interesting when describing the quarrels over the subject as carried on by Napoleon and his brother Joseph. . . . The final chapter is an excellent summary of the situation past and present."—*New York Times Saturday Review.*

OHIO AND HER WESTERN RESERVE

With a Story of Three States Leading to the Latter from Connecticut, by Way of Wyoming, its Indian Wars and Massacre. By ALFRED MATHEWS, Member of the Ohio State Archeological and Historical Society, etc.

"The book will naturally become a household word in the region of which it is a history."—*Cleveland, Ohio, Town Topics.*

"Mr. Mathews writes of his State with a loyalty that amounts to pride—a fault, if it be a fault, that is easily pardoned, for Ohio has much of which any State may well be proud."—*Chicago Chronicle.*

"The book bristles with information about Ohio's noted men viewed from the ancestral standpoint. . . . He has put forth a valuable history of the whole State."—*Pittsburg Post.*

THE HISTORY OF PUERTO RICO

By R. A. VAN MIDDELDYK, Librarian of the Free Public Library, San Juan, Puerto Rico. Edited by MARTIN G. BRUMBAUGH, Ph.D., LL.D., Professor of Pedagogy, University of Pennsylvania, and first Commissioner of Education for Puerto Rico.

"Worth reading by all who are interested in the development of the country."—*Philadelphia Inquirer.*

"This book is of much value not only as being the only history of Puerto Rico available, but for its intrinsic merits."—*Newark News.*

"It affords the American people a clearer insight into the past history, the present conditions, and the future needs of the island."—*Chicago Inter Ocean.*

HOME SCHOOL for Boys and Girls from Kindergarten to College. Thorough Instruction, Manual Training, Gymnasium, and good Home Care. With six regular and as many special teachers, much individual attention is given. Forty-fourth Year begins Sept. 30. Apply for Catalogue to BENJ. WORCESTER, Prin., Waltham, Mass.

New York University Law School } Sixty-ninth year opens Oct. 1, 1903. **Day Classes** with sessions from 3:30 to 6 P. M. **Evening Classes**, sessions 8 to 10 P. M. Graduate classes lead to LL.M. and J.D. Tuition $100. For circulars, address L. J. TOMPKINS, Registrar, Washington Square, New York.

THE MISSES METCALF'S
Boarding and Day School for Girls
Tarrytown, N. Y. College Preparation. Physical Culture, Tennis, Basket-ball. Reopens September 22d.

SOUTHERN HOME SCHOOL
FOR GIRLS. 915-917 N. Charles Street, Baltimore, Md.
A Boarding and Day School. Sixty-second year October 1st, 1903. Miss DUFF and Miss PENDLETON, Successors to Mrs. CARY and Miss CARY.

The Browne and Nichols School
Cambridge, Mass. For Boys. 21st year. Course, 8 years. Classes limited to 15. Pupils continuously under head teacher in each department. **Exceptional facilities for fitting for Harvard.** Illustrated Catalogue.

The Highland Military Academy
Worcester, Mass. 48th year. Best sanitation; high scholastic standards. Military training with home care. Well-appointed laboratories. Visitor: The Rt. Rev. Alex. H. Vinton, D. D, Head Master: JOSEPH ALDEN SHAW, A. M.

THE LEE SCHOOL,
9 Channing Street, Cambridge, Mass.
Miss M. L. KELLY, Principal.

The Temple Edition of
THE WORKS OF
Charles Lamb
Edited by WILLIAM MACDONALD.
With Essays, Biographical Introductions, and Notes.

This Edition includes among its distinctive features (1) Appropriate daintiness of setting; (2) Profuse illustration, comprising some 500 drawings by modern artists, reproductions from the original engravings, and portraits; (3) Methodical grouping, careful editing, and, by the inclusion of much copyright and hitherto unpublished matter, general completeness.

In 12 vols. long fcap, 8vo (4⅝ by 7¾) $16.00 *net* per set.
Also 100 sets on Large Paper, $50.00 *net* per set.

NOW READY
The Essays of Elia
With Essay: 'On Editions Past and Present,' by the EDITOR. Illustrated by C. E. Brock.

The Last Essays of Elia
With Biographical and Critical Memoir, by the EDITOR. Illustrated by C. E. Brock.
Other Volumes shortly.

*** *Detailed illustrated Prospectus post free.*

"This is a form in which the lovers of Charles Lamb will be glad to have his works. It seems to be in almost every way a fitting embodiment of his spirit. The little volumes are extremely charming; easy to hold, easy to read, and with a certain elegant distinction of page, typography and paper."—*N. Y. Times Saturday Review.*

The Nation.

NEW YORK, THURSDAY, AUGUST 13, 1903.

The Week.

If the naval war game just ended enables the people of the United States to realize how easy it is to defend our coast line with our present forces, it will have served a useful purpose. For the second time a squadron of the fleet has attempted to find its way undiscovered into one of several harbors in a long stretch of coast. Each time it has failed so ignominiously as to give a touch of the ludicrous to the whole performance. This should bring up afresh the question why this nation goes on building ship after ship if it be not for offensive purposes. Hitherto, and particularly because of the glamour of the successful war with Spain, there has been so little opposition to the piling up of our naval armament as to have brought us to the formation of navy leagues, and to proposed building programmes which would add yearly five or six costly vessels to our fleet. Now we are glad to note that there are growing signs of a reaction from the Rooseveltian extreme of a navy nearly if not actually as large as England's. His view of our needs is not that of our conservative navy officers, nor of Capt. Mahan. This well-known writer does not forget, in surveying the situation, to take into account the strategic advantages offered by the Atlantic Ocean, or the defensive qualities of our costly new coast fortifications, which we keep garrisoned by some 18,000 men. If we must have a "building programme," let it be one founded on common sense, and not one inspired by fatuous emulation of the follies of over-sea nations, whose ambitions and jealousies so sharply conflict.

Unwilling to believe the current press reports, particularly widespread in the South, that the Navy Department contemplated withdrawing all colored men from the service and stopping further enlistments, the *Evening Post* applied to headquarters, and received from the Acting Secretary an emphatic denial. "The question has never been proposed nor considered. The Department would not favor taking such a step, and it is difficult to understand how a person otherwise qualified could be denied enlistment on color ground alone." This should finally dispose of the canard. Matters would come to a pretty pass, indeed, if the army and navy of the United States were to be closed to the colored men who have fought well on every battlefield and in every naval action since 1862. In the army the negro regiments are in many respects the best in the service; certainly the black enlisted men are more faithful to their duty than the whites. In the navy, colored and white men fought side by side at Manila, as they did at Santiago. Not until the present unfortunate outbreak of race prejudice has there ever been a murmur of discontent from the navy, where blacks and whites from all sections of this country have always eaten and slept side by side without the slightest friction.

Mississippi's answer to President Roosevelt's assertion of the national supremacy at Indianola is the election, as Governor and Senator respectively, of two men who stand for the denial of education and opportunity to the negro. Senator Money, who triumphed in the primaries over his more liberally minded rival, Gov. Longino, put the race question to the front in all his speeches. It will be remembered that, in open Senate, he declared that "if every colored man in the South had been graduated from the finest university in Europe or America, he would not be fit for the obligations or duties of American citizenship." This is the man whom Mississippi delights to honor. And for Governor the State has chosen a candidate who advocates a division of the school fund between the races on the basis of taxes paid by each. This reactionary step was taken in the face of such appeals as that made in the course of the canvass by Judge Powell of the Lincoln County Court, who said:

> "I confess I can't understand this foolish hostility to the negro. . . . He has been eliminated by our Constitution and laws from all political control. He asks not for social recognition. He only asks the poor privilege of working for his daily bread in peace. . . . It strikes me that for us to oppress where we should protect, to debase where we might lift up, is unmanly and unworthy of the proud race to which we belong."

But, of course, it is only the North that is reopening the negro question.

Gen. J. B. Gordon, the commander-in-chief of the United Confederate Veterans, has headed off an attempt to get up a veterans' meeting at Sulphur Springs, Alabama, in order to endorse peonage and to resent the unwarranted interference of the North in the affairs of the South. Writing to Gen. Harrison, the commander of the Alabama division, Gen Gordon said that any support of peonage would be "a sad mistake," and that even remotely touching upon the subject would impair the influence of the veterans. Gen. Harrison immediately called upon every Alabama veteran to heed "the timely admonition of Gen. Gordon," which is also endorsed by some of the leading Alabama newspapers. Thus, the Birmingham *Age-Herald* declares that it "fairly and fully voices public sentiment," and points out "that the line between personal sympathy for offenders and the practice of peonage itself is very thin." It is so thin that any extravagant expressions of sympathy or any criticisms of Judge Jones would be sure to react on the good name of the State.

In the confusion, anxiety, and apprehension of the investment markets, one fact stands forth unquestioned: this is no time for real holders of securities to sell. It is an unfortunate tradition of the markets that the public habitually buys at top prices in a "boom," and sells at low levels of depression. The one course of action is as senseless as the other; combined, they mean heavy and repeated losses to outside investors. Both the buying and the selling referred to have their inspiration, not in cool and observant good judgment, but in the psychology of the crowd. Because of the example of a lot of excited people, sober men do what they would not think of doing by themselves. It is time to warn the owners of investment securities most emphatically against such folly. With all its obscure elements, the situation as a whole is plain. People who make a business of dealing in securities have bought too many on borrowed money and have paid too much for what they bought. With stringency in the general money market, they have been forced to sell; some of them have confessed insolvency. As a consequence, securities have been marketed at any price obtainable, simply because the owner had to raise money. But all this is the clearest imaginable proof that the man who does not have to sell, who has paid for what he holds, should take no precipitate step. We make no prediction as to the future course of values, but we are very certain that sound securities are intrinsically at least as valuable as they were in the "boom days" of a year ago; that sane owners of property do not sell when bidders have withdrawn and other holders are being forced to liquidate; and that, if the investing public keeps its head, the Stock Exchange will prove only a temporary danger-point.

What induces the International Mercantile Marine Company to accede completely to the demands of the British Admiralty and Board of Trade is not wholly apparent. The company binds itself strictly in the matter of manning ships with British subjects and keeping subject to requisition, under the terms existing previous to the consolidation, all English lines now or to be controlled by

it. These substantial concessions to the Government fall curiously with the notice of withdrawal of subsidies from the lines in the combination, and of liberal aid extended to the independent Cunard Company. Pending an authoritative explanation, it would appear that the so-called Ocean Trust was open to legal attack, and prudently avoided having its organization tested in the British courts. It would have been an awkward pass had it turned out that the British ships taken over were entitled neither to American nor to British registry. The Belgian flag or the piratical status would have been an embarrassing alternative. Meanwhile, it should be said that the conditions imposed upon the company by the Government do not seem likely to interfere with the service of the various lines. The agreement does, however, finally reduce to absurdity the plea that the enterprise was everything but an international promotion. If the surrender is calculated to grieve those simple-minded Americans who divined a patriotic intention, it may mollify somewhat the ruffled British investor, whose good-will may be worth something even at this late hour.

The Cunard subsidy plan is an excellent example of a straightforward business agreement between a great steamship company and the nation whose flag it flies. Note that there is no pretence of fostering the British merchant marine; all is business. The Postal Department and the Admiralty require respectively transportation of mails and auxiliary cruisers officered and manned. For these services they offer the Cunard Steamship Company a specific consideration, which is not properly designated as a subsidy. Commendable features of the contract are a fixed price for carrying the mails instead of the usual arrangement by weight, and the means by which the Government secures the delivery of the ships with a large body of officers and men in time of war. It is advantageous, too, that the recompense for each service should be awarded separately. This prevents the confusion which arises when mail and naval subsidies are contained in one amount, nominally covering only one service. For twenty years the British Post-Office Department will pay $340,000 for a weekly fast delivery between Queenstown and New York; the Admiralty will pay a retaining fee of $375,000 a year on each of the new twenty-five-knot boats, and will virtually gain control of the entire Cunard fleet with the contingent use of all the officers and half the seamen. For this double service the Government advances $13,000,000 to the Cunard Company for construction purposes. While this arrangement was undoubtedly hastened by the formation of the so-called Shipping Trust, it bears no marks of rawness, and is safeguarded at every point in the Government's interest. A similar policy at Washington would be preferable to that of reckless increase of the navy, which is now in vogue. But such a contracting company must give a return for its pay—must, for example, run its six-day mail boats on a six-day basis; and not, as our heavily subsidized American Line does habitually, on a basis of seven or eight days.

The uselessness of hasty legislation to "curb the Trusts" is illustrated by the decision of an Ohio court, which has just declared the criminal section of the anti-Trust law of that State null and void. The statute was passed two or three years ago when such enactments were in fashion. It provided that the Attorney-General of the State, or the prosecuting attorney in any county in which a Trust existed, might forthwith institute quo-warranto proceedings to oust it from its charter or franchise, and, further, that any violation of the law might be punished by a fine of not less than $50 or more than $5,000, or by imprisonment for not less than six months or more than a year, or by both fine and imprisonment. Under the law each day of violation constituted a separate offence. Proceedings were instituted against seven members of the Coal Exchange of Massillon, it being alleged that they combined to prevent competition, restrict transportation facilities, and fix the price of coal. The defendants were found guilty in the lower court, but on appeal the penal provisions of the act were declared unconstitutional. One of the grounds of this decision was the indefinite language of the statute, which, it was held, did not define a Trust with sufficient accuracy for a penal statute.

It is not strange that the latest form of swindling concern to be exposed is an "underwriting" company. The public has read of the enormous cash fees and stock bonuses paid to launch the new industrial corporations, and has got the idea that "underwriting" will float the crankiest speculative craft. Equally large and vague is the common judgment of the proper sum to be paid for the injection of buoyancy into soggy securities. Staggering fees have been paid over by the United States Steel Corporation, for example, with little criticism. It has been assumed that no price could be set for this essential service. How can you appraise a life-belt in calmness of mind when you must swim far beyond your probable strength? Naturally, the owner of the belt charges all he thinks you will stand, and you pay what you must. Taking advantage of this haziness and hopefulness in the whole matter, the underwriters recently raided in Wall Street did a thriving business in petty swindling. Plenty of people wished to be underwritten. It is convenient whether one has a boarding-house to run, a mining prospect to exploit, or an inventive gimcrack to market, to have some one who will engage to supply the funds. This the new-style underwriters confidently agreed to do. As for fees, they charged them at random, sometimes in tens, occasionally in hundreds. Those who signed the checks must have chuckled when they compared the price of their underwriting with that recorded of the great corporations.

A new and interesting phase of the prevalent pure-food agitation is the effort which a Milwaukee Health Department official is making to bring the boarding-house tables of that city under inspection. He is preparing an ordinance which will soon be introduced in the Common Council, providing certain standards to which the food served in boarding houses and hotels must conform. In other words, just as commercial cream must contain a certain percentage of butter fat, so must the boarding-house hash (that delight of humorists since the days of Aristophanes) contain a fixed proportion of wholesome lean meat. The ratio between chicory and Mocha in the coffee will likewise be prescribed. There is, perhaps, no other place where the hungry man is under the same obligation to eat what is set before him as in a boarding-house. It is only right that he should know, however slender his purse may be, that some disinterested person kindly watches over the food on his table. There is usually some difficulty in carrying through a law of such a drastic character, but in this instance, as a Milwaukee paper pertinently points out, the number of voting boarders is so enormously in excess of the number of voting boarding-house keepers that no serious political reaction is to be feared.

An instance of the failure of labor unions to keep faith is reported from the Northwest. The *Spokesman-Review*, a daily newspaper of Spokane, Washington, entered into an arbitration agreement with the President of the International Typographical Union. Both sides bound themselves to submit to arbitration any and all differences over wages and hours of labor. There was to be a local board of arbitration, one member appointed by the newspaper, another by the local union, and a third by the two already selected. An appeal to a national board was provided for. The latter was to consist of President Lynch of the International Union, and Mr. Driscoll of the American Newspaper Publishers' Association. If these two failed to agree, they were to select a disinterested umpire. A dispute over a wage-scale arose. The local union refused arbitration, but this was finally entered

upon after a ruling by the national board that the agreement was in force. The decision of the arbitration board was against the union, and an appeal was taken. The National Board could not agree, and Mr. Driscoll proposed the calling in of an umpire, as provided in the agreement. This was refused by President Lynch, on the extraordinary ground that the proceedings of the local board were irregular. He also declined to select an umpire to consider this question. The negotiations then failed, President Lynch leaving town. Yet the International Typographical Union expects to be "recognized" as a responsible organization!

The ease with which Sam Parks has detached the Portable and Safety Engineers from the arbitration agreement, speaks for his eloquence and personal force. Work on high buildings cannot be pursued without this union, and its defection from the new agreement is a notable victory for the walking delegate of the old Board of Building Trades. After this achievement, it was only natural that Parks should be the subject of eulogy at the Central Federated Union, and that Mr. Jerome should be attacked as a persecutor of organized labor. Of course, it is regrettable that a violent person awaiting sentence for assault, and trial for blackmail, should be hailed as a hero by an orderly and intelligent class of mechanics; but it is doubtful if there are many in the community who have the right to condemn this irrational hero-worship of the unions. To his constituents, Parks represents results and success—two deities to which we generally bow the knee. He has, by whatever questionable means, raised wages. How are the housesmiths or the engineers more blameworthy for supporting a barroom brawler than the church-going Republicans of Pennsylvania for upholding Matt Quay, or our trusted leaders in finance for accepting as one of themselves the latest highwayman who has had the stock market by the throat? Where broadcloth dearly loves a winner, why should overalls affect a superior virtue?

Nothing less than an arbitration treaty between France and England, in which Russia is subsequently to join, will satisfy Baron d'Estournelles de Constant. That eminent publicist has returned from the recent meeting at London, in which French and English parliamentarians took part, with the conviction that the time is ripe for negotiating such a treaty. Without taking what must be welcomed as a glorious dream too seriously, it must be admitted that the few outstanding differences between France and England are of a kind to be easily adjusted by arbitration. Except in the Hinterland of Morocco, along the western border of Anam, and on the "French coast" of Newfoundland, there is no real ground of friction between the two nations, and one may say that both are ready to settle these three remaining disputes in an amicable spirit. While it may thus be doubted if a formal arbitration treaty will seem necessary, it is wholly likely that the French and English will get the practical benefits of such a convention by direct negotiation. So it is only the imaginary adhesion of Russia to a triple alliance of peace which gives a Utopian character to the Baron d'Estournelles de Constant's inspiring project.

Not satisfied with a peace strength of 616,000 men formed into twenty-three army corps, the German military authorities are understood to be preparing to ask of the newly elected Reichstag a further increase of 351 officers and 8,400 men. They have the courage to do this in face of the refusal of the last Parliament to vote them 7,000 additional soldiers, and of the great increase in strength of the Social Democrat party, ever bitterly opposed to militarism in all its forms. The battle royal of the next session will unquestionably be fought over this issue, and many words like "traitor" and "little German" and "revolutionist" are doubtless in pickle for every member of the Reichstag who fails to give the War Lord the vote he asks. None the less, the Liberal press has already begun to protest against the proposed increase which is intended to strengthen the forces on the Russian frontier. Thus, the Königsberger *Handels-Zeitung*, while admitting that the increase may be needed from the military point of view, declares that the army must not be allowed to be the controlling factor in the Empire, and must be subordinated to its financial and industrial welfare. The Berlin *Tageblatt* is of the opinion that the Government will not dare to carry out its plan this year, particularly as it does not know just how much the rearmament of the light artillery is to cost. But who ever heard of a naval officer or of a soldier who believed his fleet or his army large enough, or who could refrain from appealing to Congress or Parliament for more men and ships?

With the resignation of the Hungarian Premier after a scant month of control, a very difficult position sinks into deeper confusion. The Governor of Croatia was called to Budapest in his capacity as a "strong man." He signalized his accession, however, by an attempt to defer all contentious measures for a period of several months. This left unsettled the status of Hungarians in the Imperial army, and the regulation of Austro-Hungarian fiscal relations under the Ausgleich. But it soon proved impossible to push the necessary supply bills through against the obstruction of the Independence party. To the threat that it would be necessary to go over the head of Parliament and govern by Imperial decree, the separatists replied that they preferred such absolutism to a régime that misrepresented them and failed to make head against Germanism in the army and schools. The incident displays strikingly the force of national sentiment in Hungary and the difficulty of maintaining the present federation with Austria. Premier Hedervary finds himself in a condition of complete discomfiture. He has promised more than his predecessor, M. de Szell, and now finds himself in the same *impasse*. There seems to be nothing left but the somewhat desperate expedient of dissolution and a general election.

The news from northern Turkey is characteristically vague and misleading, and yet certain novel features diversify a painful chronicle grown tedious through repetition. The Russian Consul at Monastir, like his predecessor, has been slain by a Turkish soldier. It is said that the assassination was provoked by M. Rostkovski's own arrogance, yet the incident shows how little the Turkish gendarmerie can be trusted in dealings with unbelievers. For some years past the Revolutionary Committee at Sofia has been promising a general outbreak. Now it asserts that the revolution has actually begun. The completion of the harvest has evidently permitted concentration of the bands, and their recent movements in the Okrida district have assumed rather a military than a guerilla aspect. Before this peril the somewhat hollow scheme of reform recently imposed upon the Porte has broken down. Turkish regulars are being hurried towards the Bulgarian border, and the dispatches tell already of bloody reprisals executed upon Christian villages. As to the future, the real factors in the situation are these: the bandit-patriots of Boris Sarafof, who seek to provoke the Turks to outrage and bring about such massacre in northern Turkey that Christian Europe will be forced to intervene; the Turkish Empire, strong enough to put down the revolt with a bloody hand, but little able to restrain the warring clans on the spot or its own savage soldiery; the Austro-Russian compact for the Balkans, which desires to maintain the *status quo* and is unwilling to attempt to cut out a new tier of Christian states south of Servia and Bulgaria. The revolutionaries are making any settlement of the Macedonian question by Turkey impossible. They cannot be treated, as perplexed Mr. Balfour seems to wish they could, as bad boys in need of a birching; they can sooner or later force European intervention.

THE PRESIDENT ON LYNCHING.

President Roosevelt has been stirred by the lynching epidemic to a wise exercise of his "right of speaking to the nation." In that phrase Mr. Bryce happily expresses one of the unenumerated Presidential powers. Besides his designated function of informing Congress of the state of the Union, the President has an inherent duty as the elect of the people to address the people direct when a national folly or peril furnishes the occasion. In speaking out as he has now done, Mr. Roosevelt has acted Lincoln-fashion. Often, during the civil war, there came from the White House an open letter, filled with the "brave old wisdom of sincerity." The famous letters of Lincoln to Horace Greeley, and to Erastus Corning *in re* Vallandigham, remind us of the effective use then made of this weapon of straightforward speech to the country. It is an excellent precedent, therefore, which the President has followed; and every one must see that his word, uttered at the psychological moment, will have a much wider reverberation and effect than could possibly have attended a mere paragraph in a Presidential message. Mr. McKinley tried the latter method, but his words fell at once by the wayside.

The letter to Governor Durbin is related to the President's duty in another way. He is the guardian of our foreign relations. Our lynching ferocities have more than once involved us unpleasantly with other nations. Italy and Austria and China have made their protests, and forced us to acknowledge the shame of our wild lawlessness. Such diplomatic situations may recur at any moment if lynching be not stamped out. The infuriated mob is no respecter of nationalities. A foreign subject is as ready material for slaughter as a black man enjoying the immunities of an American citizen. Thus the President is only displaying prudence as the head of the nation when he warns us against enormities that might so easily run into assaults upon foreigners resident here. This is to say nothing of our moral impeachment by the judgment of the civilized world. The President refers to this when he says that the prevalence of lynching in the United States disables us from speaking up in the old way against wrongs and cruelties in other lands.

As regards the matter itself of the President's letter, there is little in it that we cannot heartily commend. If he appears to protest too repeatedly that he has no sympathy with the crimes which rouse the mad passions of the lyncher, it must be remembered that he had to guard himself against misrepresentation. Leaders of the mob would have been ready to join with the Miss Nancys of the namby-pamby press in declaring that Mr. Roosevelt forgot the awful criminal, had he not been at pains to prove that he did not. That he should have anything particularly new to say, was not to be expected. The whole thing is a matter of elementary morals and of rudimentary civilization, and the arguments have all been stated many times. But the President's public service is none the less great. He has made it clear that his nature starts back in horror, as does that of every sane American, at the bloody and shameful spectacle of lynching. He sees in it, as Emerson saw in all action by the mob, "man voluntarily descending to the nature of the beast." And his words of honest indignation and of wholesome warning will carry through the land as could those of no other man. The President occupies a pulpit commanding more hearers than that of any other preacher of righteousness in this country. He made no mistake when he mounted it to deliver this earnest and urgent message to his countrymen. After thus fearlessly freeing his own mind, he may with a better grace call upon every teacher and editor and clergyman in the United States to make their voices heard against the onset of anarchy.

"He can never again be the same man," writes the President impressively, of any one who has ever taken part in a lynching. Merely to have seen the hideous sight implies "degradation," he adds, and points out that the wrong done by the mob to the community is even greater than that done to its individual victims. We think that, if a severe logician were to apply the doctrine rigorously to the actions of this nation since 1898, he might find reason for saying that we have done lawless and cruel things to an "inferior" race which make it impossible for us ever to be the same nation again. We are firmly of the belief that the wholesale contempt for the rights of "niggers" in the Philippines, of which this Government has been guilty, has had a great deal to do with the outbreak of savagery against the colored man in this country. But we will not stop over this to-day. Mr. Roosevelt has boldly put his finger on the real motive of lynching. It is born in race prejudice and race hatred. It lays more emphasis upon the color of the criminal than upon his crime. Its prime assumption is that the negro is, as such, beyond the protection of the law. Therefore, the first duty of all who would set their faces against the torrent of lynching which threatens to sweep us away, is to fight race discrimination in all of its manifestations. That is the only way to make those bitter waters sweet at the fountain. By seeing and saying this, and by standing up so manfully for the inviolability of justice and the supremacy of the law, President Roosevelt has put us all in his debt. From his letter to Governor Durbin there might well date a new patriotic and civilizing impulse, leading honest men everywhere to unite, in word and deed, and with every instrument of persuasion and of power, to put down those lawless bands that are to-day our greatest national danger as they are our deepest disgrace.

THE PASSING OF THE COMMANDING GENERAL.

Far more interest attaches to the retirement, last Saturday, of Nelson A. Miles, for eight years commanding general of the army of the United States, than ordinarily to a change of army commanders. It is not merely the disappearance from the active list of an officer who has for decades figured prominently in the public prints. It practically marks also the passing of a high office first bestowed upon George Washington in 1798, upon what seemed to be the eve of war with France. Gen. S. B. M. Young, it is true, is to succeed to the title of Commanding General, but only for a week, when he becomes the first of what is doubtless to be a long line of "Chiefs of Staff." The event denotes as radical a change in army methods as any occurrence in our army's history.

With this reform Gen. Miles has never had any sympathy, despite his familiarity with European armies. He has perhaps failed to realize that the principle is correct, however dangerous the faults which it may have revealed in practice, as in the French army. In this and similar aversions to new-fangled military notions, Gen. Miles has been merely one of a number of civil-war veterans who could never be brought to see that the methods of 1865 were not those of 1885, and much less those of 1898. The future historian who reviews Gen. Miles's activity as the head of the service will doubtless find in this attitude the reason for his frequent failure to rise to the possibilities of his high office. He will look in vain for any stirring utterance against favoritism within the army, and will find few if any searching reforms due to Gen. Miles's advocacy.

If the historian then turn to this officer's purely military services he will find much to praise. Col. Miles of the Sixty-first New York Infantry was a gallant figure on the firing line at Fredericksburg on December 11, 1862, even though he was denied permission to lead one more desperate rush against the enemy's breastworks. At Chancellorsville he held, until wounded, a line of abattis and riflepits against a strong force of the enemy with such "distinguished gallantry" that the medal of honor was readily bestowed upon him. At Spottsylvania he bravely led his brigade into the renowned "Bloody Angle." In four years this Boston clerk of twenty-one years rose from a captaincy to a major-generalcy and the command of a division of the Army of the Potomac,

participating in all of that army's battles save one, which he missed because of one of his four wounds. In the West after the war his name became a household word because of his successful campaigns against Chief Joseph, and the Bannock Indians, and the Geronimo Apaches, during which he received the thanks of five States and Territories as voted by their Legislatures.

With his services in the Pine Ridge campaign, in the Chicago strikes of 1894, and in the war with Spain, our readers are familiar. Whatever judgment may be passed upon them in the future, and however much they have been marred by several instances of insubordination and a total inability to get on with his civilian superiors, the fact remains that Gen. Miles has frequently incurred the dislike of those in power because of his desire to serve his country well. As to this it suffices to cite the "embalmed beef" inquiry of 1899, and his recent bold criticism of the army for its ghastly cruelties in the Philippines. For daring to speak out as he did in this matter Gen. Miles deserved the thanks of Legislatures quite as much as for his successful campaigns.

It must not be overlooked, however, that Gen. Miles was, like many of his predecessors, to a large extent the victim of his office. Grant, Sherman, and Sheridan were nearly as uncomfortable in their relations to their Secretaries and Presidents. Even when Grant the soldier became Grant the President, there was no change for the better. Sherman moved the headquarters of the army to St. Louis in despair. Not until Mr. Elihu Root became Secretary of War was the source of the trouble clearly recognized. The position of "commanding general" was, in reality, merely titular. Its incumbent, while able to exercise a little influence over the line of the army, never had the slightest control over the ten heads of staff departments, long supreme in their influential spheres, who paid as little attention to the "Commanding General" as they did to each other, save to issue orders in his name—often without his knowledge. The staff has thus been virtually paramount, to its own injury as well as to that of the army, as was clearly demonstrated in 1898.

To remedy the state of affairs then revealed, there has been created a General Staff, presided over by a Chief of Staff, who need not be the senior general of the army, thus leaving the President free to choose his own chief, particularly as the office is to be held for four years only—not until retirement. The new order makes the Chief of Staff and all his officers agents of the Secretary of War, general officers, and other superior commanders, in coördinating the action of all the officers under the supervision of the Chief of Staff. Unlike the Commanding General, the Chief of Staff is the "supervisor" of the staff departments as well as of the line. While the detailed regulations for the new Staff, which comes into being next Saturday, have not yet been promulgated, it is evident that they will thus absorb many of the functions of the present adjutants-general and inspectors-general.

As a matter of fact, Gen. Corbin, by virtue of his undoubted abilities and friendly relations with Mr. Root, has been practically a chief of staff ever since 1898. Many of his powers and duties will now be assumed by Gen. Young, who will also have to face all the difficulties certain to be encountered by an intermediary between the Secretary of War and the chiefs of bureaus, who are already jealously eyeing the new official to whom they owe obedience. It is expected that all departmental and staff matters will go to the Secretary through the Chief of Staff, who will also supervise the instruction of officers and troops, the accumulation of military information, the War College, and the service schools, the planning of campaigns, etc. —all this regardless of whether the Chief of Staff is the lieutenant-general or not. In other words, in place of a long outgrown and outworn office there is created an officer who is a link between the Secretary and every branch of the service, and who can be held *responsible* for its efficiency. This was never the case with the Commanding General. In place of what was a mere sham there is now an office of dignity, power, and responsibility, full of opportunity for valuable service, in keeping with the best military traditions, and quite worthy of a Washington, a Scott, a Grant, a Sherman, or a Sheridan.

To end where we began, with Gen. Miles, we must add that the failure of Secretary Root to issue the usual complimentary special order upon his retirement has been, with justice, widely and severely criticised. It is an unheard-of slight, and one utterly unworthy of a Cabinet officer who has shown himself in many respects the ablest of our War Secretaries. It is also a serious reflection upon the President, if he lent his sanction to anything so petty and so unworthy. Gen. Miles at one time and another has caused the Administration great vexation. There was a period in the spring of 1902 when his forcible retirement seemed inevitable in the interests of peace and the discipline of the army. We have reason to believe that Mr. Root at that time used his influence to establish a *modus vivendi* which would save Gen. Miles from the humiliation inseparable from a forced retirement. It was Mr. Root, too, who had the date of the beginning of the General Staff set for a week after Gen. Miles's retirement, so that he should not be forced into connection with a body to which he was utterly opposed. In view of these magnanimous acts, the failure to give Gen. Miles his retiring order is incomprehensible. These documents are stilted and formal at best—merely a review of the officer's long service, his wounds, medals, etc. Mr. Root could have added to this the praise due to Gen. Miles's civil-war record, and then dropped the veil over the recent past. But he has chosen otherwise and not well.

OUR "COMMISSION OF EXCHANGE."

Occasional dispatches have kept the public informed of the travels of our "Commission of Exchange" to the various capitals of Europe, but none of them have told us the nature of their communications to the courts with which they have conferred. A general impression has gained currency that, whatever their suggestions were, they were unfavorably received at London, Paris, The Hague, and Berlin. According to a Berlin dispatch to the London *Times*, however, the mission has secured at least an academic assent to the proposal that the currency of the countries which still maintain the silver standard, shall be regulated according to the system adopted by British India in the year 1893. That system was the discontinuance of the coinage of silver for private persons —in other words, the demonetization of that metal, and its coinage for Government account only. The purpose was to reach the gold standard at some future period. In the meantime the Government agreed to give silver rupees in exchange for gold at the rate of 16d. per rupee, and to receive gold for taxes at the same rate; but no promise was made to give gold for rupees at any rate whatsoever. No such promise has yet been made, but the Government now gives gold for rupees at that rate, or at the current rate of exchange on London, which oscillates around 16d. within narrow limits. The status of the rupee is much the same as that of our silver dollar. Both Governments promise to redeem their legal-tender silver in taxes, and this kind of redemption suffices for the present to maintain parity. Whether it would suffice under all conditions of trade and industry, is uncertain.

Now it does not advance matters for us to secure the assent of any number of countries to the currency system of British India. We have already passed beyond that stage in our Philippine legislation. We have adopted for the islands a silver coinage of full legal tender, plus a subsidiary coinage of limited tender, both to be coined, issued, and redeemed in gold by the Government. This is an experiment involving needless expense and of very doubtful utility. It could never have passed Congress but for a Quixotic attempt on our part to help Mexico in her financial muddle, and at the same time to "do something for silver." The "Commission of Exchange" is the outcome of the latter proposition.

At the instance of a Silver Senator it was engrafted on an appropriation bill in an attenuated form, after it had been rejected by the House in its original shape. The question of immediate pertinence, however, is: How will it help us, or the Filipinos, if we secure the assent of other nations to the financial policy of British India? Great Britain gave her consent to it in 1893, and is not likely to withdraw it. We have no need to ask her cooperation in doing what she has already done. If Mexico desires to follow the example of British India, the way is open for her to do so. It is not necessary for her to ask the permission of Emperor William or of Czar Nicholas. Equally needless is it for us to introduce her envoys to the Imperial presence for that purpose.

If our "Commission of Exchange" has had the purpose at any time to ask foreign Governments to enter into a joint agreement with us to maintain parity between gold and silver at some ratio, that would be an attempt to accomplish what the three international monetary conferences of the last century failed to do, or even to attempt. The difficulty would be much greater now, since China would be the chief factor in the agreement, her silver currency being greater in volume than that of Mexico, the Philippines, the Straits Settlements and Tonquin added together. Who is to underwrite any agreements made by the Empress Dowäger, or any other potentate of the Celestial Empire, respecting coinage or anything else? But it is not necessary to go to Eastern Asia to find an example of the regulation of the monetary systems of nations by mutual agreement. The history of the Latin Monetary Union stands out as a perpetual warning against such experiments. Not one of the countries in that Union could be induced to enter it now, if they were well out of it; and France least of all. And what is the likelihood that we, the United States of America, would enter into an agreement with Mexico, China, or any other country to guarantee the parity of gold coins and silver coins at any ratio or at any number of ratios? The idea is preposterous. Not to examine the financial consequences, which are not easy of apprehension to the mass of mankind, let us ask what would be the effect upon our political parties. If such a treaty were brought forward by the present Administration, Mr. Bryan would immediately claim it as an endorsement of his policy by President Roosevelt, and Democrats would naturally favor the ratification of the treaty as being in general harmony with the Kansas City platform. The Republicans for the same reason would oppose it, and this issue might overshadow everything else in the next national election.

We need not pursue this matter further until we learn exactly what plan, if any, our "Commission of Exchange" has proposed to foreign governments. It may turn out that they have proposed none.

THE HOME MARKET CLUB AT SEA.

There has fallen into our hands a "circular of inquiry" sent out by our old friend, the Home Market Club of Boston. Being addressed only to "Governors, Presidents of Colleges, Railroads, and Banks, and principal Merchants and Manufacturers," it naturally did not come direct to this humble office. We owe sight of it to a Western business house, who pass it on as a curiosity. Such it must seem when we say that the circular reveals the Home Market Club putting out to sea. It is a spectacle to excite, if not "moaning at the bar," at least hilarity on shore.

What we have is a Club which is on record against all wicked imports from abroad, now working itself into a patriotic fever over what ships shall bring them in. It is, in other words, the "recovery of our carrying trade" to which the Home Market Club devotes its latest "canvass." It wants its distinguished correspondents to tell it how the thing is to be done, and puts to them the following questions (note the ingenious way in which a horrible alternative is brought in at the end):

> Is it your best judgment,
> First, that Constitutional means—that is to say, discriminating duties and other regulations of commerce—should be used?
> or
> Second, that a subsidy system should be applied?
> or
> Third, that nothing should be done, and that foreign nations shall be allowed to continue to appropriate our commerce and navigation, as it may please themselves or as chance may determine?

The Club's own preference is not left in doubt. Subsidies it dismisses as possibly "not warranted by the Constitution," and, in the light of "the recent attempts of Congress to enact a subsidy system," as open to "grave objections," and "inexpedient." Inexpedient, by the way, is a clever word for impossible. But the plan of laying discriminating duties on all goods not imported in American bottoms is just the kind of thing to be liked by an organization which likes what the Home Market Club does. It is Constitutional; it goes straight to the point; and, best of all, it would increase the tariff by 10 per cent. on all imports carried by foreign vessels. There are, to be sure, slight objections, such as treaty obligations; but the treaties can be "denounced." The measure would, of course, make ducks and drakes of our foreign trade, and set the hand of every mercantile nation against us; but those considerations have no weight with a Club whose only excuse for being is undying hostility to foreign trade.

It is, indeed, only the sure instinct of the Home Market Club for taking up lost causes that makes its advocacy of discriminating duties in favor of American shipping worth comment. That wild notion has had a few scattering champions; Senator Elkins regularly introduces a bill to put it into effect, and it is as regularly heard of no more. But its implications and affiliations are never so conclusively shown as when it is urged by the Home Market Club. That gives it the proper stamp. We see at once that it must be a benighted measure to commend itself in that quarter. For the shibboleth, "The home market for the home producer," besides having fallacies lurking in every word, carries one back to an almost prehistoric conception, so ignorant and uncivilized is it. In Sir Henry Maine's work on 'Village Communities,' he gives us a picture of that primitive absurdity, the home market. Each community aimed to be complete in itself, so as to be able to "continue their collective life without assistance from any person or body external to them." There was the true home market for the home producer in India, and what utter stagnation it meant we know. The idea persisted, of course, to modern times. Even as late as the first Napoleon, his financial adviser Mollien had to fight the foolish old superstitions about foreign trade which have been reincarnated in the Home Market Club. People thought, said Mollien, in words that seem as if written for the latitude of Boston to-day, "that the most important thing for our nation was that not one sou should ever leave France"; that taxation, wages, and the progress of the industrial arts did not matter in the least "provided always that one Frenchman gained what another Frenchman lost." There is the Home Market doctrine to the life; and one instantly sees how a Club professing such obsolete beliefs should be enamored of the almost equally obsolete idea of taxing every foreign steamer that insults us by bringing back the price, in goods, of what we have sold abroad.

But are we not patriotic? Would it not warm our hearts to see the flag of American merchantmen gladdening every sea? Assuredly; and there are shorter and more certain ways of bringing that about than are dreamed of in the Home Market Club's philosophy. Instead of reviving the antiquated discriminating tax, let us get rid of that other antiquated method which still torments us—our navigation laws. England found hers a big blunder, and repealed them; but we, having copied them, cling to them, though they are the ruin of our carrying trade. If the example of the steamers *Paris* and *New York* were extended, and Americans allowed freely to fly their own flag over their property, there would be little complaint about our ships being driven from the ocean. One thing is certain. If we are to become a great trading nation, taking toll and getting rich from "the

great commerce," we must escape from the caverns where the Home Market Club dwells among its owls and bats of yesterday.

THE ANGLO-GERMAN TARIFF SQUABBLE.

Mr. Chamberlain's scheme for Imperial reciprocity is supported mostly by such unassailable generalities as saving the Empire and retrieving the half lost colonies. Naturally, the Liberals and Unionist free traders find it hard to meet a propaganda which rests, not upon evidence, but upon despair. You cannot argue *de gustibus* in Parliament even when the predilection you are opposing is an obsession of national disaster. But the Chamberlainites and the "inquirers" have fortunately committed themselves to one concrete argument for Imperial protectionism—the case of Canada suffering under German tariff discrimination; and Canada "penalized" by Germany for granting a customs preferential to the mother country has many times served as Mr. Chamberlain's horrible example of the inconveniences of free trade. All the Ministry have echoed the Canadian theme; the Duke of Devonshire, Lord Cranborne, and others have shaken their heads over it; on this account the suave Mr. Balfour promulgated his doctrine of "negotiation by retaliation," while Mr. Brodrick demanded metaphorically "a revolver" to draw on all protectionist bullies—meaning Germany.

As to the German-Canadian tariff controversy we are not left to conjecture. The whole correspondence in the case has recently been published, and Mr. Asquith, in the House of Commons, has completely punctured the effigy of an indignant Ministerial Perseus descending to the rescue of a helpless Colonial Andromeda. The mere facts in the case, which Mr. Asquith displayed chronologically, brought Mr. Chamberlain to confusion, and showed the hollowness of his fuss and fury at Baron von Richthofen's hint of tariff discrimination made last May. The facts in brief are these: Canada, desiring, in 1898, to give the mother country a tariff preference of 25 per cent. (subsequently increased to 33 1-3 per cent.), found herself bound by treaties, among them that of 1865 with Germany, to give most-favored-nation treatment to a number of countries. This would have prevented the granting of the preferential to England. Accordingly, treaties to the contrary were denounced. That is, Canada voluntarily forfeited all treaty privileges, in Germany and elsewhere, coming automatically under the highest tariff in each case. This forfeiture was not a penalty, but was, as Baron von Richthofen shows, "necessitated by German law." To complain of it was obviously to ask Germany to nullify the treaty so far as it had been advantageous for herself, but to keep it alive so far as it might be advantageous to Canada. Canada, nevertheless, protested to Mr. Chamberlain, and received the significant reply that the remedy was in her own hands. Taking the hint, Canada, last April, imposed a retaliatory surtax on all German imports. The tariff duel was and remains an egregious folly, but it was conducted according to the code, and nobody could properly complain. Even the Canadian Minister of Finance, Mr. Fielding, admitted that it was a natural result of Canada's coming into the class of "non-treaty" countries.

The quarrel has continued through attempts at mystification on either side. Mr. Chamberlain and his faction have disingenuously held that tariff arrangements within the British Empire were domestic transactions with which foreign nations were not concerned. That was to act upon the theory that Mr. Chamberlain's dream of Imperial Federation is a present reality, and it was to require Germany, when she found her chief commercial rival favored in the Canadian market, to accept the situation amicably out of love for the British Imperial bond. Naturally Germany refused to dilute her schedules because British blood is thicker than water, but her spokesman unluckily committed indiscretions as glaring as Mr. Chamberlain's sophisms, by suggesting that Germany should retaliate against Canada in the person of the mother country. Since the old commercial treaty had been denounced by Great Britain, Germany had the technical right to apply any tariff schedule she chose to British imports. Yet when Baron von Richthofen made the suggestion of taking England off the most-favored-nation list, in a diplomatic note of April last, it was justly resented. For, first, the proposal was ungenerous and inexpedient (since England gives free entry to most German products), and second, it was palpably a bluff of an offensive kind. This the German Foreign Minister virtually admitted when, later, he apologetically described the proposal as "academic."'

But this *faux pas* came very opportunely for Mr. Chamberlain. Three years earlier, Baron von Richthofen had made the same offensive suggestion in the Reichstag, and, as Mr. Asquith cruelly reminded the Colonial Secretary, "the Government took it lying down." The Boer war found Joseph sober; three years later the same offence finds Joseph with a reciprocity campaign to launch, frantically seeking a weapon of retaliation, though he pay for it with the fiscal stability of the Empire, and grasping eagerly at a *casus belli* previously quite ignored.

We have gone into the German-Canadian matter somewhat in detail because it illustrates what must happen in every protectionist Colony of England before Mr. Chamberlain's plan can be put in effect. He is lashing every colony on to similar warfare, which apparently must upset every colonial budget, shake the basis of British manufacturing, and violently alter the channels of British trade. But, looking again at Canada from within, it is clear that the practical establishment of a British reciprocity convention is fraught with difficulties that would stagger those who shout wildly for a united Empire. Mr. Fielding has served notice "that we could not undertake to give that [Mr. Chamberlain's] preference in a manner which would operate to the disadvantage of our own industries." That means, in a concrete case, that Canada cannot on the one hand pay bounties to the iron and lead foundries, and on the other encourage the British metal industries to compete in a market thus artificially sustained. Far more valuable to Canada is the opportunity to send over to us her field, forest, and pasture products. It is this hope of facilitating her most promising trade that keeps official Canada notably cool towards further adventures in tariff warfare. Yet a certain crude nationalism which rejoices at, rather than regrets, the German imbroglio, is making itself felt. Sir Wilfrid Laurier may not be returned, and for many years there may be no such favorable opportunity for obtaining a reciprocity treaty with Canada. Its advantages once experienced, the Dominion would probably seek the ways of commercial peace. Every good citizen on both sides the border should urge that the matter receive the earnest consideration of the dormant Joint High Commission. And especially Americans should support the activities of the National Reciprocity League. For if Mr. Chamberlain's designs are little to be feared, Canadian aggressiveness and American indifference might quite as disastrously thwart a consummation dictated by all considerations of amity and mutual commercial profit.

TAINE AND HIS STATUE.

Posthumous recognition of great men ordinarily presents few difficulties. For even a prophet whom they do not like, men are usually willing to build a tomb when they are once assured that he is "thoroughly dead," as Motley horrified the Londoners by saying that he hoped Stonewall Jackson was. The common trouble is the failure of the world to know its own leaders of thought while they are alive. Even Dryden found a Minister to make him a grant—after he was dead. As Pope wrote satirically of this tardy rescuer:

"He helped to bury whom he helped to starve."

This general tendency of death to extinguish envy even in the matter of commemorative statues makes the contemporary agitation in France over the project thus to honor Taine, ten years after

his decease, all the more puzzling. The municipal councillors of Vouziers took the initiative in erecting a monument to their illustrious fellow-citizen, formed a committee of honor, and invited "adhesions" and subscriptions. Strangely enough, they encountered violent opposition in a quarter where it could least have been expected. Catholics objected to a public statue to Renan, and no wonder; but it is the Radicals, anxious to make themselves appear even more intolerant, who are made angry by the proposed tribute to Taine.

Their leading and most respectable spokesman is M. Aulard, a professor at the Sorbonne, himself a distinguished historian from whom large views and generous sentiments might well have been anticipated. He alleges a certain malign political significance in the proposed monument to Taine, finding, he says, a suspicious number of members of the "Patrie Française" in the list of adherents. But that is not his main grievance. He declares Taine unworthy of a public statue because, in his 'Origines de la France Contemporaine,' he "attacked the Revolution." It would, therefore, writes Professor Aulard, be wholly natural for Conservatives or Nationalists to "glorify the writer who so powerfully aided them in combating the republican spirit. . . . To bourgeois fears, to reactionary hates, he furnished so-called historic arguments." If, then; there is to be a statue to Taine at all, argues M. Aulard, "let it be subscribed for by the Conservatives, and above all by the Catholic Church."

Taine, of course, was, nominally at least, a Protestant. His funeral services were conducted by a Protestant clergyman. It would appear, however, that he had no strong religious prepossessions, any more than he had binding party affiliation. He wrote what he thought; was the professed servant of the truth as he found it, and of science as he understood it, not caring to flatter and not fearing to offend. To an outsider, the wonder is that his sheer intellectual distinction, the vast range of his attainments, and his extraordinary literary charm should not of themselves have been enough to still these partisan rancors, and cause France, in all her parties, to join without question in honoring one of her most famous sons. When one undertakes to characterize the mental greatness of the France of twenty years ago, the name of Taine leaps as inevitably to the lips as that of Renan or Pasteur.

If Taine "attacked the Revolution," he did so by throwing an extraordinary amount of new light upon it. The best historians, we believe, question his judgments upon some of its leading phenomena, but all of them agree about the importance of the new material he unearthed, and the fascinating way in which he treated it. It was a scientific method which Taine early espoused and long illustrated in his historical writings. He explained and enforced it in the Introduction to his 'History of English Literature.' It was, in a word, the realistic and literary treatment of history. In his own language, historians should seek, not an abstract result, but

> "the complete thing, the man in action, the bodily and visible man who eats, walks, fights, works. Put one side your theory and mechanism of constitutions as of religions, and endeavor to see men in their shops, their offices and fields, with their sky, their soil, their houses, dress, education, food, just as you do when, landing in England or in Italy, you scrutinize faces and gestures, streets, and inns, the city man on his promenade, and the workingman at his cups."

With this fixed glance upon the man behind the document, Taine was ready, as he wrote, to "give fifty volumes of charters and a hundred volumes of diplomatic documents for the memoirs of Cellini, the letters of St. Paul, the table-talk of Luther, or the comedies of Aristophanes." This explains not only his point of view, but his freshness, his infallible eye for the significant and picturesque detail. If to apply such a method as his to the French Revolution is to "attack" it, and to prove him undeserving of recognition by his countrymen, then the Revolution must have sunk to the level of a superstition or a fetish, and candor, tireless industry, and splendid literary gifts ceased to be a title to fame.

SOME FEATURES OF THE WEST COAST OF MEXICO.

MEXICO, 1903.

The west coast of Mexico is naturally divided into two very distinct regions between the Arizona border and the Isthmus of Tehuantepec, a northern strip of coastal plain, and a southern zone of rugged mountainous country. The Sierra Madre extends from the north in a south-southeasterly direction into the State of Jalisco to about latitude 21° north, while the coastline bears more sharply to the eastward, narrowing the distance between the sea and the mountains to less than forty miles in the vicinity of Mazatlan. A considerable depression extends across into the central plateau of Mexico on a line from the port of San Blas to Guadalajara, in Jalisco, and below this an entirely distinct chain of mountains strikes east-southeast, traversing the States of Jalisco, Michoacan, Mexico, Morelos, and Puebla, to the confines of Vera Cruz. The great area between this range and the Pacific Ocean, including the States of Guerrero and Oaxaca, is broken by innumerable mountains, forming an intricate network of ranges, where volcanic activity in the past has been enormous. Vulcanism ceased here long ago, and the region has become seamed with metalliferous veins in almost every part. The indications are that it may become one of the greatest centres of mining in Mexico. The more distinct range from Jalisco to Vera Cruz is still a geologic line of weakness, notably subject to earthquakes and occasional volcanic outbursts, the most recent of which has been at the volcano of Colima, whose pranks are still a matter of interest, and afford some reason for local alarm.

The Sierra Madre, however, has settled down to a reposeful old age, and guards a coastal plain of great fertility, which is rapidly assuming importance in the production of sugar. This plain is practically embraced within the States of Sonora and Sinaloa, the more favored zone lying within the latter State. It is somewhat of a misnomer to call this a coastal plain, since it does not represent a seaward growth of the mainland resulting from the denudation of the mountain masses behind it. The valleys are broad, and widen toward the sea, but the country is mostly broken, and intersected by ranges of hills rising at times to a height of more than a thousand feet. The soil is generally thin in the uplands, the original rock lying only a few feet below the surface. This consists of ancient volcanic rocks, and altered sandstones and conglomerates. The volcanic rocks are profoundly altered, so that their original character is nearly effaced, and everywhere they are seamed with calcite and brilliant zeolites of many different species. Scarcely can an excavation be made in them anywhere without revealing these beautiful minerals with dainty stellate forms. The oxidation of the iron pyrites has also given to the rocks in places a yellowish tinge, in others reddish, producing every gradation from dark lavender to brick-red tints. The altered sandstones and conglomerates are similarly colored, so that above the brown bottom lands are constantly appearing broad slopes and furrowed hills where the rock lines are exposed, giving a characteristic warmth of color to the landscape. The higher hills consist of siliceous eruptive rocks, white or creamy in color, sometimes solitary towers, the necks of old volcanoes, or else forming escarpments of great length, where huge dikes had been thrust up from below. These bleached and barren walls of rhyolite, peering through the forest growth that climbs up their sloping bases and mounts into every breach which time has made in them, often assume a picturesque resemblance to ruined architecture.

Along two well-marked lines between the coast and the high mountains are found remains of the sandstones and conglomerates which formerly extended over this region, only slightly changed in character, but tilted in every direction. These, taken in connection with the great areas of volcanic rocks between, give a profound impression of the mighty forces which have been operative here, the vastness of the volcanic action, and the equally mighty effects of denudation which have quietly reduced what must have been important mountains to the condition of hills and rolling plains. The evidence is very strong that there once existed here a great coast range, lifted up so long before the Sierra Madre that its rivers had cut back through them into the continental plains, ready to drain the newer mountains directly to the Pacific along east and west lines, as soon as this new belt of orogenic movements was established, for it is a conspicuous feature of the region that no north and south valleys exist between these older mountains and the Sierra Madre. An apparent exception is the valley of the Humaya, whose river ultimately joins the Tamazula at Culiacan, forming the Culiacan River. The great western barrier of this valley, a range of

rhyolitic rocks rising to an altitude of over five thousand feet, was manifestly connected in its origin with the uplifting of the Sierra Madre, occupying the line of a huge rent through the conglomerates, which are found on both sides of the range. It is further remarkable in that it presents a rather rare example of sudden upheaval on a large scale in the Sierra Madre region, abruptly changing the old established drainage lines, which elsewhere have persisted, so that as a rule the Pacific waters rise on the eastern side of the continental backbone.

When one comes to the Sierra Madre, wonder ceases that a great coast range could have been worn away so that only vestiges of it remain to-day. The climate of western Mexico possesses destructive capabilities exceeding those of the frosty North. Such wrinkled slopes exist nowhere else in all the Americas. The fierce heat of the long dry season from March until the end of June draws every particle of moisture from the rocks to great distances from the surface, and expands them until the cohesion of the particles is overcome. Then follow torrential rains from July to October, carving deeply into these loosened masses, and sweeping the rock faces clean. Nature furthermore has endowed a curious vegetation with power to thrive under these extremes of moisture and drought, and the rugged, shrubby growth clings to the mountain sides, thrusting its roots deep into every crevice and parting-plane, rending the rocks asunder. Immense blocks of diorites, felsites, andesites may be seen at every turn split into countless pieces by the roots of single trees, held together by the roots of these same trees until they relax their grip in death and decay, when often a hundred tons of débris will shatter down from where some amapa, or copal, or tepehuaje tree had struggled for half a century to maintain its life.

The constant and uniform decay and erosion of the mountains has trimmed them all to the angle of rest, and this angle is steepened by the binding power of vegetation, so that the whole front of the Sierra Madre presents a complex of precipitous ridges. The roads accordingly follow the arroyos and the combs of the ridges as far as practicable. One can ride horseback at many places for miles along these narrow backbones, climbing by comparatively easy stages to such heights that these inaccessible slopes may be seen plunging sheer, on either side of a ten-foot roadway, to depths of one, two or three thousand feet. Where the roads zigzag up the mountain sides, or climb over some break or depression, it is common to see them washed out by the summer rains until they are like little twisted cañons, with walls twenty to thirty feet high, and barely wide enough for the horses' hoofs in the bottom. These break-neck slopes have enough thin soil gathered about the roots of the trees to produce one or two crops of corn, and the natives will laboriously clean what seems to be nothing more than the side wall of a mountain, fence it around with brush to keep out the cows, which in this country appear to develop scansorial faculties equalling those of a goat, patiently weed it, not once, but twice and even thrice, and finally gather a scanty harvest, which they then have to share with their invincible enemies, the rats and the weevils. This system of cultivation is an inheritance from the aborigines (here indiscriminately termed Aztecs in common speech), whence it happens that very little original woodland, or *monte*, exists in the vicinity of the rivers or permanent water holes where human habitations can be built. Thus the native has become a powerful factor in aiding the rapid denudation of these mountains, for where he once cuts the brush to make a *milpa*, the wash starts a series of new gullies that ere long lengthen into a gash which another generation will rightly call an *arroyito*. A level spot is rare, and where one exists it is sure to be inhabited by some mountaineer; and if it is big enough for a cluster of wattle huts (*jacales*), and a beanfield or two, it is called a *mesa;* and if very close to the water, very level and fertile, one will hear the suggestive old Spanish name of *vega*. These are oases, the very mention of which sounds musical to the worn traveller.

Such is the western edge of that great plateau known as the Sierra Madre. Farther north, in Chihuahua, the plateau has been graven into a complex of lofty mountains, but here in western Durango, along the Sinaloa border, it is only the edge of the plateau that is worn into ridge and pinnacle. Moreover, it would seem as if this had been the scene of more active vulcanism, where remnants of ancient volcanoes cluster along lines of gigantic outbursts which remain to-day as mountain-forming dikes. This zone is only from ten to thirty miles in width, beyond which comes the elevated tableland where one would scarcely suspect he was in a mountain region. The series of tertiary eruptive rocks is beautifully revealed in this western part of the Sierra Madre, where the anatomy of the mountains is exposed by erosion. The original core of the range was mostly a hard gray diorite, succeeded by intrusions of a less siliceous grano-diorite, in which are often seen included masses of the older diorite from a foot in diameter to blocks having a larger dimension of even forty feet. Through this mass of crystalline rocks were intruded vast dikes of rhyolite and trachyte, followed by very basic dark andesites and traps. The absence of mica is most striking. In the whole valley of the Humaya it is impossible to find a single scale of it, although it is fairly abundant in the valley of the Tamazula farther south. Faulting of the rocks since the latest volcanic eruptions has proceeded on a large scale, and is continuing to-day, as a result of the combined action of the chemical processes altering the rocks, and of the excessive denudation leaving the mountain masses unsupported by a sufficient width of base in proportion to their height. There is probably no better district in the world for the study of such phenomena.

The vegetation of the west coast is extremely varied. Cacti of many kinds abound, sometimes making veritable forests, and growing to heights of more than twenty feet. The *tuna*, the national plant of Mexico, is also universal, but not as magnificent in its development as in the central plateau. Many smaller forms exist, spiteful little balls of bristling spines which dispute the way through the woods and over the rocks. A stunted growth spreads uniformly from the sea high up into the mountains, forming almost impenetrable thickets. The *palo blanco* is conspicuous by its yellowish gray bark and petunia-like white flowers. The *pochote*, or silk-cotton tree, is also noticeable, not alone because of its huge bolls of fluffy cotton swinging pendulous like hang-birds' nests from the ends of the spreading branches, but because of its massive spiny armor, each spine from one to two inches long, and studded as thick as they can stand around the trunk from the ground to the branches. These spines develop curiously by an addition of cortex each year at their bases, and the relative thicknesses of these successive layers constitute a good index to the conditions for the growth of vegetation from one season to another. Brazil wood is so common as to be an article of export, and it is also largely used for firewood on account of its peculiarity of burning while green as readily as many other varieties when dry. But the paramount family is leguminous. It is very noticeable that whereas the *Leguminosæ* are represented in the mountains farther north by a great number of species of annuals, here in Sinaloa and western Durango almost every member of this family is arboreal. The first tree that greets one on landing at Altata is the fire tree *(Poinciana regia)—palo de fuego* in the vernacular—with its crown of dazzling scarlet, and its gigantic sword-beans still lingering from last year's fruiting. In the hill country the same genus is present in the form of a shrub, called *tahuachin*, which covers large areas from May until September with flaming scarlet and yellow. An American would instinctively term it the burning bush. These are the most conspicuous leguminous trees, but the woods are teeming with acacias of many species, each with some striking peculiarity of scented blossom, or grotesque spine, or lacy leaf, or brilliantly colored beans.

This forest growth affords unceasing interest as the seasons follow each other. During the summer rains the foliage is luxuriant. The hills turn green almost at the first touch of the rejuvenating showers. But nature had anticipated the coming of the rains. For a month before, while the earth was parched and the air heavy with dust, while the cattle were dying for want of food and water, and travellers gauged their day's journey by the distance between water holes across the desert, the forest was gradually changing its hue. The swelling buds cast an unusual warmth of reds and yellows across the landscape. Presently here and there a bud burst and a bit of green peeped forth. All through the glaring heat of June the signs of spring were gathering; and when the rains baptized the earth on St. John's Day, the woods were ready to respond by a sudden flash of green. This is not the season of flowers. It is the time for growing leaf and maturing fruit. When the rains are ended in September or October, and the leaves begin to wither and fall, then the blossoms appear. First the amapas like pink roses, each tree a great bouquet, illuminate the hills; then follow others, yellow, white, red, blooming persistently for months, the quantity of bloom increasing as the dry season reaches its height. There are no fairy dells for flowers. The woods themselves are a flower garden.

Above these hardwood forests are two other zones of vegetation, distinct and

characteristic. First come the oaks, usually associated with palmettos—gnarled, scrubby oaks, growing apart like apples in an orchard, with grassy areas between. Above these are the pines, keeping well up out of the lowland heat on the line of frost. Theoretically, these zones represent different altitudes, and the natives undertake to measure elevations by them. But Nature makes rules as Greek grammarians do, to illustrate their verity by exceptions. Grassy patches of oak forests will extend far down among the hardwoods, and make breaches in the pine groves high up in the Sierra. It is not altogether a question of northern or southern exposure, either, that settles these vagaries. It is partly due to peculiarities of soil, and partly to the amount of moisture present, which by evaporation makes a local difference in climate.

In the deep arroyos other changes in vegetation occur. Here the moisture-loving wild fig finds a congenial habitat. It has strayed away from its native tropical lowlands to its utmost northern limit. It is able to exist, to build its massive dome of green, and to produce its lavish harvest of nearly useless fruit, but it has also lost some of its majesty and independence. Let a seed fall near some stalwart *manto* or *tepehuaje*, and the young fig springs up, reaches out and fastens upon the older tree, gradually enveloping it and in time crushing it to death. Many other tropical plants thrive in these arroyos, showing how readily this land might be covered with jungle were rains abundant. The soil is fertile, the temperature high. Only water is needed to make it a productive region. Nature has adapted a vetetation to the prevalent conditions, but man is undertaking to reclaim extensive areas for his uses by irrigation, and a few years more will witness immense changes in the character of this country. A land that can produce both tropical and semi-tropical plants side by side, and which has broad valleys of virgin soil, cannot long remain untouched by the progressive spirit of the age.

COURTENAY DE KALB.

CHÂTEAU BAGATELLE.

PARIS, July 31, 1903.

I have never had so vivid an impression of a past age as in a recent visit I made to the château called Bagatelle, which is surrounded by a great park, close to the Bois de Boulogne. Enclosed by a high wall, it forms, in fact, a part of the Bois. The château looks over the broad valley of the Seine, a great open space, having for its horizon the hills on which Saint-Cloud is built.

Bagatelle is not open to the public, and is not inhabited at present. It has a certain air of mystery, and its graceful lines seem at times almost like a dream. It is a curious contrast to come from the parts of the Bois filled with crowds of people, with horses, carriages, and automobiles, and to enter into this "château de la Belle au Bois Dormant." Nothing has ever recalled to me so well as Bagatelle, with its elegance and its charm, the words of Talleyrand, who said that no one who had not lived in France during the years which preceded the Revolution knew "la douceur de vivre." This mysterious château was long inhabited by Sir Richard Wallace, who filled it with marvellous treasures which are now to be seen in the Wallace Museum in London. It is quite empty; there is no furniture, there are no carpets, no hangings, no pictures; but the decorations of the walls, of the ceilings, of the shutters, which, according to the fashion of the time, are of solid wood, remain, as do all the chimney-pieces with their beautiful marbles and bronzes, and each room is worthy of study. There is even in the emptiness and lifeless solitude of the place something that harmonizes with the general aspect of Bagatelle; you feel that it is all a thing of the past, a past which has left only traces of its grandeur. The garden, which is behind the château, is one of those—shall I say Italian or French gardens?—which accord so well with architecture, which have terraces and marble vases. It is well kept, and its colored rows of flowers reminded me of the verse, "Full many a flower is born to blush unseen."

The history of Bagatelle and of the Bois de Boulogne is not without interest. There was already at the end of the seventeenth century a château (which was called Madrid) not far from the present Bagatelle. It was a royal mansion, and was given to Mademoiselle de Charolais, a daughter of the Prince de Condé and of Mademoiselle de Nantes, who was herself a daughter of Louis XIV. and of Madame de Montespan. Madrid was in bad preservation, and Mademoiselle de Charolais did not like it; the King gave her a piece of land on which she constructed a house, at first called "Mademoiselle's Pavilion," and soon after "Bagatelle." The name suited well that light and extraordinary person, very fond of pleasure. She gave many parties, and among her guests were often ladies who led a life far from austere in the Abbey of Longchamp. There is a curious portrait of Mademoiselle de Charolais, painted by Boucher, in which she wears the gown of the sister of Saint Francis, who lived with a cord round her waist. Voltaire wrote on the subject of this portrait a well-known quatrain:

> "Frère Ange de Charolais,
> Dis-nous par quelle aventure
> Le cordon de Saint-François
> Sert à Vénus de ceinture."

Madamoiselle de Charolais occupied Bagatelle for twenty years. She died on the 6th of April, 1758, at the age of sixty-three, and by her will left her fortune to her nephew, Louis-François-Joseph de Bourbon-Conti, Count de la Marche. Bagatelle is not mentioned in the will, as she had let it in 1745 to a M. Lévêque de Gravelle. In 1747, Louis XV., by a royal act, gave Bagatelle during her lifetime to the Marchioness of Mauconseil. Royal mansions could be transferred only in this way, and could not be alienated. Madame de Mauconseil remained in possession for thirty years, and had all sorts of difficulties with M. de Marigny, the superintendent of the royal domains. In 1770, the Prince de Chimay became the occupant of Bagatelle, but remained in it only a short time, and in 1775 the Count d'Artois bought the life interest, the garden, and the furniture for the small sum of 36,000 livres.

The Count d'Artois (afterwards Charles X.) was the grandson of Louis XV. He was born in 1757, and was married at the age of seventeen to Marie Thérèse of Savoy. His eldest brothers were the prince who became Louis XVI., and the Count de Provence, who became Louis XVIII. The Count d'Artois was the most extravagant prince of his time. He had a number of domains, was a gambler, a betting man, and constantly in money difficulties, and his brother, Louis XVI., had several times to pay his heavy debts. He was a great Anglomaniac and kept racing horses for which he paid very large sums; he even appeared at some races as a gentleman rider. He openly kept mistresses, whom he chose among the ballet girls of the opera. He kept a gaming table in his own house; he was, in short, the most profligate prince of a very profligate period. He bought Bagatelle at the age of eighteen, and began two years afterward to improve it. He made great plans, took the King and Queen to visit the grounds, and described all that he projected. The Queen was amused by this description of imagined improvements, and he promised to give her a feast at the end of six weeks, when she would witness the realization of what he had portrayed. The new château was ready at the time fixed. The architects spent in this short interval more than a million of livres. The château, to be sure, is small; it is really a mere pavilion with a circular salon on the ground floor, and on both sides of it several boudoirs, a dining-room, a *salon de jeu*, besides a fine vestibule. Bellanger was the architect who constructed Bagatelle and its dependencies. Numerous plans and engravings of it are preserved at the Hôtel Carnavalet. The changes afterward made were very important, but the central pavilion and the long building called Trianon have not been altered.

The park was planted and designed by an English gardener of repute, Thomas Blaikie. It was very much admired, and deservedly. There was, of course, after the fashion of the time, a "Temple of Love," a pretty circular portico with a cupid and the device of Voltaire:

> "Qui que tu sois, voici ton maître,
> Il l'est, le fut, on le doit être."

There were also two little rivulets, filled with water drawn by machinery from the Seine. A small theatre was often improvised in the garden, where comedies and ballets were played. The Count d'Artois had a fine artistic taste, and employed at Bagatelle the best architects and artists of the time—Bellanger, Soufflot, Gabriel, Houdon, Hubert Robert, L'Huillier, Dusseaux, Callet. Most of the bronzes, which are still on the chimney-pieces, were the work of the famous Gouthière. The furniture was chiefly furnished by Jacob.

The Count d'Artois remained in France till the day after the storming of the Bastille. He refused to wear the tricolor cockade which was presented to Louis XVI. at the Hôtel de Ville by Bailly, the Mayor of Paris. He was the first to take the road of emigration. Curiously enough, he had engaged, for a game of tennis (*paume*) at Versailles, the place which became historical as the *Jeu de Paume*, on the very day when the Third Estate had its meeting there. When, in 1790, by order of the State, a list was made of the debts of the Prince (his property had been seized, in virtue of the laws against the *émigrés*), the liabilities amounted to thirty-nine millions two hundred and fifty thousand livres. Bagatelle was among the assets. The Convention decreed that "the houses and gardens of Saint-

Cloud, Bellevue, Mousseaux, Le Raincy, Versailles, Bagatelle, Sceaux, l'Isle-Adam, and Vanves, should not be sold, but should be maintained at the expense of the Republic, to furnish amusement to the people and form establishments useful to agriculture and the fine arts. Bagatelle was sold, however, very soon afterwards, as the Government was in need of money, and sold for a trifling sum. It became a place of public amusement; a theatre was built in the park. But the distance from Paris was too great; the place was again put up for sale to a restaurant-keeper. Napoleon reunited Bagatelle to the public domain, and gave as indemnity to the restaurateur the sum of 170,000 francs. Napoleon gave Bagatelle to his brother Lucien, and afterwards to Prince Eugène; the young King of Rome was often taken to it.

During the invasion the Allies camped in the wood. Wellington had the offer of Bagatelle for his headquarters, but declined it. As soon as peace was signed, the Count d'Artois again took possession of the house he had built in his youthful days. He was now quite another man, very grave and very religious. He allowed the public to visit the house and the park on given days. The Count de Chambord took his promenade in Bagatelle almost every day. In 1830 Charles X. returned into exile, and Bagatelle was added to the civil list of Louis-Philippe, in consequence of an exchange of land with the State. Louis-Philippe never entered it, and in 1832 a special law authorized the sale of Bagatelle. In 1835 it was acquired, for 300,000 francs, by Richard Seymour Conway, eldest son of the Marquis of Hertford, and from his hands the domain passed into those of Sir Richard Wallace.

Correspondence.

THE PENSION DEGRADATION.

To the Editor of The Nation:

Sir: Washington dispatches announce that

"Leaders in the Grand Army of the Republic are actively at work on a service pension bill that they think can be put through the next session of Congress. The bill calls for a monthly pension of $12 to every survivor of the civil war who fought on the Union side, and to pay a similar pension to the widow of every soldier.

"An effort will be made at the coming Grand Army encampment to secure endorsement of the scheme. Then pressure will be brought to bear on Congressmen to secure the passage of the bill; the leaders basing much of their hopes on the exigencies of the Presidential election."

Such a statement may well challenge attention. It should do more: it should bring into active opposition every citizen who has at heart the welfare of his country. Since the close of the civil war, we have seen the pension list growing, apparently without limit. Passing, by ten or twenty-fold, the sum that the most indulgent justice could give, and by a much larger ratio the amount granted by any other nation, the pension list for years past has entailed on us an annual expense equal to or greater than that required to support one of the great standing armies of Europe.

This debasement of the veterans of the North may be laid, in its beginning, to the charge of the pension agents: Keen for their fees, unscrupulous in their methods, and tireless in pursuit of their game, they undermined the moral standards of their victims. The veterans, to their disgrace, easily lost sight of their true relation to the national Government. The old soldiers forgot, and still forget, that at no time have they ever had a claim for one dollar in pensions, as a matter of right. The call to arms was one of the supreme acts of the sovereignty of their country, exercising, in its mortal agony, its unquestioned right to sacrifice its citizens for its own preservation. When they sprang forward to answer their nation's call, they knew that they owed her their wealth and life; and that all they were or hoped to be were advantages merely held in trust, to be surrendered when the proper summons came. But, after the services had been rendered, the veterans, grown strong by organization, dictated to politicians, controlled Congress, and dominated political parties, insolently claiming as a right what was merely the generous gift of their country. Of a poor quality, indeed, is the patriotism that rests on pecuniary gain; and we may read on many sinister pages of history the decay of nations whose armies misused their power to attain selfish ends. Now we may see the shame of the fathers reappear in the sons, as the lusty mob of young men who enrolled for the Spanish war clamor with steadily increasing numbers at the doors of the Pension Office.

If the veterans, in their age, could but feel the noble patriotism which throbbed in their veins with the drum-beats of forty years ago, they could cut down the pension lists themselves to reasonable figures. But they will not do it. It is therefore more than time for the community to set about self-protection. It is time that political parties be made to feel that they have urgent duties to perform in this matter and to set about it fearlessly. It is time for the public to realize that the old soldiers, with honor sadly tarnished, have sunk so low as to become a grand army of mendicants.

George Edwards.

San Francisco, August 2, 1903.

THE POST-OFFICE AS A DUMPING-GROUND.

To the Editor of The Nation:

Sir: About three years ago I wrote you calling attention to the noble patriotism of Senator Beveridge, as shown by his willingness to offer up his elderly father-in-law for the purpose of enabling the Post-Office Department to properly conduct postal affairs in Porto Rico.

It seems that the old gentleman was not able to hold his job in Porto Rico, and so he had to be provided for in the Indianapolis Post-Office. The enclosed clipping from the Indianapolis *News* is interesting, therefore, as showing further results of Mr. Beveridge's patriotic effort. Imperialist.

Indianapolis, August 3, 1903.

"I did not ask the Post-Office Department for the dismissal of George J. Langsdale, bookkeeper, from the staff of the local post-office," said Postmaster George McGinnis, discussing the reports that have come back from Washington concerning a letter which he forwarded to the Department. "I did, however, ask that he be permitted to do his light work at his home, so that we might have his desk in the office. We are badly cramped for space now."

Washington dispatches state that in his letter Gen. McGinnis severely criticised Langsdale, who is Senator Beveridge's father-in-law, and that this criticism has aroused the ire of Senator Beveridge, who has asked that no steps be taken until he and Langsdale have been heard, a request that has been granted.

Postmaster McGinnis this morning said that whatever he said about Mr. Langsdale's duties will be repeated in the investigation that, it is generally expected, will follow. Postmaster McGinnis leaves Monday for the East to attend a meeting of the first-class postmasters, and it is probable that he will then be called on by the Department for a personal interview regarding the Indianapolis office.

THE NEW CRIME.

To the Editor of The Nation:

Sir: In a book published in London, in 1864, entitled 'Forty Years of American Life,' I, a few days since, chanced upon the following part of a supposed dialogue between a Northern abolitionist and a Southern slave-owner:

"'Negroes have been burnt alive. You cannot justify such a horror.'

"'No. There is no law for such a proceeding, except Lynch law; and in the few cases in which it has been done, it was to punish a negro for an outrage upon a white woman—the same punishment that was formerly inflicted in England upon heretics and witches. I do not justify it in any case. It has always been the work of a lawless mob, excited by some terrible outrage. It is a cruel punishment; but one that hundreds of poor white women have brought upon themselves by no worse offence than wearing crinoline.'"

The book in question (2 volumes, John Maxwell & Co.) was written by Dr. Thomas L. Nichols, a warm sympathizer in the Secession movement although born and brought up in New Hampshire, and a sincere, as well as earnest, apologist for "the Institution."

I quote the paragraph in question merely to show how erroneous was the statement made by the Southern correspondent of *Harper's Weekly* referred to by Mr. Griscom in the *Nation* of July 30. Not only was the crime in question known in the South before emancipation, but even then, by an unwritten law, it was punished by burning at the stake. C. F. A.

Boston, August 4, 1903.

To the Editor of The Nation:

Sir: I doubt whether isolated instances of the "new negro crime" being an old one prove anything more than that there is a dormant beast in human nature—which requires no proof at present. However, if the fact is of any importance, in the winter or spring of 1852-3 a negro on the lower Mississippi, I think in Louisiana, committed an assault on a young white girl, and was burned alive by the people of the neighborhood. The occurrence was read to me from a local newspaper by a young married lady from that part of the country. On my expressing my horror at the lynching, she returned indignantly: "Why, the paper says the girl may die!" K.

August 10, 1903.

THE TEXAN REVOLUTION.

To the Editor of The Nation:

Sir: There are one or two points in the review of my 'Texas' in your issue of July 23 that I feel I ought not to pass over in

silence. Speaking of the colonization of Texas and the revolution, I said: "Naturally enough, the movement resulted in a wide extension of the slaveholding area; but the idea that it was consciously inaugurated and carried out with that end in view is too palpably mistaken to be worth discussion." This the reviewer calls "too curt a dismissal of a difficult matter."

I believe it will be impossible for any fair-minded man to go through the documents I have had to examine, without coming to the conclusion I have expressed. In all the mass of Austin's correspondence and the materials in existence relative to the general *empresario* movement, there is nothing to show that the Anglo-Americans came to Texas in order to win ground for slavery. Von Holst himself says ('Constitutional History of the United States,' II., 553) : "I can find no support for the assertion that back of it [the colonization of Texas] there was a definite plan of the 'South.' " In the various petitions to the Mexican Government and declarations of grievances that mark the progress of the revolution from 1830 onward, there is no mention of slavery. This is not because the Texans cared to avoid the subject, but because they did not regard the institution as in danger. Moreover, there is, in the private papers, diaries, etc., belonging to that period of the history of Texas, no evidence that slavery was one of the real causes of the revolution. The friction caused by the ineffective anti-slavery legislation of Mexico was threatening for only a moment, and that in 1829. Thereafter, as other issues grew more intense, it practically disappeared altogether. The documents make the actual causes of the revolution sufficiently clear, and these have been, as I believe, faithfully outlined in my 'Texas.'

As to Houston's connection with Jackson before he came to Texas, there is none but the flimsiest evidence to make out of it a conspiracy. Even if one could believe what Dr. Robert Mayo claims—that Houston was organizing a movement to revolutionize Texas, and that he was acting with Jackson's knowledge—certainly the scheme was never carried out as planned. Twice Houston appeared in Texas at critical moments when the revolution was gathering, once near the end of 1832 (when he stayed till after the convention in April, 1833), and again in the summmer of 1835, but in both cases only after trouble had already begun. In the interval he is lost to public view, so far as has hitherto appeared, except for one or two glimpses. The theory of a secret influence emanating from him during that period has no value, first, because the evidence to support it is wanting, and, second, because what happens is sufficiently accounted for without it. He organized no filibustering movement and brought no troops to Texas, and in no case was the initiation of resistance to Mexico due to his presence or effort. He simply assumed the leadership of a spontaneous popular movement well under way, and carried it to a successful termination. There is, throughout the struggle, nothing to show that he was consciously working for the "slavocracy."

I wish to speak briefly of two other faults that the reviewer finds in the book. He says that the latter part of it (dealing with the period subsequent to the revolution) is "inadequate," and he objects to the omission of a bibliography. When I undertook the work, Dr. Scudder, then the editor of the series, insisted on compactness, and I agreed with him. He set the ideal limit at 360 pages, and I tried to come as near it as possible. By an unfortunate miscalculation of my own, I lost fifty pages, but these would scarcely have sufficed to relieve a criticism made from the reviewer's standpoint. Detailed references in footnotes were avoided because of the popular nature of the book. A bibliography would have been either too voluminous to fit the condition of compactness, or too general and incomplete to be of any real value.

Further reply, strongly as I am tempted, I must forego. GEORGE P. GARRISON.

UNIVERSITY OF TEXAS, AUSTIN, July 26, 1903.

[We had no belief in the idea that the revolution in Texas was consciously inaugurated or carried out by the "slavocracy." But the real problem for the historian of Texas is not even stated in this hypothesis, much less solved by denying the truth of it. That slavery did not cause the Texan revolution may be admitted; that there is no important historic relation between the Texan revolution and the slavery conflict in the United States is another matter. We must still take exception to a history of Texas that fails to exhibit at every point the vital connection between Texas and the United States. The first half of Professor Garrison's work exhibits that relation clearly; the last part all but ignores it.

No importance is to be attached to the Houston story, but it has been widely circulated in popular histories, and it would have been well to mention it, if for no other reason than to refute it. With reference to the omission of a bibliography, we were not aware of the author's miscalculations, and were under the impression that the forty or fifty pages of unused space might have proved sufficient for a useful discussion of at least the unprinted sources.—ED. NATION.]

Notes.

The Walker-Ellerson Publishing Company of this city have nearly ready a novel entitled 'The Curse of Caste,' by a Virginian.

Macmillan Co. announce 'J. McNeil Whistler and his Work,' by Alfred G. and Nancy Bell. They expect to publish next year the Life of Leo XIII. on which Mr. Marion Crawford has been engaged with the collaboration of Count Soderini.

The Life of Sidney Lanier in Houghton, Mifflin & Co.'s "American Men of Letters" series is to be prepared by Prof. Edward Mims of Trinity College, N. C.

Something out of the ordinary run of academic dissertations is 'The Alchemist, by Ben Jonson,' edited by C. M. Hathaway (Yale Studies in English, XVII.), a well-printed octavo of some 375 pages (Henry Holt & Co.). Jonson is coming again into his proper share of attention. The Clarendon Press edition of his complete works, now in preparation, will doubtless do him full justice. Indeed, it will perhaps make such performances as this works of supererogation. Meanwhile, however, the opportunity was an open one and peculiarly tempting. 'The Alchemist' is important enough (Coleridge thought it one of the three best plots in all literature) and of such a nature as to cry aloud for full historical and explanatory apparatus. This Dr. Hathaway has abundantly supplied. There is an introduction, with much new material, dealing not only with questions of editions, dates, sources, and the like, but more especially with the history and literature of alchemy. It is a contribution to the always-to-be-continued history of swindling—"gulling" and "cony-catching," as it was called in Elizabethan slang. The text, so far as we have tested it by a partial comparison with a copy of the "Folio" of 1616 on which it is based, seems to be unusually accurate. The Notes and Glossary are copious and valuable.

'The Life and Letters of Charles Butler,' by Francis Hovey Stoddard (Charles Scribner's Sons), is a volume written (as Mr. Butler's daughter says in her preface) in commemoration of a life associated in such a way with the development of the country as to give the book "some value as a contribution to its history." Mr. Butler, whose marked figure and face made him familiar in New York to a generation who did not know much more of him than these and his name, may be said (he died in 1897 at the age of ninety-five) to have come down to us from the Jacksonian period. He was a younger brother of Attorney-General Benjamin Franklin Butler, and lived in the golden prime of those "internal improvements" which marked the beginning of the march of the United States to the West. He was honorably known as an able negotiator of arrangements between States involved in difficulties through these improvements, and their creditors, and also through a long and active connection with the University of New York.

'The Tramp's Handbook,' by Harry Roberts (John Lane), is an illustrated compendium designed for devotees of the open-air life. It is written for England, but contains a good deal of information useful anywhere, as to means of providing food and shelter, clothes, *impedimenta*, etc. There is a "defence of vagabondage" which sets forth the superiority of the free, peripatetic life over that of the poor wretches who dwell in cities and slave in order to pile up accursed wealth, or pore over miserable books, or let ambition gnaw their hearts. There is also some "weather wisdom," some astronomy, and an English "Floral Clock." In books of this sort we always look to see what the author deems absolutely essential in the way of baggage for those who walk for pleasure. Mr. Roberts declares that for himself he can put anything he needs into his pockets. But even among the things put down as "necessary" the critical reader will find a superfluity. What is the use of "a few envelopes"? If a tramp has to engage in correspondence, he must mail his letters, and this must generally be done in the vicinity of a post-office, where he can always, if necessary, obtain envelopes.

'Belgium and the Belgians,' by Cyril Scudamore (E. P. Dutton & Co.), is something

more than an illustrated guide-book, though much of it is information of the kind useful to tourists. It contains chapters on education, government, and folk-lore, and a detailed description of a tour made by the author in 1899 through the Liège district and the Ardennes—a part of Belgium probably not as well known to Americans as Flanders, Antwerp, and Brabant. To our mind Belgium as a holiday ground has never been thoroughly "written up." The country is full of interest, but the interest is of a kind not easily conveyed in books like this. Lists of pictures give a very faint idea of art; and to be properly awakened to the history and romance of Belgium the mind may be guided by Baedeker and by Mr. Scudamore, but must first be saturated with Motley and Scott. Belgium has not been as well *prepared* by the inhabitants for tourists as Germany; but then this may be said of every country other than Germany in the world.

'The Training of Wild Animals,' by Frank C. Bostock (Century Co.), deals chiefly with the carnivors, but touches also on elephants and snakes. It furnishes no very detailed account of the actual training of wild beasts for performance in the show ring, but dwells on the traits of animals in captivity and the hazardous lives of their trainers. The author is, in the opinion of high authority, the greatest of all wild-animal trainers. Any one who has seen his spirited lions, tigers, and jaguars in the arena will have noted the difference between them and the dull brutes of many other shows, whose performance consists in mounting pedestals. Mr. Bostock is very modest, giving all credit to the trainers under him, and not letting the reader see enough of himself, the trainer of trainers. He brings out many interesting facts about captive animals. He says that a quiet, sullen lion or tiger is more to be feared than a snarling, clawing one, and that a playful lion is a terrible thing in the arena. He tells how animals that have performed submissively for years, especially the large carnivors and elephants, may at last refuse to do their tricks and become frenzied, springing on their trainers with murderous intent. This violent transformation, the dread of all showmen, is called "going bad," and costs many a human life. One of the secrets vital to success in the ring is absolute uniformity in action, manner, and even dress. Deviation from the habitual routine is likely to result in accident. The book must hold the attention of any one who can appreciate the high order of courage demanded of the man who enters the arena with a beast that by one tap of its paw can crush his skull like an egg shell.

'Our Feathered Game,' by Dwight W. Huntington (Charles Scribner's Sons), is a treatise on land and water birds from the sportsman's point of view, and aims, like certain other recent works on the subject, to give enough ornithological description of each species to enable the layman to identify the birds he bags. What the author has to say about the absence of characters that should separate certain sub-species will appear footless to the systematic ornithologist, and the description of hunting wild turkeys may amuse sportsmen who have shot the king of our feathered game, but on the whole the book is remarkably free from slips. The parts devoted to the woodcock and the Wilson's snipe are especially good. The author's point about holding well ahead of a swift-flying game bird is one that old hands as well as novices should bear in mind. The subject most valuable, perhaps, and less adequately treated in other late books, is the preservation of game birds and the legislation therefor. Interesting accounts are given of various ducking clubs and their methods. The registers of several clubs are inserted, showing alarming decrease, during the last ten or more years, in the bag of our most valuable ducks. Upland game preserves are described, and game laws bearing on the limit of the bag and suppression of the market hunter are discussed. The author has attractively illustrated the book with his own colored drawings of hunting scenes.

A number of essays, under the title 'La Chronique de France,' are published annually by Baron Pierre de Coubertin. One may peruse, in the latest of these, reflections on the war on the congregations, the significance of the elections, religion in France, and the city of Paris; or critical estimates of Hugo, Comte, Dumas, and Balzac; or observations on national sports and three centuries of tapestry. The survey can hardly be called complete, but those who cannot spare time to read the French papers may obtain some idea of the course of events from these pages.

The finest of the plates in the June number of the *Burlington Magazine* (New York: Samuel Buckley & Co.) is an excellent photogravure after a Madonna and Child from the Leuchtenberg Gallery at St. Petersburg, where it passed as a Giorgione. It is now in the collection of Mr. George Salting, and is ascribed by Mr. Herbert Cook to Cariani. Without being in any sense a masterpiece, it is a delightful picture, especially in its richly decorative landscape background. The other "Giorgione," from the same source, is a very inferior performance and of little intrinsic interest. To us the most interesting work of art discussed is an Italian bas-relief recently acquired by the Louvre through the bequest of M. Paul Rattier; an almost feminine head, in highly decorative armour, inscribed "P. Scipioni." In the absence of any authenticated work in sculpture by Leonardo da Vinci with which it could be compared, it is doubtless wise to attribute this relief to his school only. Every line of it, as decoration, bears witness to his influence, and the face is of a type common in his drawings. As far as one may judge from the reproduction, the execution is not unworthy even of the great master himself. The "Gazette" gives the usual account of sales and prices.

With the issue of Parts VI., VII., and VIII., 'Representative Art of Our Time' ("The Studio" Library, John Lane) comes to an end. The best plate in the three numbers is the very able etching, "L'Abreuvoir au Pont Marie," by A. Lepère, best known for his original wood engravings; the worst we shall refrain from mentioning, in the hope that the clever illustrator who is guilty of it will refrain from doing the like again. The picture by G. F. Watts selected for reproduction seems to have all his technical weaknesses and none of his great qualities of composition; and the reproduction, at least, is very disagreeable in color. If the collection, as a whole, were really "representative" of contemporary art, we should have less faith in the artistic outlook than we have.

Even the first instalments sent us of 'Hundert Meister der Gegenwart' (Leipzig: E. A. Seemann; New York: Lemcke & Buechner) had not revealed to us, as do the eighth, ninth, and tenth numbers, the full horrors possible to modern color reproduction. It is safe to say that even handwork, guided by the strongest taste, could produce no more nerve-shattering results than are here attained by mechanical processes, and we doubt if the originals could stand comparison with the copies. It is one more glorious triumph for the age of invention.

Mr. George Iles's imagined department for library construction, in his Aladdin's palace headquarters of the American Library Association, has been in a way anticipated by the American Architect Company of Boston, who have just put forth the first number of a very taking *Public Library Monthly*. "As it is," says the salutatory, "to be a periodical 'devoted to libraries, books, and their makers,' it must naturally concern itself somewhat with the planning and decoration of library buildings, but its architectural character will go no farther than this. In reality it aims to bring librarians into closer touch not so much with one another or with book publishers—ends already satisfied by other existing publications of a literary complexion—but with the general public whom each library serves." The new monthly has even larger pages than the *American Architect*, and is handsomely illustrated, although it is difficult to see the appositeness of the fine view of Ratisbon from the Danube.

The articles of most general interest in the *Annales de Géographie* for July are upon the precipitation in Algeria, the results of observations begun in 1843, and an account of an expedition through the region bordering on the southern and eastern shores of Lake Chad. It is interesting to note that though the natives cultivate extensively wheat, rice, and corn, the most fertile land is reserved for cotton, and that strips of cotton form the medium of exchange among them. The other contents consist mainly of a study of topographical phenomena in the Alps ascribed by the author to the erosive power of glaciers, and a minute description of a small valley in France, its inhabitants, their social organization and industries. M. E. F. Gautier, who is now engaged in exploration in the Sahara, writes that he has discovered in one of the oases a vast number of rock drawings of men and animals. Among these are pictures of the giraffe, ostrich, and boar, which have disappeared from this region, while there are no representations of the elephant, rhinoceros, and buffalo, "which have been found frequently farther north in the Atlas Mountains." Of perhaps greater importance is a Hebrew inscription, "très belle, profondément gravée," and some stone circles, "which it would be interesting to excavate; they have certainly nothing in common with the present inhabitants."

The last Quarterly Statement of the Palestine Exploration Fund contains the fourth quarterly report of the excavation of Gezer. Mr. Macalister reports nothing of special interest since the discovery of the great

pre-Israelitic megalithic temple. He summarizes the general results of one year's work of excavation as follows: Traces of the Levitical occupation mentioned in the Bible found in the evidence of Jewish worship at the Great Central Shrine of the town; the destruction of the city under Solomon, and its fortification by Bacchides in the time of the Maccabees, illustrated by the discovery of towers and walls belonging to those two periods respectively; the method of disposal of the dead by the pre-Israelites, that is, by burning, determined with certainty; the nature and extent of Mycenæan and Egyptian influences on the development of Palestinian culture illustrated; the period of the introduction of iron indicated. It must be said that the first two counts of this summary are extremely hypothetical. Mr. Macalister reports that unless the number of workmen can be increased, the excavation of this ruin cannot be completed within the limits of the firman. To increase the number of workmen requires an increase in the funds available for the work. It certainly seems that the Palestine Exploration Fund should obtain, in both England and this country, a more generous support in its work of excavation.

The fourth issue of Lidzbarski's *Ephemeris für Semitische Epigraphik* appears as the first part of Volume II. This periodical is issued at irregular intervals, when Professor Lidzbarski has secured enough material to complete a new part. It is of great value to the student of Semitic epigraphy and archæology, as it collects under one cover all the material in those fields which has appeared scattered through numerous books and publications, with illuminating notes and discussions. There is nothing of striking importance in the present number. In what may be called his editorial, Lidzbarski discusses at some length Semitic nick-names. It would appear that in Semitic antiquity abbreviated and nick-names were as common in use, especially among the plainer people, as they are with us to-day. Considerable space is given to a report on old north Arabic inscriptions. Here, and in the report on south Arabic inscriptions, with which this part closes, the author pursues Halévy relentlessly, for the purpose of controverting his views on the Egyptian origin of the Phœnician alphabet and its dissemination from south Arabia northward. According to Lidzbarski, Phœnicia or Syria was the home of the Phœnician alphabet, from which place it was carried directly to South Africa. From there it spread northward through Arabia as far as the Hauran.

We have received from Lemcke & Buechner a colored topographical map of Cairo and its environs, by R. von Grimm. It is on a scale of 1:100,000, and strikingly exhibits the Egyptian strip between the Arabian and the Libyan Deserts. Steam railroads, actual and proposed, tramways, ordinary roads "passables à dogcart," footpaths, canals, wadies, palm trees, towns, cemeteries, are shown together with contour levels, and much besides. Here is marked the scene of the battle of the Pyramids, July 21, 1798; here the tracts inundated in winter; here the deep caves in the heights back of Massarah; here the great petrified forest at the head of Wady el-Tih; here an arms manufactory; and all the pyramids.

—The Prince Society has printed a volume on 'Sir Humfrey Gylberte and his Enterprise of Colonization in America,' edited by the Rev. Carlos Slafter. What Hakluyt compiled for his Voyages forms the more important contents of this volume, but a number of papers concerning Gilbert has been found in the English archives, and they make a very interesting story, though far from complete. Personally, this famous and ill-fated voyager had little to commend him to our notice. Like so many other "discoverers," he was a pirate at heart, and cared nothing for the rights of another people when his own advantage was in question. That he was no gentle knight the record of his life shows. In Ireland he resorted to very harsh measures in meeting some opposition to land-grabbing schemes of a company of English adventurers, and put to the sword men, women, and children to attain his purpose: He has left his policy in writing: "being constantly of this opinion, that no conquered nation will ever yield willingly their obedience for love, but rather for fear." The result was a legacy of hatred among the Irish, and as stern measures when the natives were again in power; which leads the editor to the curious and unmoral statement that "retaliation, with added refinements of torture, took away all ground for complaint of his [Gilbert's] atrocity." In his schemes for maritime discovery he always considered the profit to be made; and a singular act of true piracy committed by the crew of one of his own vessels was unpunished by him, so far as is known. Perhaps his weakness was his desire for wealth, for it led him into a project for transmuting iron into copper, and was the foundation of his ventures towards the New World, though the spread of the faith was urged as prominently as the advantages of trade. His death has made us forget much in his career, and surrounded him with a truly romantic atmosphere. Mr. Slafter has performed his task with judgment and almost with a sympathy for his subject.

—Several writers have thrown the public into transports of virtuous indignation by their graphic accounts of the iniquities of the Standard Oil Company. Those who have read these descriptions with a desire to ascertain the truth have found that most of the evidence was worthless, and that there was hardly the pretence of impartiality. It has remained for Mr. Gilbert Holland Montague to treat one of the most interesting of industrial phenomena with scientific thoroughness and with judicial fairness. The results of his study were printed in the *Quarterly Journal of Economics*, and are now published in book form by Harper & Brothers under the title 'The Rise and Progress of the Standard Oil Company.' It is impossible to understand this subject without knowing the conditions which governed transportation twenty-five or thirty years ago. As Mr. Montague says, the oil business, in its early phase, was the reflex of prevailing railway methods. "To attempt to judge the situation without first ascertaining the standards set by the railway management of the time is not merely unfair, it is subversive of all historical accuracy." The production of petroleum became of importance at a period when the trunk lines were competing fiercely for business. They were engaged in that competition which our Congressmen have declared by statute must prevail, and which not only railway managers, but also the business community, have found so disastrous as to compel agreement, lawfully or otherwise, for its cessation. The New York Central Railroad had to choose between abandoning the oil business of Cleveland or making rates which would equalize the advantages enjoyed by Pittsburg. The struggle was so desperate as nearly to ruin the railways. The Baltimore and Ohio and the Pennsylvania Railroads had to stop paying dividends. Such mad competition as this, which the law even now encourages, necessarily gives opportunities to men of ability to get the better of their rivals. The whole situation is admirably presented by Mr. Montague, whose book we must praise because it is brief, while it is so interesting that we could wish it longer.

—It is now about thirty-five years since the publication of 'The History of the Church from A. D. 313 to A. D. 451,' by William Bright, then an unknown name in Church literature. In that interval the learning and labor of half a lifetime had been spent by the late Regius Professor of Ecclesiastical History at Oxford University in accumulating materials for enriching his narrative. At his death the new book, rechristened 'The Age of the Fathers' (Longmans, Green & Co.), was left partly in the press, and partly in the form of notes; and it has been the task of Dr. Walter Lock and Mr. C. H. Turner to edit it. Their efforts and those of the publishers have succeeded in turning out two very attractive volumes, outwardly at least. They are intended for a larger audience than is generally to be enticed into the reading of Church literature, and so the scaffolding of footnotes which is thought by some to hinder popular appreciation of the text, has been cleared away. The narrative is lucid, and neither rhetoric nor theological discussion intrudes upon the straightforward story of the fortunes of the Church. Its very method of composition, however, renders it of no value to scholars who desire to learn the sources of their knowledge. The mechanism back of the work is essential to them, and, in leaving it out, the author and editors have considerably narrowed their sphere of influence. And yet, when we consider that, in so detailed a study, hardly a sign of German criticism or the influence of German thought can be found, we are inclined to think that it was wise, after all, to address this work to a popular audience—however unlikely it is that, in this age of short stories and monographs, many lay readers will read through a thousand pages on a single age of the early Church. A story of events rather than a picture of conditions emerges, and one never quite gets the impression of that tremendous age in which the Church took final form. We are watching the incidental and the individual rather than the full and intricate movement.

—'Birds in their Relation to Man,' by Messrs. Weed and Dearborn (J. B. Lippincott), is the first manual to be written on the food habits of birds, but it is so thorough and comprehensive as almost to preclude the need of others for a long time to come. It is not only a compilation of all the scat-

tered literature on the subject, but also a record of original work by the writers themselves. Unlike some other investigators, who lack breadth of knowledge, the present authors are ornithologists, botanists, and entomologists, and at least one of them understands the art of popular book-making, as is shown by Dr. Weed's former publications on biology for general readers. The book has many illustrations, and contains, in addition to food habits and their relation to agriculture, a treatise on the protection, preservation, and encouragement of birds. There is no attempt to enhance the value of the theme by touching lightly or not at all on the harm that native birds may do to crops. Other writers have sometimes kept this phase of the subject in the background, but here the treatment appears to be fair and square. Not only are certain species shown to commit depredations, but their destruction in some instances is advocated. Adverse criticism of the book is probably most valid where the knotty problem of the effect of the preying by birds on parasitic insects, and the much paraded but little understood "balance of nature," are treated.

—Among the many investigators whose long industry has made this compilation possible, the Biological Survey of the Department of Agriculture is particularly conspicuous, for the significant points of many of its publications are here skilfully massed. The Survey's methods of investigation have been watching birds as they fed in the fields, caging birds and offering them various insects, seeds, and berries, and, most important of all, examining the contents of birds' stomachs to determine the amount and character of the different elements of the diet. Most interest attaches to the writers' own observations. In one case the food brought to a brood of nestling chipping sparrows was noted from before sunrise till dark. In another, an adult captive crow is recorded to have eaten a quarter of its weight in minnows in one day—a performance which, translated into terms of man's diet, would mean the consumption by him of from thirty to forty pounds of beef a day. A general record of the animal and vegetable food of birds is followed by a discussion of the amount consumed and the effect of birds on the uprising of insect pests. The food habits of each species and their relation to agriculture are given in detail. The book is full of new knowledge, and should be in the library of every ornithologist, botanist, entomologist, general biologist, and agriculturist.

—The influence of Shakspere on Maeterlinck is most deeply marked in the philosophic essays. But in his dramas also his favorite hero is the Hamlet type, irresolute, repeating his words; like Sisyphus continually urging his stone upward, but it always falls back into the plain—the "ruthless stone." In his new play, "Joyzelle" (Paris: Librairie Charpentier), the Shaksperian dye is the more noticeable since the very texture is Shakspere's. It is a curious weave in which, as one reads, one instinctively dissentangles and identifies each separate *motif*. Merlin, the wizard of Arthurian legend, lives on an island attended by his "petite fée docile et familière," Arielle, the dainty, delicate Ariel of the "Tempest" transformed into a feminine sprite—a curious association of Merlin (who, in the 'Morte d'Arthur,' "sleeps and sighs in an old tree") with Shakspere's Ariel, who vented his groans in a cloven pine. He, too, was enslaved to the witch Sycorax, as Arielle is the servant of Merlin the enchanter. Merlin's son Lancéor is to be saved from death by a marvellous love—"un amour héroïque et plus doux qu'une fleur, . . . qui l'aperçoit partout, à travers toutes les formes et toutes les épreuves." Behold him, therefore, shipwrecked on the island like Ferdinand, and meeting there the shipwrecked Joyzelle, his Miranda. The ordeal of Joyzelle is the whole interest of the play. Threatened with death by Merlin, cast off by Lancéor, whom she knows to be unfaithful, she never wavers. A patient Griselda is Joyzelle, greatly enhanced by a noble gayety which one does not remember in her meek original. "All thy vexations were but my trials of thy love," says Prospero in the "Tempest." "Oui, ma pauvre Joyzelle," says Merlin, "le songe était horrible; mais le voilà vaincu et l'épreuve est passée."

—A certain setting and atmosphere one may count on in a play of Maeterlinck. A great "salle de marbre," a door which some one frantically calls to have opened, a seashore with strange shells and caves; above all, a sense of something vague and sinister, an invisible danger, the signs and omens of it thickening towards the end—all these are in "Joyzelle." Maeterlinck shares with D'Annunzio the power of leaving an impression of beauty amid horrors. From "Pelléas and Mélisande" on the stage one carried away a cool vision of a great cave with a floor of many-colored shells, opening on a misty sea. In "Joyzelle" the most vivid picture is the enchanted garden where the predestined lovers meet, a wild and neglected place as Joyzelle walks there alone; transformed at the coming of Lancéor into a garden out of a fairy tale, a marvel of flowers and fruits, birds and butterflies. This transformation "into something rich and strange" is more effective, one imagines, to the reader than it can be on the stage, where flowers are apt to be tawdry. The play had no great success in Paris last May, naturally enough. It is, in fact, a sort of morality play—the last thing that would appeal to the French taste, which clamors for the dramatic and, above all, the concrete.

HILPRECHT'S EXPLORATIONS IN BIBLE LANDS.

Explorations in Bible Lands during the Nineteenth Century. By H. V. Hilprecht. With the coöperation of Lic. Dr. Benzinger, Prof. Dr. Hommel, Prof. Dr. Jensen, Prof. Dr. Steindorff. Philadelphia: A. J. Holman & Co. 1903. Pp. xxiv., 793.

The main part of this volume consists of Professor Hilprecht's account of explorations and excavations in Assyria and Babylonia during the nineteenth century, traversing much of the ground already more extensively and yet more summarily covered in Rogers's 'History of Babylonia and Assyria.' Fully half of Hilprecht's contribution, one-third of the entire volume, is devoted to the work of the University of Pennsylvania expeditions to Nippur from 1888 to 1900. Professor Hilprecht was connected with the University of Pennsylvania work at Nippur from the outset, but the amount of time which he actually spent in the field was small. In 1888 he went out in a subordinate capacity as one of the Assyriologists, and was at the site of the excavations on this occasion for something over two months. In 1900 he again went out to take supreme charge of the work and to bring the excavations for the time being to a conclusion. On this occasion he again spent something more than two months there. His principal work in connection with the expedition has been, not in excavating, but in examining the antiquities secured, and especially in publishing the cuneiform records found at the ancient sacred city of Bel. His account of the excavations contained in this volume is, unfortunately, disfigured by constant and violent attacks upon the directors in the field under whom the excavations were conducted, and by an excessive introduction of the personal element. The reader is often impressed with the feeling that Dr. Hilprecht is more concerned to make prominent his own services and his own importance than to record facts and discoveries. As a true history of events, or as a correct statement of the plans and methods of his predecessors or collaborators in the work, this account cannot be accepted without much allowance for the author's personal equation. Its value lies in the fact that it is the first published statement of the extremely interesting and important discoveries of the University of Pennsylvania expedition in its last two campaigns (1893-'96 and 1898-1900).

There have been in all four campaigns of excavation at the site of Nippur: two under the direction of Peters (1888-'89, 1889-'90); a third under Haynes, who remained continuously in the field—the first time the experiment had ever been tried—from 1893 to 1896; and a fourth, again under Haynes, assisted during part of the time by two architects, Geere and Fisher (1899-1900), during the last ten weeks of which, as already stated, Professor Hilprecht was on the field and personally in charge of the excavations, for which he seems, however, to have had some responsibility throughout the whole of the last campaign as "scientific director."

The two most remarkable results of these expeditions have been the partial excavation of the great and most ancient temple of Bel at Nippur, with the discovery of remains of an almost incredible antiquity, and the recovery of immense numbers of inscribed clay tablets, including a "temple library." This library was found by Haynes on the last expedition, Hilprecht arriving on the field just as the excavation was completed and tablets boxed to be sent to Constantinople. Haynes, who was not an Assyriologist, could not, of course, be sure that the large deposit of tablets found by him was the long-sought-for library, and not a collection of archives such as had been found before in various parts of the mounds. It was Hilprecht who determined that they constituted a library; and one of the most interesting parts of the volume before us is that in which he gives an account (pp. 525-532) of the scope and contents of these tablets, so far as he has been able to examine them to the present time. There are numerous school exercises in which the students learn their *B-A ba*, very much after the fashion of boys at school to-day, word lists, grammatical ex-

ercises, multiplication tables, and the like. Apparently, also, something was done in the way of teaching line-drawing and clay-modelling. From this, Hilprecht concludes that there was a school or university connected with the Temple of Bel. Of the contents of the library proper, outside of the school-book exercises, he gives a rather meagre idea, informing us merely that there is a real library, and that the part so far found consists principally "of mathematical, astronomical, astrological, linguistic, grammatical," and to some extent religious texts. It is to be hoped that we may soon receive fuller information with regard to the contents of these ancient tablets, the greater part of which being, unfortunately, of unbaked clay, are, according to Professor Hilprecht's report, in a very bad condition, and that efforts will be made both to publish the texts and also to furnish translations as speedily as practicable. Hitherto the University of Pennsylvania has pursued, so far as the objects found in its excavations at Nippur are concerned, an unfortunately illiberal policy, which has prevented the speedier publication of results.

The great bulk of this library material belongs, according to Hilprecht, to an early period, namely, the third millennium B. C.; but the library also continued to exist into the late Babylonian period, and among the most interesting finds made in the "library mound" was a jar, which seems to have been the cabinet of a collector of antiquities at about the time of King Nabonidus, in the middle of the sixth century B. C. In this jar was found, among other things, a fragment of a "ground plan of the environments of Nippur," as it appears to be from the fact that the name Nippur is written in the centre. The reader could wish that the learned author had attempted some explanation of this interesting document in connection with his own scheme of the topography of ancient Nippur. Hilprecht believes that only a small part of the "temple library" has yet been excavated, and that the whole mound, several acres in extent, in which this deposit of tablets was found, constituted the libraries and schools of the temple; but the evidence furnished by himself and other excavators up to the present time does not seem altogether to support this view. Similarly his theory, expressed in his account of the topography of Nippur (pp. 541 ff.), that the ruins on the western side of the great canal which divided the city into two parts represented "the remains of the city proper, the eastern half the large complex of the temple of Bel," is not altogether supported by the facts, for considerable archives of temple records were found also on the western side of the canal, while on the eastern side was found a number of ordinary business records. In fact, the excavations so far conducted are not sufficiently complete to enable us to reach definite conclusions with regard to the contents of many parts of the great complex of mounds constituting the ruins of the ancient city of Nippur.

For the archæologist the material presented in this volume is too meagre to enable him to reach satisfactory conclusions regarding many of Professor Hilprecht's statements. The photographs are excellent, but the plans and drawings are few and small, and it is impossible to determine from them and the descriptions accompanying them how much was ascertained by actual excavation and how much is pure speculation. Thus, for example, on page 567, we find an interesting ground plan of a small Parthian palace. There is a difference of shading in the wall lines which leads to the supposition that part of this plan at least is speculation, but nothing in the text shows the actual facts. Again, on page 470 we have the "ground plan of Ekur, Temple of Bel at Nippur, restored and designed by Hilprecht, drawn by Fisher." This represents two courts of the temple, but we are not informed to what extent the lines of this restoration have been actually determined by excavation. In point of fact, a very considerable portion of it seems to be conjecture, and some parts do not appear to fit in with the statements of the author in other portions of the work. Professor Hilprecht announces the publication later of a fuller work on the temple with the drawings of Geere and Fisher, accompanied, presumably, by a descriptive text which will enable us to ascertain exactly what was actually excavated. Until such publication is made, it is impossible to determine the value of these speculative restorations, or of the statements with regard to the topography of the ruins in general.

The temple of Bel at Nippur was, according to all the records which we possess, the most ancient and greatest sanctuary of Babylonia, and it was this fact especially which determined the commencement of excavations at that site. The earlier excavations conducted at Nippur were naturally concerned principally with the upper strata of the immense accumulation of débris, and in the first years it was only by means of small wells and larger trenches, here and there reaching to virgin soil, that evidence was given of the existence beneath the later remains of a civilization almost incredibly ancient. The later excavations unearthed much larger parts of these earlier remains. As far as we can now determine, a great change took place in the temple of Nippur at the time of the famous Sargon of Akkad, whose date is variously estimated from 2800 to 3800 B. C. With him a new race and a new civilization seem to have become dominant at Nippur. All the buildings and constructions of any importance so far found belong to the later (Semitic) period, but the débris of the earlier (pre-Sargonic or Sumerian) period constitutes a full half of the entire accumulation in the temple mound. This pre-Sargonic débris is full from top to bottom, according to Hilprecht's account, of the remains of cremations of the dead. He believes that the temple was already at that time a temple or sanctuary, and that the characteristic *ziggurrat* or stage tower already existed; but, according to his account, this sanctuary was nothing but a necropolis or crematory. Strangely enough, also, the greater part of these pre-Sargonic remains are many feet below the level of the ancient plain—the lowest strata about twenty feet, which is much lower than the reported bottom of the bed of the canal that bisects the city. So far, therefore, as the account here given enables us to judge, the sanctuary must have occupied originally a huge hole in the "breast of the earth."

Such borings as have been carried down to the same low level in other parts of the mound, on the other side of the great canal, seem to show a condition of affairs similar to that found in the ruins of the temple. Here, too, the pre-Sargonic remains consist entirely of hopelessly broken fragments of walls, potsherds and ashes, the same evidences of a necropolis of cremation as was found on the temple site, the greater part descending below the ancient level of the plain. Was Nippur in those early days nothing but a necropolis, like some of the Babylonian sites explored by the Germans? Are there no pre-Sargonic homes of the living? And what is the meaning of the fact that these earliest remains are found many feet below even the "ancient level of the plain"?

With the time of Sargon, as already said, commences, so far as we now know, the era of really important constructions on the temple site, which ceases also to be used as a place of disposal of the dead. At this period, also, with the dominance of the new race, burning gives way to burial; but, according to Professor Hilprecht, we find at Nippur itself no burials until the Seleucidan period, in the fourth century B. C. The Babylonian burials from 2500 onward, found by the earlier explorers at Nippur, he declares are not Babylonian at all, but Parthian, and leaves us in the singular position of having, so far as Nippur is concerned, no knowledge and no trace of the method of burial during the entire Semitic period.

These excavations cannot be said to have settled the problems of Nippur. The history of the temple, its construction and its extent are by no means clear as yet, while as to the remains which underlie the old Semitic civilization at Nippur it must be said that Hilprecht's report raises more questions than it answers. It is, we repeat, to be hoped that we shall shortly have a fuller and more scientific statement of the results of the latest excavations, which have naturally overturned many of the theories derived from the earlier excavations and propounded by Peters in his 'Nippur' and by Hilprecht in his 'Babylonian Expedition of the University of Pennsylvania'; and it is also eminently desirable that the University of Pennsylvania should push onward to its conclusion the great work of excavating the ruins of this most interesting and most ancient city of the old Babylonian world.

We have left ourselves no space to deal with the contributions of Dr. Benzinger on Palestine, Dr. Steindorff on Assyria, Dr. Hommel on Arabia, and Dr. Jensen on the Hittites. The two former are admirable summaries of what has been done in Palestine and Egypt. The latter two, on Arabia and the Hittites, are somewhat too technical for the ordinary reader, and are also liable to objection as presenting theories which have not been substantiated, and which, according to the opinion of most scholars, cannot be substantiated. For example, Hommel holds that the Phœnician alphabet originated in east Arabia, and that the earliest Arabian inscriptions antedate the oldest Phœnician inscriptions yet found. Scholars in general do not agree with him in these views. So also few would agree with him in his belief that "the name Ai or Ya, which was occasionally used alongside of *ilu* (comp. Ai-'ezer, Yo-chebed), meant originally 'moon.' Moses first gave this ancient name a new significance by changing it, in the spirit of popular ety-

mology, to Yahve, 'he who exists'" (pp. 745, 746).

Jensen believes that he has found the key to the decipherment of the Hittite inscriptions, and that the language in which they are written was a sort of proto-Armenian. He treats with scant respect the efforts at decipherment of those who have gone before him: "So much for the labors of my predecessors and their results. . . . Throughout my decipherings, which I now proceed to describe, I have endeavored as far as possible to keep the two problems apart" (p. 772). Few scholars have accepted Jensen's results, and he himself has not yet succeeded, by the use of his key, in really reading the inscriptions.

KING'S MAZZINI.

Mazzini. By Bolton King. (The Temple Biographies.) London: Dent; New York: E. P. Dutton & Co.

Mr. King's study of Mazzini is often excellent on the personal side, and nearly always inadequate on the political side. What absorbs him is the prophet, the idealist, the moral regenerator. For Mazzini the conspirator who for thirty years was the terror of European governments and the marplot of every sane attempt to free Italy, he has only qualified enthusiasm. He sees Mazzini's mistakes, but he never shows their true relation to the evolution of the Italian cause, and he forgets that readers of Mazzini's biography have a right to know why it was that not only reactionary kings and cabinets, but devoted Italian patriots, the large majority of the men who finally created Italy, turned away from him.

The first impression one gets from Mr. King is that Mazzini's conspiracies were really unimportant, that the essential thing was his overpowering love of humanity, for which he sacrificed everything. Only when we have gone half-way through the book do we come on a passing reference to the "theory of the dagger," and to Mazzini's connivance in young Gallenga's purpose to assassinate Charles Albert. Mr. King dismisses both as if it were beneath an historian's dignity even to allude to them. To the expedition of the Bandiera brothers—whom he slurs as "sentimentalists and prigs"—he gives less than half a page, and in that he does not honestly state how heavy was Mazzini's responsibility; but to the opening of Mazzini's letters by the English Post-Office he devotes a page and a half. Yet historically the Bandiera episode was critical, because more than anything else it alienated the rising generation from Mazzini. Here is a leader, they said, who lures generous-hearted youths to their death while he stays safely in London, reminding his critics that no cause can prosper until it has had its martyrs. The implication that Mazzini spurred his disciples on to dangers which he did not dare to encounter himself was certainly unjust, but the fact that he utterly miscalculated the strength of the support which this attempt was to receive could not be gainsaid. Whenever he had an insurrection on foot, he saw myriads on myriads of friends rising at his signal, but the naïf Bandieras found not a dozen sympathizers ere they and their little band were betrayed and shot.

The established governments regarded Mazzini as we regard the practical Anarchist to-day—and, so far as his acts towards them went, they were not unjustified. So, too, were the great body of Italians who abandoned him after experience had taught them that, as a practical director of political insurrection, he was a mere will-o'-the-wisp leading to destruction. To bring these points out definitely was the first duty of Mazzini's biographer—a duty which Mr. King has not performed. Neither has he given a clear account of Young Italy, Mazzini's masterpiece of political propaganda; and when he comes to the Roman Republic of 1849, in which Mazzini had his one chance to display his talent as an administrator, Mr. King again misses his opportunity. His treatment of Mazzini's attitude towards the Piedmontese policy from 1850 to 1870 is wholly unsympathetic. He perpetually scolds Victor Emmanuel's Government for not allowing Mazzini to return to Italy—as if any Government is to be blamed for refusing to harbor persons who proclaim that they intend to destroy it if they can, and to set up one of a different kind. Let us be consistent: self-preservation is the first law of every government, no matter how bad it may be. But here, and indeed throughout the book, the biographer seems to forget that Mazzini's revolutionary plottings were not merely Pickwickian. They were transient, whereas the Gospel of Humanity still lives; but a biographer whose hero was both a discredited political sciolist and a noble prophet has no right to juggle with this dual nature so that the noble side alone comes into view. Mr. King admits the ineffectiveness of Mazzini's political intrigues, his lack of trustworthy information about the state of public opinion in Italy, his misjudgment of the Liberal Monarchists, to whom he attributed plans which they never dreamed of adopting; but, with an unlogic which is almost comical, he berates pretty nearly everybody—the King, Cavour, Garibaldi, Minghetti, and many more—for not accepting the leadership of the admittedly wrong Mazzini.

Mr. King's fundamental weakness is that he has never grasped the indispensable work of the Liberals in the redemption of Italy; so that in his criticisms he constantly reminds us of an anatomist who should try to set up a human skeleton without the backbone. He usually refers to Cavour in terms which might fit Jim Blaine or Joe Chamberlain; and except Ricasoli and Fanti—rather a strange choice—few actors in the *Risorgimento* get a good word from him.

A single quotation will show how unsound Mr. King is when he assumes the rôle of historian. After a cursory sketch of Mazzini's operations at Milan in the spring and early summer of 1848—operations which, he does not sufficiently state, tended all towards discord—Mr. King says:

> "Had Mazzini gone to Rome, he would have given a great impulse to the radicals and unitarians there. It would almost certainly have decided the Romagnuols; it would not impossibly have created such a force of opinion in all central Italy as would have overborne the autonomist parties and the King's [Charles Albert] own hesitations, and put all the Papal States and Tuscany under his suzerainty. Nay more, though the counter-revolution had triumphed at Naples, the nationalist elements were strong throughout the south, and had Mazzini organized them from Rome, and Garibaldi marched south in the name of Unity and Charles Albert, the work of 1860 might have been done twelve years earlier. Even had the bigger consummation failed, Mazzini could have forced the Pope to choose between a nationalist policy and deposition from his temporal throne; he would have thrown all the energies of the Roman Government into the war, and given Charles Albert another ten or twenty thousand men, enough to shift the scales of victory" (pp. 121, 122).

This is phantasmagoria, not history; it reads like one of Col. Sellers's prospectuses for Universal Eye-Wash. The wonder is that, having soared so far in cloudland, Mr. King stopped at all. He should have assured us that Mazzini and Garibaldi, having achieved these imaginary exploits in Italy, rowed across the Atlantic in a dory, landed at Charleston, and on New Year's Day, 1850, from Mr. Calhoun's front porch, proclaimed the abolition of slavery in the United States.

We regret to have thus to record the failure of Mr. King's biography of Mazzini on its political side, for it is time that the political Mazzini were adequately portrayed. The task should be done dispassionately, by some one who would hold up to view at any given moment not merely what the great conspirator was aiming at, but what his enemies thought he was aiming at; his misconceptions and theirs; and the real influence, to help or check, which he exerted on the Italian cause. Since Mr. King has not done this, it is a pleasure to be able to recommend that part of his book which concerns Mazzini the man and the prophet. Here Mr. King is on safe ground; he writes with the enthusiastic reverence of a disciple who has not forfeited his private judgment. He describes Mazzini's daily life so as to bring him before us in all his gentleness, his uprightness, his inflexible adherence to duty, his generosity, his charm. Especially vivid is the account of the terrible years between 1833 and 1840, when the exile had to bear not only hunger and cold, but regrets akin to remorse at the death of friends whom he had incited to conspiracy, and doubts as to the validity of his mission. Nowhere else in English has this been told so fully.

The last third of the volume Mr. King gives up to an analysis of Mazzini's religion, gospel of duty, views on the state, social theories, belief in nationality, and literary criticism. Mazzini wrote so much that to collect into a single chapter the upshot of his teachings on any one of these subjects, especially as he was not always consistent, required discrimination. Mr. King is right in emphasizing the religiousness of Mazzini's nature; from that sprang all his principles, and that gave intensity to all his actions. More than any other European of his time, his utterances had the "Thus saith the Lord" quality of the old Hebrew prophets; like them he was dogmatic, uncompromising, doctrinaire. He saw clearly that the new era on which mankind was entering called for a new religion which should satisfy men's souls as the old religions had satisfied men in other ages, and Mr. King has skilfully put together the various elements which Mazzini thought to be essential in the new faith.

In describing Mazzini's political and social doctrines, Mr. King candidly warns us that Mazzini based his conclusions on intuition rather than on exhaustive study.

The biographer, having himself a marked socialistic bias, discusses this part of his subject with unusual fervor, without neglecting those points (and they were many) on which Mazzini opposed socialism. Although his propaganda tended in every field—political, social, commercial, moral—towards collectivism, he always held a strong mental reservation in favor of individual liberty. He elaborated no consistent economic programme, but rather made many suggestions, which Mr. King sums up under two heads—"a radical reform of taxation, and the gradual supersession of capitalism by voluntary coöperative societies of workmen." To establish conditions in which each individual could reach the highest self-expression was his aim for society, just as he hoped to see each nation develop its individuality to the highest point, and thereby contribute its utmost to the commonwealth of nations. Nationality he regarded as an organ of immense importance, as necessary now for human progress as the ideal of the Church or of the Empire had been in other ages. He saw that the true foundations of nationality must be looked for not in geography, but in the deepest moral and spiritual elements—in common traditions, ideals, customs, hopes. One would like to know what forecast he would make, were he living today, of nationality in the United States.

Mr. King might have amplified his chapter on Mazzini's literary work without overestimating its value, for he was a critic of original force, whose essays on Byron, Goethe, and Carlyle, to mention only the best-known, have still to be reckoned with. We should lay much more stress than Mr. King does on the high literary quality of Mazzini's writings. Of all the European publicists of his century, not excepting Lamennais, he had style, and that will keep his best works alive for many a year to come. Scattered through Mr. King's book are quotations aggregating many pages, which of themselves would establish a reputation. "Where you cannot have victory," he wrote, "salute and bless martyrdom. The angels of Martyrdom and Victory are brothers, and both spread their wings above the cradle of your future life." "A nation's growth depends on the trust that other peoples place in it." "The artist is either a priest or a more or less practised mountebank." "Poetry is for me something like the third person of the Trinity, the Holy Spirit, which is action." "Art for art's sake" he branded as the "atheist formula"; and of spiritualism he said: "When men have ceased to believe in God, God pays them out by making them believe in Cagliostro or table-turning." Specimens such as these, taken at random, will give a hint of Mazzini's power of expression, which rarely flagged through nearly fifty years of continuous productivity.

Mr. King is fortunate in being able to print a sheaf of hitherto inedited letters. He also gives a bibliography of Mazzini's works, and of writings about him. The latter list is notably defective. In English alone we may cite four omissions: Mr. King makes no mention of Mr. R. M. Johnston's work on the Roman Republic of 1848, in which Mazzini's dictatorship is described in detail from an unsympathetic standpoint; nor of Countess Martinengo Cesaresco's pages on Mazzini in 'The Liberation of Italy'; nor of Mr. W. R. Thayer's chapters on Mazzini and Young Italy and on the events at Milan and Rome during the Revolution; nor of Mr. Marriott's admirable essay, from which a much truer idea can be had of Mazzini the agitator than from all that Mr. King gives. He is also ignorant of the German literature in this field.

But in taking leave of the book we wish to commend all save its political side to the new generation which knows not Mazzini. In his hatred of oppression, of luxury which enshrines selfishness, of what we now call imperialism—"I hate," he said, "the monopolist, usurping nation, that sees its own strength and greatness only in the weakness and poverty of others"—and even more in his refusal to admit that there shall be one moral standard for citizens and another for states, he has an urgent message to deliver in this day of reaction. And, finally, he has the gift peculiar to supreme guides of stimulating and uplifting souls that are in earnest with the great issues of life.

Euripides. Translated into English Rhyming Verse by Gilbert Murray, M.A., LL.D. Longmans, Green & Co. 1902.

Mr. Gilbert Murray, who until lately held the chair of Greek in the University of Glasgow, contributes this translation as the third volume of "The Athenian Drama" series. The translator is known to scholars as the writer of a short 'History of Greek Literature,' the brilliance of which was marred by a recklessly colloquial style; he has also written two plays, one purely modern, the other, the "Andromache," a curious attempt to reproduce in English prose and with the conventions of the English stage the effects of a Greek drama—without a chorus, which to Æschylus at any rate would have seemed little less strange than leaving out Hamlet.

The present series is advertised as "for English readers," and Mr. Murray, when he embarks on "a careful tracking of the spirit of Euripides" by means of the subtleties of the Euripidean language, proves a model of the Candid Translator. He does not hesitate to pit "Art" and the "spirit of Euripides" against the accuracy of mere scholarship, or to confess that, given the groundwork of a careful translation, he "thought no more of anything but the poetry." That is a perfectly admissible attitude, and it relieves the critic of a heavy weapon, if on the question of truth a translator declines to stay for an answer. The result in this case is a volume of amazingly good verse; lyrics that, here and there, could well be attributed to Mr. Swinburne, whose style they cleverly imitate; and a practical vindication of the rhymed couplet for the expression of the complexities of modern sentiment. It is Euripides brought up to date "with a vengeance," as Mr. Murray would say, but his English readers are to be congratulated, for here is a translator, one of very few, who can make the dry bones of a translation live; and, given a frank disregard of the letter, his "Hippolytus" and "Bacchæ" have a beauty and force unequalled in any other version.

These two plays may easily be translated more correctly; more beautifully they cannot unless Mr. Swinburne himself should undertake them. One only wishes that Mr. Murray would "Atticize a little," as Landor said of Browning. In saying this, we have in mind not only such expressions as "inspired damsels" or "Ho, varlets, loose the portal bars," or "a most black villain"; though these and their like, since they have other conventional literary associations, may possibly mislead the outsider who asks to envisage the color and atmosphere of Athenian stage dialogue as they are envisaged by the scholar.

A more serious question is whether the ideal translator will so far depart from the simplicity and restraint of the Greek that a reader who is familiar with the Greek text must constantly turn to the original to reconsider its meaning in the light of the English disguise. If we except Mr. Lang, who succeeds in being literal without baldness, we find among modern translators a tendency to excuse the freedom of their rendering on the plea that their English must be raised to a higher pitch than the original Greek. "I have often," says Mr. Murray, "used more elaborate diction than Euripides, because I found that, Greek being a very simple and austere language and modern English an ornate one, a direct translation produced an effect of baldness which was quite unlike the original." Translation is, of course, to a great extent subjective, so that every age must make its own translations of the Greek masterpieces, and every translator must lay stress on the qualities that appeal to his age, even as Chapman satisfied the soul of Keats. It is in fact quite conceivable that Keats would not have preferred Mr. Lang, who leaves so much less to the imagination. In his effort to appeal to his age and to make the most of the qualities in Euripides that will be expected from him by readers of Tennyson and Swinburne, Mr. Murray does indeed raise the pitch. We may compare a few passages in which the prose is literal Euripides and the verse is Mr. Murray's rendering:

> "Where a voice of living waters never ceaseth
> In God's quiet garden by the sea,
> And Earth, the ancient life-giver, increaseth
> Joy among the meadows, like a tree."

This represents: "Where ambrosial springs of water flow near the resting-place of the halls of Zeus, and Earth, sacred and life-giving, increases the blessedness of the gods."

A charming paraphrase of the gnomic refrain of a "Bacchæ" chorus is the following:

> "What else is Wisdom? What of man's endeavor?
> Or God's high grace so lovely and so great?
> To stand from fear set free, to breathe and wait;
> To hold a hand uplifted over Hate;
> And shall not Loveliness be loved for ever?"

which represents: "What is wisdom, what fairer gift of gods to men than to hold a strong hand over the head of one's foes? The beautiful is ever beloved."

Mr. Murray's

> "But sore it were
> Returning home to find his empty chair."

represents: "Yet sore grief would it be to me should he leave this house."

It is in the "Bacchæ" choruses that the translator's verse is at its best, and it would argue pedantry to demand greater literalness from a method that produces such a triumph of ornate English over austerity as the following:

> "Will they ever come to me, ever again,
> The long, long dances,
> On through the dark till the dim stars wane?

Shall I feel the dew on my throat, and the stream
Of wind in my hair? Shall our white feet gleam
In the dim expanses?
Oh, feet of a fawn to the greenwood fled,
Alone in the grass and the loveliness;
Leap of the hunted, no more in dread,
Beyond the snares and the deadly press:
Yet a voice still in the distance sounds,
A voice and a fear and a haste of hounds;
O wildly laboring, fiercely fleet,
Onward yet by river and glen . . .
Is it joy or terror, ye storm-swift feet? . . .
To the dear lone lands untroubled of men,
Where no voice sounds, and amid the shadowy green,
The little things of the woodland live unseen."

It is in this chorus above all that Mr. Murray finds the personal expression by Euripides, now safely in Macedonia, of the relief of escape from the fierce ambitions, the rivalries, the "arid irreligion" of that fourth-century Athens whose weaknesses were so unsparingly summed up by Thucydides—the Athens where "inferior characters succeeded best. The higher kinds of men were too thoughtful and were swept aside."

Mr. Murray includes in his volume a spirited translation of the "Frogs" of Aristophanes, which contains the classic criticism of Euripides. The English reader who can read his Aristophanes in Rogers would probably, like ourselves, have preferred a third play of Euripides. It is to be hoped that the translator will give us a second volume containing the "Medea" and the "Alcestis." To the three plays of the present work is added a useful appendix on the "Lost Plays" of Euripides, and a commentary with some discussion of obscure passages.

Light Waves and their Uses. By A. A. Michelson. (Volume III. of the Octavo Series of the Decennial Publications of the University of Chicago). Chicago: University of Chicago Press. 1903. Pp. 166. With 108 figures in the text and 3 colored plates.

Waves and Ripples in Water, Air, and Æther. By J. A. Fleming. E. & J. B. Young & Co. 1902. 12mo, pp. 299. With 85 figures.

Professor Michelson's book is devoted exclusively to an account of his own researches, the great importance and beauty of which are well known. This compact outline of them in a handsome dress will be welcomed by everybody who is interested in optics. This investigator's whole course of thought and of experimentation has been the logical result of his looking at the action of all optical instruments from the point of view of interference. We only wish that the exposition had been even more strictly autobiographical than it is.

Professor Fleming's little volume embodies six lectures delivered to a juvenile audience at the Royal Institution. Two are devoted to water waves, two to air waves, two to Hertzian and other ether waves. In the first two of these three divisions the author displays a charming power of making things plain. How, for example, a group of waves can have a velocity much less than that of any of the waves that compose it is rendered entirely obvious. Here, too, we find various most interesting observations which, though already printed, were novelties to us and are certainly not easily accessible, unless one is provided with files of such things as *Pearson's*, *Cassier's*, and *Harmsworth's Magazines*, of various technological periodicals, and of other sources to which there is no admission for any rational being except on business. But when he comes to Hertzian waves, Professor Fleming is seriously handicapped by two circumstances unfavorable to lucid exposition. In the first place, he is himself in the very thick of the struggle to advance this subject. We are aware that people who consider the matter hastily often reason that active investigators ought to produce the most easily comprehensible expositions, because clear thought always produces clear expression. But this reasoning involves two very false assumptions—that clear expression is the only thing required to render an exposition easily intelligible, and that those who first succeed in thinking out a problem think the solution in the clearest possible way. The truth is, that every invention, in its first workable form, is unnecessarily complicated; and that which is complicated is hard to understand, however clearly it be explained. But, in the second place, Professor's Fleming's mind is full of the new electron theory. Now this theory, at the present moment, seems to be somewhat in the condition of the Copernican hypothesis before Kepler. That is to say, it seems to offer an immense simplification in one respect, while it leaves the details quite as complicated as before, if not more so. These two circumstances appear to us to have decidedly weighted down the author's explanation of wireless telegraphy. We take the liberty of doubting whether the juvenile audience really understood it. At any rate, we are confident the matter might have been rendered more comprehensible without the sacrifice of any important feature.

Real Things in Nature: A Reading Book of Science for American Boys and Girls. By Edward S. Holden, LL.D. Macmillan. 12mo, pp. xxxviii, 443. Illustrated.

Most of the matters of common knowledge with which these pages are filled are such as we used to learn from six or eight different elementary treatises. They have stood the tests of time and usage, and are generally accepted as facts that every one should know. The book is constructed for youths of eight to twelve or fourteen years; its articles are short descriptions, explanations, or narratives on topics of Astronomy, Physics, Meteorology, Chemistry, Geology, Zoölogy, Botany, Physiology, and the early History of Mankind. The items are well selected, fairly well treated, and tolerably well illustrated; they are full of entertainment, and are easily verified by means of observation, experiment, or reference to literature. A mastery of the contents of the work will give a pupil an excellent start in the way of an education.

In general this reading-book is to be commended. There are cases in which the lettering of drawings is not clear, and some of the figures need retouching. On page 286 a peculiar knob or pompon stands up from the top of the skull of the gorilla, like the apple to be shot from the boy's head in the old story. The Bad Lands are illustrated in more than ordinary badness, on page 138, by having the picture placed wrong side up. On page 212, again, the toad and other objects are made to cast their shadows vertically upward. The prattle on Natural Selection might have been advantageously displaced by something less subject to criticism and better adapted to the class of readers using the book. Sooner or later pupils will learn, if they do not know already, that it is incorrect to say, as Dr. Holden does on page 262, "The dandelion bears a solitary flower at the end of the stalk."

Three Centuries of English Book-trade Bibliography, etc. By A. Growoll. With a List of the Catalogues, etc., published for the English Book-trade from 1595 to 1902, by Wilberforce Eames. 8vo, pp. 195, xv. New York: Published for the Dibdin Club. 1903.

Every studious reader discerns the value of an alphabetized catalogue with subject-index, as a guide to the book he seeks. The librarian, and perhaps the amateur collector of rarities, asks for more of detail; he wants to know the size and shape of a given book, when and where it was printed, with other information about author, printer, or publisher. It is for this class that the above work has been written and compiled. With Mr. Eames's addition, it is practically a catalogue of English catalogues of books. Yet it is not all dry reading, for it contains curious items about books and bookselling that will be of interest even to the cursory and careless reader. The growth of the curt catalogues first issued by German printers, the book fairs at Leipzig and afterwards at Stourbridge (near Oxford) in England, the Company of Stationers at London, the early English critical book-trade journals, the licensing of printed books, old book auctions, and book-trade bibliography receive brief but discriminating notice.

The real need of a book like this is fairly indicated by the steadily increasing estimates of the number of early books. Hain's catalogue warrants the estimate that at least six million copies of books were printed in the fifteenth century, but Van der Linde and Dziatzko give good reasons for the belief that the number in that period was about one-half greater. In the beginning, English contributors to bibliography were few in number. One curiosity is *Weekly Memorials* [not *Mementos*, as quoted by Charles Knight] *for the Ingenious* (London, 1683), the first critical literary journal in the English language; but its review of contemporaneous books is more amusing than instructive.

RALPH WALDO EMERSON.

"A pleasing photographic portrait is that of Emerson. The plate is large, about 13x16, and the bust figure is well set in this area.

"The poet is shown in post-meridian, but not in senile aspect, with a genial, relaxed expression, quite unconscious of posing for the camera.

"The portrait is an excellent one for private hanging or for the wall of the school-room, church parlor, or other public place."—*The Nation.*

For sale by F. GUTEKUNST, Philadelphia.

HOUGHTON, MIFFLIN & CO., Publishers

Charles Marriott made a name for himself with "The Column" three years ago. Julian Hawthorne, Senator John M. Thurston, Bliss Carman, and all the leading critics pronounced it a work of genius. The author's new novel is

The House on the Sands

Here Charles Marriott again proves himself one of the greatest writers of fiction of the day. The story is a powerful political one, and yet brings the reader, in its lyric moments, to the heart of nature. It is a novel of brilliant strength.

The Quaker: a Study in Costume

King Charles I. of England wore Quaker costume when posing for the well-known portrait by Vandyke. The beautiful Miss Fitzgerald, lady-in-waiting to Queen Caroline, also wore garments of Quaker cut. In both cases the Quaker element entered after the event, i.e., styles once worldly became Quaker by adoption.

The origins and transmutations of Quaker costume are entertainingly explained and freely pictured in this beautiful volume by AMELIA M. GUMMERE. 8vo, half ooze-sheep, 240 pages, 75 illustrations, $3.00.

SPECIAL ANNOUNCEMENT

To be published October, 1903

FATHER LOUIS HENNEPIN'S
"A NEW DISCOVERY"

Exact Reprint of Second Issue of 1698

With Introduction, Notes, and an Analytical Index

By REUBEN GOLD THWAITES

In Two Volumes, with fac-similes of original title-pages, maps, and other illustrations

IT is believed that *A New Discovery*—especially the second issue of 1698, which has been chosen for reproduction—is the most representative of Hennepin's works. It is a thoroughly readable volume, abounding in quaintly-phrased humor, satire, invective, and graphic description; adventures are related in almost every chapter; and through it all the man himself, a sorry braggart, yet never lacking courage, and possessing powers of keen observation, stands out in bold relief. As a human document, it has few rivals in our literature. Moreover, it is the only one of the Hennepin books now upon the market; Shea's *Louisiane* has for twenty years been out of print, and all of the original editions are rare and costly luxuries.

The work of editing this careful reprint has been undertaken by Reuben Gold Thwaites, who in addition to supervising the publication in every detail, furnishes a biographical and critical Introduction of some 9,000 words, copious Notes, and an analytical Index. Mr. Thwaites's eminence as an authority on all matters connected with the history of the West, and his well-known standing as an editor, will be sufficient assurance of the manner in which the enterprise will be carried out. Victor Hugo Paltsits, of Lenox Library, New York—one of the most expert of American bibliographers—contributes a new Bibliography of Hennepin.

There seems no doubt, then, that this beautiful, well-appointed, and well-edited edition of *A New Discovery* will at once be accepted as an interesting and very valuable addition to American historical sources, and will meet with the large sale which its merits so richly deserve.

The reprint will be issued in two square octavo volumes of nearly 500 pages each. The type used will be a large, clear face of pica old style, admirably adapted to the character of the work. Fac-similes of the title-pages of the original edition will be given, together with fac-similes of the seven full-page illustrations and the two large folding maps. There will be two editions: one in regular library style, on an extra quality of soft laid paper, gilt top, with uncut edges; and a special large-paper edition, limited to 150 numbered copies on the finest quality of Brown's hand-made paper.

Regular library edition, two volumes, in box, $6.00 net. *Limited large-paper edition, two volumes, in box, $18.00 net.*

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The NATION is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 206 to 210 Broadway, N. Y.

The Nation.

NEW YORK, THURSDAY, AUGUST 20, 1903.

The Week.

The belated and confused news from Bogota appears to signify the rejection of the canal treaty. In reality, it may turn out to be the Colombian way of advancing one step nearer its ratification. Minister Herran at Washington seems guardedly to take that view. So does the counsel of the Panama Company, not inexpert in the indirections of South American publicists. It was expected that the opponents of the treaty would make a great play for delay, and would assume temporarily defiant postures. This course has long been counted upon by the Washington Administration. But it has also been led to believe that, in the end and after many wry faces and impossible demands and despairing appeals, the treaty would be accepted. It may still reckon upon that result, for all that the latest developments actually imply. It has been well understood that the only real objection of the Colombian Congress to the treaty was that its terms were not as generous, pecuniarily, as would have been liked. All the talk about impaired sovereignty has been a blind. Colombian sovereignty was not impaired, strictly speaking, by the treaty, since there was no actual alienation of territory, and the United States was to acquire its rights over the strip by the canal under the form of a lease. But the thing that has rankled in the pure minds of the Colombians is the fact that a rich and lavish country, with a surplus of a couple of hundred millions in its Treasury, was offering them only a beggarly $10,000,000 when it might as well give $25,000,000. Indeed, we understand, they have really made it a point of honor with our Government, and consider that they are but flattering us, and paying a tribute to our magnanimity, by intimating that they are ready to accept a sum more consonant with our national grandeur.

From the army point of view, the retirement of Secretary Root will be a great loss to the service. There is a mistaken impression abroad that, because of the establishment of the General Staff, his work as a reorganizer is done. Such is by no means the case. Aside from the attention which the General Staff itself will need until it has had a practical trial, there is the whole question of the future of the old staff departments. There never was any good reason why the duty of supplying the army with food, pay, clothing, quarters, and cooking utensils should be in the hands of five separate departments, but it is, and each one of them is presided over by a general who goes his own way regardless of any one else. Common sense demands that these supply functions shall be in the hands of one set of officers, as is the custom in the navy. Mr. Root drafted a bill last year which was in the nature of a compromise, but its consideration by Congress was postponed until the coming session. This reform alone is almost as important as the creation of the General Staff. Moreover, the system of military education which Mr. Root has established still needs attention and further development. Finally, the service has not begun to settle down after its Cuban and Philippine campaigns, and to digest its unassimilated young officers who are only just learning the a b c of their profession, and who need careful weeding out. Along these lines there remains a great deal of constructive work quite worthy of Mr. Root's abilities. On the other hand, Judge Taft, if he should take the War Department, could be relied upon to deal with Philippine matters in a much better spirit, and would certainly be guilty of no such exhibition of petty spite as has marked the retirement of Gen. Miles.

The final withdrawal from active service of the navy's chief engineer, Rear-Admiral George W. Melville, merits greater attention than it has received. He was retired for age in January last, but was allowed to hold his office until the expiration of his term as chief of the Engineering Bureau, which occurred on August 8. This position he had held with satisfaction to the navy and the public for the unprecedented period of sixteen years, during which the new fleet has come into being. The transformation which he witnessed, and, to a large degree, guided, is comparable only to that which took place when sailing vessels gave way to steam. Under his direction have been not only the care and manning of these ships in commission, but the designing of the new ships. The visit of the *Kearsarge* to Europe has resulted in high praise of the ship's engine department and general mechanical arrangements, which seem to have impressed Germans and English where the appearance and discipline of the crew did not. Rear-Admiral Melville has possessed some rare qualities besides those of being able to recognize and employ capable assistants. He has, for instance, unlike most bureaucrats, been ready to admit his mistakes. He was the first officer to acknowledge that the amalgamation of the line and staff, which he favored, was a failure as matters are at present administered. Characteristically, he left office firing one more broadside at his brother officers who do not share his pet belief in triple screw warships.

The most serious scandal affecting the Government's relations to its Indian wards which has become public for at least a decade past, is now foreshadowed in the report of Samuel W. Brosius, general agent of the Indian Rights Association, in regard to land tenure in the Indian Territory. With the old stories of the cheating and robbing of Indians by white men we are all quite familiar; but that trusted agents of the Government, among them officials of the Dawes Commission, should be found to be profiting by other connections than those with the public service, is certainly startling. It was hoped that the spirit which animated the Beaverses and Machens of the Postal Department had spread into no other branches of the public service. Now it appears that most of the Federal officials in the Indian Territory were either stockholders or officers in a "Tribal Development Company" and a "Title and Trust Company" authorized to do business in the very lands which these officials, or some of them, were sworn to see properly allotted and distributed to the tribes which are rapidly being converted into American citizens. There is something radically wrong with our standards of office-holding when men of unblemished reputation like Inspector Wright could enter into such business relations even with the purest motives and best intentions. It is fortunate for all concerned that President Roosevelt has a personal interest in Indian questions, and is certain to insist upon a rigid investigation. In 1901 he removed Gov. Jenkins of Oklahoma after it had been proved that he held stock in a company furnishing supplies to Territorial institutions.

With Justice Brewer's belief that one desirable remedy for lynching is the abolition of the right of appeal in criminal cases, we cannot agree. Take the case of Molineux in this city. Convicted on his first trial, this man went free the second time he faced a judge and jury. Without the aid of the wrongfully introduced evidence of the first trial, the case against him collapsed. Yet he would have been done to death had Justice Brewer's plan of no appeal been the law. Before this change can be made, our judges of the lower courts must be of better stuff and freer from political influences. A comparison with English judges does not lie, but even if it did there should be some provision against human and judicial fallibility. By this we do not mean to say that there are no possible reforms in the procedure of our courts. President Roosevelt was right

in urging all possible expedition in criminal trials, but he would not advocate, we are sure, the breaking down of those safeguards with which our legal method of killing or punishing people has been hedged about by the slow growth of the common and statute law. Aside from this, Justice Brewer's strong words on lynching are most welcome. Like the utterances of Judges Woodward and Lore at Chautauqua, they are a fitting close to the public debate of the last few weeks in which the Chautauqua speeches have been so notable and valuable. With the strong statements of President Roosevelt and these judges on record, the "mighty fortress" of law and order is once more buttressed against its numerous enemies.

Such vigorous vindications of the sanctity of the law as Circuit Attorney Folk has been securing in Missouri have an indirect effect which is perhaps more far-reaching than their direct. Just now there are indications that St. Louis is about to abandon the policy of non-enforcement of excise laws so long in practice there, and which has earned for it the distinction of being one of the "wide open" towns of the West. The campaign has begun with the "wine rooms," which in St. Louis represent the means of approach to vice of all sorts. The old system was to permit these places to go on under the protection of the police and the politicians of the ward. Occasionally, when complaints grew too numerous, a license was taken away for a day or two, but it was invariably handed back again, either to the former proprietor or to his chief bartender. Now the wine rooms are being closed and kept closed in the face of all kinds of threats and protests. Another instance of the influence of Mr. Folk's crusade is reported by a St. Louis paper. A member of the municipal legislature was observed by a reporter at the ticket office in the railway station. "What," exclaimed the reporter, "you don't mean to say you pay your fare?" "Oh, yes, I do—now," replied the delegate.

John Wesley never seems quite so radiant as in Newgate jail preaching to the prisoners, and "Jersey justice" is never so awfully majestic as when it has corporation for its theme. The State is reputed a Botany Bay of shady corporations, and its courts get cases as delightful to the judicial mind as the most complicated bodily maladies are to the pathologist. Vice-Chancellor Pitney has fully lived up to his own opportunities and to the reputation of Jersey justice in the hearing on a receivership for the Universal Tobacco Company. As a matter of fact, the evidence of trickery in the formation of the company and in directors selling out their own stockholders was of a kind to provoke *obiter dicta* of a pungent kind. It may not have been narrowly judicial for Vice-Chancellor Pitney to berate the "tyranny of majority stockholders," and to allege fraud in the sale of treasury stock at absurdly low figures. But his outbursts expressed the natural indignation of an honest mind scandalized by irregularities which too many of us accept as the ordinary course of business. If such deliverances were commoner on and off the bench, there would be greater hope that delinquent States would be shamed out of the policy of seeking profit from the general demoralization of corporate business.

Through the repudiation of his recent strike orders by the Board of Building Trades, Sam Parks becomes a prophet without honor in his own country. It should be recalled that he was supposed to control the Board absolutely, and that on that account a number of the trade unions formerly represented have withdrawn, and are organizing a new central body. Apparently, then, Parks's formal support is reduced to that of his counsel in the extortion trial now proceeding, and of Devery, his bondsman. The particular action repudiated by the Board of Building Trades was Parks's triumphal progress after the first charges of extortion had been lodged against him. On that ocasion he led a band of walking delegates from building to building, and arbitrarily called out numbers of laborers who had returned to work pending the settlement of the dispute with the employers. Parks has the quality of inspiring fear among his fellows; he is perfectly capable of forcing the Board to vindicate him by rescinding its action. But the fact that they have chosen to reprimand him at a time when the courts are trying him for blackmail, shows that even his brother walking delegates are weary of his violent and unreasonable rule.

New York's Water Commissioner, Col. Monroe, is now able to report some of the results of the unremitting attention he has given to the question of water waste. To have reduced the daily use of water by 1,500,000 gallons—16,500,000, really, counting the normal increase—in a city which is growing so steadily as New York, is a remarkable achievement. It illustrates afresh the great benefits certain to follow a careful and scientific administration of any city department. This great saving of $803,000 a year—nearly one-half the cost of the entire Water Department payroll—has been made, not because of heavy outlays in improvements and new inventions, but by a careful study of the actual conditions and a stopping of the most noticeable instances of waste. It does not mean that there is nothing further to be done in this direction, or that Col. Monroe has reached the limit of his resources in getting a greater income for the city from the water which is actually consumed. If the right to instal meters in apartment houses, and even in private residences, were given to him, there would be further results of importance. Thus far Col. Monroe can boast of having saved to the city, or increased its income by, sums aggregating nearly three millions of dollars. Could the business men of New York ask any better proof of the fact that reform pays?

The *Evening Post* presents a striking parallel between the conditions at the port of Montreal and at New York. Export cargoes are plentiful at the former point; here the tramp steamer, the sure index of the state of trade, has almost disappeared, and the few which do frequent our port must remain here idly for days, perhaps weeks, waiting to be chartered. For the week ending June 20, 1903, more wheat went from Portland, Me., than from New York. Less than 260,000 bushels came this way for export, while more than 1,360,000 bushels went by way of Canadian ports and Boston. The same freight rates are offered by rail to Boston as to New York, though the distance is greater, and, besides this, free storage with insurance is provided in railroad warehouses at Boston. The rates to Philadelphia, Baltimore, Newport News, and other Atlantic ports south of New York are lower than to this port, the result of a traffic arrangement between the trunk lines. As to the decline itself, there is no possible doubt. The annual report of the Chamber of Commerce for the fiscal year ending June 30, 1902, shows that there was a total decrease in the foreign commerce of the city of New York, as compared with 1901, amounting to $43,198,000. The figures for 1901 show a decrease of $23,756,000 over 1900. Instead of sharing in the great increase in the nation's foreign trade, the port of New York has fallen behind. Meantime, Montreal's exports have grown from $32,245,941 in 1880, to $64,040,982 in 1899, and her imports from $42,412,648 in 1880, to $65,018,544 in 1899. From statistics compiled by the New York Produce Exchange we learn that New York's percentage of the total exports of flour, wheat, and corn, in bushels, fell from 56.3 per cent. in 1880 to 32.9 per cent. in 1899, while Boston in the same period of time increased her exports of flour, wheat and corn from 7.9 per cent. to 13.3 per cent.; Philadelphia, from 13.7 per cent. to 16.3 per cent.; Baltimore from 22 per cent. to 26.6 per cent.; Norfolk from 1 per cent. to 2.8 per cent., and Newport News from nothing to 8.4 per cent. Since these figures have been compiled, the decline has been even more striking.

The foundation of a school of jour-

nalism, which Columbia University has accepted, marks the most ambitious attempt yet seen to give the profession full academic standing. We have had "courses" in journalism and several so-called "schools," but nothing hitherto which aimed so proudly at making the editor's calling one of the learned professions. We should be the last to decry any plan to regularize and dignify newspaper work—least of all to make it more intelligent and conscientious; but the attempt to mark off a distinct journalistic discipline in a university seems to us bound to fail, in the nature of the case. To show this we have only to look at the tentative curriculum. It embraces work almost completely covered already by existing faculties. Courses in history, economics, languages, ethics, government, finance, diplomacy, statistics, etc.—all good and many indispensable for the journalist, no doubt, but all provided without the need of a separate school. President Eliot frankly states as much when he writes that if a foundation in journalism were offered to Harvard, the money could best be used in strengthening courses "already given at the University every year." The same must be largely true at Columbia. Special journalistic studies cannot be set off in a sharply marked school. They overlap the courses of general education at a thousand points. The analogy of the other professions breaks down the moment you try to draft a special academic training for the journalist. And, of course, the law of parsimony will prevent, in the long run, the duplication of work, in the name of journalism, already done elsewhere under the name of history, economics, jurisprudence, etc. There is, of course, a certain amount of journalistic technique to be mastered, but it is not great in comparison with other professions, and it may be gravely doubted if it can be successfully taught outside of a newspaper office itself.

By a curious and incalculable misfortune, the Parliament prorogued on Friday at Westminster is likely to get comparatively little credit for its imposing roster of new laws. Mr. Chamberlain's protectionist campaign has so much overshadowed other interests that the London Education bill, the Irish Land bill, and the ratification of the Sugar convention are already almost forgotten. Of the sugar and education laws it can only be said that Mr. Balfour pushed them through by a strict party majority, and against the convictions of many of his supporters. Indeed, until Mr. Chamberlain made his witty defence of the Sugar convention, the other day, the advocacy of all Government bills had been of a most languid sort. It is doubtful if laws so important have ever been passed under like conditions of public and Parliamentary indifference. Mr. Wyndham's land bill was an exception, so far as its passage in the Commons was concerned, and any Ministerial laurels clearly belong to him, even if the land-purchase law should fall somewhat short of his expectations. Mr. Balfour's attempt to suppress discussion of the Chamberlain plan by Parliament is an unpleasant episode of the session. It was the one subject that always elicited good debating beyond the little specialist groups interested in single bills. That Mr. Balfour comes out with his political prestige sadly damaged cannot be denied. The country is taking sides for or against Mr. Chamberlain's protectionism, and there is no lack of conviction on either hand. Mr. Balfour's open-mindedness already bears a comically belated look, and does him harm. But he cannot decide for or against Chamberlain without precipitating a party rupture and his own retirement. Under these circumstances, dissolution is highly desirable. It will become imperative as Mr. Chamberlain's aggressiveness widens the rift in the Unionist party. Whether the next session be long or short, Mr. Chamberlain will dominate it. He has made his individual conviction a national issue, and has staked the life of his party upon his being right. That is a remarkable achievement, if not wholly a creditable one.

Premier Seddon of New Zealand has been Mr. Chamberlain's right-hand man in the new protectionist campaign. Mr. Seddon now promises that his colony will follow the example of Canada and give a tariff preference unconditionally to the mother country. That would hardly advance the Imperial reciprocity idea in England. It would be taken as the sign that colonial loyalty is possible without the inducements which Mr. Chamberlain regards as indispensable. Protectionist leagues would point out the shame of receiving such favors without doing something in return; but a campaign cry of that sort would fall before the common-sense comment, frequently cited in Canada, that England should not repay concessions which cost the colonies nothing, by taxing her own food beyond her ability to pay. Everything that one hears from the colonies indicates that Mr. Chamberlain is most wise in refusing to give Parliament the proceedings of the conference of colonial Premiers. It is likely that this report contains some of the most trenchant criticisms of the whole reciprocity scheme.

We are informed in the dispatches that the appointment of a Russian viceroy for northern Mantchuria is a triumph for M. Witte's policy of peace. In the sense that a civil ruler may be less likely to give cause of offence than a military governor-general, that may be true; but it is also apparent that the appointment of an admiral-viceroy, exercising both offices simultaneously, might be taken as a sign that a forward policy is to be adopted. Certainly, the Japanese will have small cause to rejoice that the admiral who is a possible foe of theirs adds vice-regal to naval dignities. It should be noted also that, in setting up a viceroy, the Russians impose upon their wards of the Amur the only kind of authority fully recognized by the Chinese. In the imagination of northern China, this step should soon give the *de facto* Russian rule a *de jure* acceptance. It is unfortunate for those who see a pacific purpose in the change of government that the dispatches which tell of Admiral Alexieff's promotion also report the increase of the army of occupation. Nominally a leasehold from China, a large district of Mantchuria is now formally taken over as a Russian province. This makes for peace only on condition that China and Japan submit to the eventual extension of the new viceroyalty from the northern Amur provinces into southern Mantchuria.

The Berlin *Nation* has no difficulty in finding reasons why the Social Democrats increased their vote by 990,000 in the last election. In its issue of August 1 it tells the story of a postal official who rejoices in the name of Richard Wagner. In his leisure moments this young man gave much time to a study of the writings of Darwin, Haeckel, and Schopenhauer, with the result that he produced and published a satirical book called the 'Gospel of Contempt.' It is not asserted that this literary effort attracted many readers, but, unfortunately for the author, one copy fell into the hands of the Postmaster-General. That official concluded that Herr Wagner's doctrines were opposed to both morality and religion, and pronounced the author a "malefactor" deserving of punishment. He was formally notified that he had forfeited all right to promotion and also to any advance of salary in his present position unless it could be shown, when that advance became due, that he had not sinned again. He was also transferred from Cassel to Hanau, a much smaller town and office. Herr Wagner's reply to this was an official statement that he had joined the Social Democrats, for which offence he will probably be removed "for the good of the service." He will thus be made ineligible for any further Government employment, merely because he denies that the Post Office purchased his right to think upon literary and philosophical subjects when it hired his services. At the time the "lex Heinze" was under discussion in the Reichstag, Hans Delbrück asked whether the present reactionary tendencies would not cause "art and knowledge" to take refuge under the banner of the Social Democrats. There are signs that he was discerning.

SUICIDAL PROTECTION.

It is surprising that so little attention has been paid to the lessening turnover of capital in this country. The census figures show that there has been a striking diminution in the ratio between the capital of American manufacturing industry and the value of the product. The Census of 1880 reported 253,852 establishments, with an aggregate capital of $2,790,272,606, and with a product valued at $5,369,579,191. In 1900 the figures were 512,191, $9,813,834,390, and $13,000,149,159, respectively. The salient feature of this showing is, that while the capital employed increased 252 per cent. between 1880 and 1900, the value of the product increased only 142 per cent. Stated otherwise, in 1880 capital was less than 52 per cent. of the value of product, whereas in 1900 it was about 75½ per cent. In other words, in 1880 capital turned itself over nearly twice, while in 1900 the turn-over was not much more than one and a quarter times.

In running the eye down the detailed report of the various industries, one is impressed by the very general tendency of capital to reduce the ratio between itself and the value of the finished product. Take a few of the striking instances. In 1880, the brick and tile industry employed $27,673,000 of capital, and the value of the product was $32,833,000; but in 1900 the capital was $82,086,000 and the product only $51,270,000. Carriages and wagons produced $64,951,000, on $37,973,000 of capital in 1880, and $121,537,000 on $119,473,000 in 1900. Railroad and street cars turned out a product of $27,979,000 on $9,272,000 capital in 1880, and $107,186,000 on $106,721,000 capital in 1900. Cotton manufacturing did not turn its capital over even once in 1880; but it has done very much worse since. At the date mentioned its capital was $219,504,000, and its product $210,950,000; while in 1900 the figures were $467,240,000 and $339,200,000 respectively. Cutlery and edged tools employed $9,859,000 capital and turned out a product of $11,661,000 in 1880, against a capital of $16,532,000 and a product of $14,881,000 in 1900. In the case of fertilizers, capital was $17,913,000 and product $23,650,000 in 1880; these items being $60,685,000 and $44,657,000 respectively in 1900. Foundry and machine-shop products reported $155,021,000 of capital and $215,442,000 of product in 1880, and $665,058,000 of capital and $644,990,000 of product in 1900. Similar showings are made by glass and hardware, and, proportionately, a very much worse showing by glucose, malt liquors, and lumber and timber products. Paper and wood pulp, plated and britannia ware, typewriters and supplies, agricultural implements, and worsted and woollen goods fall into the same category. It is apparent at a glance that this list includes many industries which have come under the influence of the Trust movement.

Taking the Census figures as a whole, they indicate a marked growth of industrial competition in the United States. It would be futile, of course, to charge the whole of this movement specifically to the tariff; but to those who have studied manufacturing conditions in this country carefully for a long period of years, the undue influence of the tariff certainly stands out in strong light. The tariff has affected American industry at many points, some of which are too obvious to need mention, but others of which have failed to attract general notice. The paternalism bred by our tariff policy has put a premium on incompetency and extravagance. All manufacturers have not been characterized by these shortcomings; but the point is that the tariff, if we may judge it by its effects, has been framed to protect manufacturers with the minimum amount of skill and economy—the more efficient securing, incidentally, a better profit for the time being. It can hardly be disputed that the national policy has acted as a blight on industry as a whole, by producing a prosperity for its beneficiaries which really meant hardship for them in the end.

Up to a certain period the domestic manufacturer was subjected to a minimum amount of competition, by reason of the exclusion from the home market, through legal barriers, of the foreign producer. This naturally retarded the development of technical and commercial skill on the part of American manufacturers. The high profit realized under our paternalism reacted on industry, however, by diverting money in undue amounts to protected channels, and the point was reached some years ago when the manufacturers began to declare that it was not so much foreign competition that they feared as domestic. Foreign competition was facilitated by the extravagant cost of manufacturing here. Protection furnished such heavy profits at the start that the incentive to economy of operation was in large measure removed. Eventually, however, extravagant methods began to tell against our manufacturers.

It was easy come, easy go with American manufacturers, up to a comparatively short time ago, in the matter of profits. This fact created the loosest notions regarding the importance of writing off for depreciation. Charges to this account were, as a matter of fact, very inadequate. Old plants were not kept up to date; and, furthermore, every year subjected them to keener competition from new plants with the most modern equipment. Carelessness regarding depreciation was, of course, the result of over-eagerness for dividends. In the distribution of the profits of industry, comparatively little thought was devoted to the contingencies of the future.

As a result of these and other conditions, the manufacturing industry of the United States was brought to a very uncomfortable pass within the last ten years. There was a widespread eagerness on the part of the owners of manufacturing plants to rid themselves of their responsibilities, and an effort was made to accomplish this end just as soon as money-market conditions righted themselves after the long period of hard times and free-silver agitation. The country was full of idle money, and great financiers were seeking new schemes to exploit. The result was the Trust movement. The tendencies leading to this movement were deep-seated; the specific form of the movement was largely fortuitous. In the light of what we have said, it is clear that the tariff was a leading and efficient cause. In this sense, too, the tariff has been the mother of Trusts.

A FRIEND OF THE MOB.

When Gov. Seymour addressed the draft rioters in this city as "my friends," he not only hurt himself terribly, but made the task of restoring order so much the more difficult. Mr. Graves of Georgia, in openly striking hands with lynchers and glorifying the mob, as he did at Chautauqua last week, certainly hurt himself, but, unwittingly, helped rather than hindered the creation of a better public sentiment. It is something to have a horrible example; and, to our mind, nothing about lynching is more horrible than the way in which it perverts the reasoning powers and dulls the moral perceptions of educated gentlemen like Mr. Graves. If the mania is going to seize upon such as he, if men of apparently sound and trained mind are to fall to shrieking with the mob, the peril of anarchy is more acutely impending than we had thought, and the duty of society to front it, by argument and persuasion where possible, by the gleaming sword of justice when necessary, becomes more solemnly imperative than ever.

Mr. Graves, it must be confessed, was not happy in the moment he chose for his apologia for lynching. If he had known that his address was to fall but two days after the President's letter had set public sentiment surging in quite another direction, he probably would have desired to avoid so unlucky an anticlimax. As it is, his views necessarily appear as if struggling to escape from under the Presidential extinguisher, and the widespread approval of Mr. Roosevelt's sentiments involves the repudiation of Mr. Graves. We already see the intelligence of the South disown its assumed spokesman; and indeed the

Southern newspapers and public men that have so handsomely endorsed the President, could not in consistency have anything but condemnation for the doctrines of Mr. Graves.

Amazing and atrocious as these seem to be, they are of value as revealing a state of mind. This is an important part of our problem. Mr. Graves, we have no doubt, feels as many do in the South—and apparently in some parts of the North—who have not the courage to utter their sentiments in public. There is such a thing as the psychology of lynching, which is most important for those to understand who would combat the evil. This mental attitude Mr. Graves illustrates perfectly. We see in him those evidences of obsession, of intellect submerged in feeling, of unreasoning dread, and of reaching out after impossible remedies which are displayed so clearly in the communities where lynching is common, and which seem to call for the aid of the alienist almost as much as for the intervention of the educator and the statesman.

Note how Mr. Graves impatiently sweeps away all experience in penology as well as the facts in the case. For him, Romilly never lived; and the classical experiments in reducing crime by making its punishment less terrible but more certain never took place. Nothing but lynching can stop rape, he maintains; and then admits in the same breath that not even lynching, in its most fearful and barbaric forms, does actually stop it. And not a word has he to say about the statistics referred to by the President, showing that more than three-fourths of recent lynchings were not for rape at all. To all these teachings of the past and these telltale facts of the present Mr. Graves seems perfectly indifferent. That merely shows how deeply he is involved in the almost pathological condition of mind which alone makes it possible to excuse lynching.

But even this impassioned champion of the mob as "the sternest, the strongest, and the most effective restraint that the age holds for the control of rape," has to confess his remedy by lynching a failure. He would have lynch-law written in the statute-books. He urges that lynching be made statutory. This is wild enough. To legalize anarchy in respect to one crime would only set it howling for the blood of every man whom the mob did not fancy. Mr. Graves would plunge us all back into savagery, and then have a legal tag fastened upon us saying that we were foremost in the files of time. But this madness he presently drops for a new one. Even his authorized mob of lynchers, he contends, cannot save the South, since it is only a "temporizing expedient," while "the logical, the inevitable, the only solution of this great problem of the races" is—separation!

Thus does Mr. Graves put himself out of the court of reason. Separation of the negroes from the whites, either by segregating the former somewhere in this country, or by shipping them to Africa, is the craziest notion out of the asylum. The colored population do not want it, and cannot be forced to it; nor do the white people want it. Let Mr. Graves ask the Southerners to give up all their black workmen, and see what would happen. They might be tempted to apply his doctrine of the mob in a way highly inconvenient to himself. No, our help does not lie in a revival of Colonization blunders and follies and hypocrisies, nor in any other far-away or fantastic remedy. All that we have to do is to put in force the ordinary principles of ordinary justice and humanity. Treat all criminals according to crime, not color. Make the ministers of the law swift and terrible. But let them move as promptly against the lyncher as against his victim. Give Governors and sheriffs and police captains a mandate to lay down their lives rather than let the mob usurp one function of the courts. And let us talk sense, look at all the facts, and be fair, never abating our determination to rescue the land from the bloody-minded but cowardly lyncher, and to treat him and every man who defends him as a public enemy.

THE MASSACHUSETTS CORPORATION ACT.

Many States have been overhauling their corporation laws. The tendency shown has been distinctly toward a more liberal theory of organization, accompanied, however, by greater care to provide for adequate though not exorbitant taxation. Nowhere has it been more evident than in Massachusetts, whose legislation affecting corporations had, until this year, been characterized by severe conservatism. Down to 1901, Massachusetts corporations were not permitted to issue preferred stock. Prior to the enactment of the present law, no corporation could begin business until its entire capital was fully paid, in cash or its equivalent, and the approval of the Commissioner of Corporations obtained. This was no mere formality. Directors, and even stockholders in many instances, were held liable for the debts. The organization tax was high and the strictest form of accountability was required.

The theory was, that, by refusing to grant corporate charters based on minimum requirements, as in other States, the corporations of Massachusetts would acquire a peculiar credit, and Massachusetts charters would be sought as guarantees of stability. Experience, however, proved that these motives, operating perhaps on a small scale, were generally overruled by the desire for greater laxness. As a result, business in Massachusetts was being largely conducted by foreign corporations. These could not be controlled or adequately taxed. This lesson was finally taken to heart, and the Massachusetts corporation law of 1903 followed.

Its fundamental idea is that, without fraud, a corporation is entitled to the same freedom of action as an individual, together with such limitations of liability as will encourage industrial development. The departure from the old view was radical. The first step was to abolish the limit of capitalization, both in amount and in proportion to the net tangible assets. It was believed that these restrictions had much to do with the admitted arrest of corporate growth in the commonwealth. The stockholders and creditors of the corporations, who previously had been treated almost as if they were wards of the State, were by the new law left to form their own estimates of the solvency of the concern; the State, however, continuing to insist that the creditors and stockholders be precisely informed as to all matters relating to the organization or management of the corporation. The State itself no longer undertook to pass judgment. Similar reasons caused the abandonment of the provision of the old law requiring all capital stock to be paid for in cash or its equivalent. Now the stock may be paid for in cash, tangible or intangible property, or in services.

The directors, instead of the Commissioner of Corporations, become the sole judges of the value of the property against which stock is issued. The commencement of business no longer need await the paying in of all the capital. Good will, which was not formerly recognized as an asset, may now be counted with the property upon which stock issues are based. Lists of stockholders, formerly open to public inspection, are now withheld, to be produced only at the direction of a competent court. The cost of incorporating is reduced one-half. At the same time the provisions relating to foreign corporations are somewhat increased in severity. The incorporation fee is larger and the attempt is to tax the entire capital stock, no matter what proportion of it is invested in Massachusetts, at the rate of one-hundredth of one per cent. This in itself will be an interesting experiment to watch. When a like provision was talked of in this State, we were told that reprisals in other States against our own corporations would surely follow.

Great pains were taken in preparing the taxation features of the new law. Corporations are to be subject to two forms of taxation—one local, the other by and for the benefit of the State. The local tax, assessed by the cities and towns, is on real estate and machinery. The State tax is on all other net assets. It is assessed by a State Tax Commissioner, and is, in substance, a tax at the State rate upon the fair cash value of

the shares of the corporation, deducting therefrom the assessed valuation of the real estate and machinery locally taxed. The State tax rate in Massachusetts is usually about 1.60. The maximum amount of the State tax on any corporation cannot exceed a tax levied at the general State rate upon a sum 20 per cent. above the amount of the local valuation, plus the value of merchandise not locally taxed. On the other hand, the amount of the State tax levy must not be less than one-tenth of one per-cent. of the par value of the capital stock.

Information for the use of stockholders and the public is provided for by a section of the new law requiring every corporation to file annually with the Commissioner of Corporations a report containing the name of the corporation, the location of its principal office, the date of its last annual meeting, the total amount of its capital stock, the amount issued and outstanding, and the amount then paid thereon, the class or classes into which the stock is divided, the par value and number of the shares, the names and addresses of all the directors and officers of the corporation, and the date when the term of office of each expires, together with a statement of assets and liabilities. This report is to be at all times subject to public inspection.

Time and actual operation will be the best commentators on the new law. It is a significant and not wholly reassuring sign of the times that Massachusetts should have departed from her immemorial policy, plausible as may be the reasons assigned for the step. Already there are protests against her having even appeared to go into the competition for corporation charters and resultant corporation revenues, at a possible expense of stability and safety. One county judge has said that, if New Jersey is the mother of Trusts, Massachusetts is aspiring to be their stepmother. In the absence of uniform legislation, one State can, of course, do but little to enforce the stricter view of corporation laws. As for Massachusetts, the deciding argument for her appears to have been that, under the old law, her chief corporate business was transacted by foreign companies which she could neither supervise adequately nor tax as she wished.

ALTERING WORKS OF ART.

Mural painting is in many aspects a business, involving large provision of credit, capital, underwriting even; but, unluckily, it is a new business in this country, and so unprovided with legal precedents. We believe that the matter comes for the first time before the courts in Mr. Dodge's successful petition for a preliminary injunction restraining an architect from altering certain panels without his consent. These depicted scenes in Canadian history, and were furnished by Mr. Dodge, acting, as is customary, under contract with a firm of decorators, for a Toronto hotel. The preliminary sketches had been approved, but the architect was dissatisfied with the finished work. He therefore asked that certain changes indicated by him be made—a request which Mr. Dodge refused. The architect then declared that he would have the changes made by another hand. In the hearing on the preliminary injunction, two sharply opposed views appeared. The architect and the contractor asserted that the purchase of a work of art was like any other purchase. The buyer had the right to do what he would with his own, for the sale was unrestricted. The painter naturally held that the sale was made on the implied condition that the work of art should remain as it left his hand. He brought up pertinently the analogy of books, which may not be added to without the author's consent. In other words, Mr. Dodge maintained that a work of art is practically sold in trust, subject to its proper maintenance as an authentic product of the artist.

Without touching upon the merits of the present case, much obviously is to be said for the view that the artist parts with control. There is a certain brutality in the view that a purchaser of a canvas may cut it up and sell the pieces quite as if he were turning acres into town lots; but such an attitude has the advantage of simplicity and of consistency with the general laws of buying and selling. In particular, it should be said that an architect has and should have autocratic power over all materials to be used in a building under his control. He may tear down lath and put up marble quite regardless of the feelings of the lathers. Unquestionably, he may use his power oppressively; but when he replaces painted canvas with stucco, or alters the colors of decoration, he is well within his rights. In commercial decoration, for example, he could arbitrarily transpose the colors of walls and ceilings, and the decorator, who in his way might be an artist, too, would have no grounds of complaint. In the case before us Mr. Dodge is treated quite on this basis—as a decorator whose work must, either by himself or another, be made to meet the architect's requirements. It is a question not of æsthetics, but of rights. The architect may be wofully mistaken in his artistic judgment, and yet perfectly right in asserting his authority. Contrariwise, Mr. Dodge's decoration may be sadly amiss, and yet he himself be impregnable in his *ne varietur*.

We believe that the courts will follow the precedents already established in France, and lay down the principle that an artist's work has at least the immunities accorded to empty cigar boxes. How much damage might be done to an artist by allowing his work to be altered, finds illustration in a familiar anecdote in Vasari's 'Lives of the Painters.' On one occasion, he relates, Botticelli's rather stupid assistant, Biagio, had painted a Madonna surrounded by eight angels. The master, taking advantage of the absence of his disciple, pasted over the angels' heads eight caps, in paper, such as the citizens of Florence then wore. That travesty of his angelic choir brought Biagio to confusion. Now imagine such a deformation of a picture not done temporarily as a joke, but effected permanently. Evidently the ridicule and discredit attaching to such a pictoral monstrosity would injure the artist in his feelings, and even in his professional reputation. Especially is this true of decorations which are always on exhibition; and while it is not probable that Mr. Dodge's architect means to put fools' caps on the Hurons in the panels, he may be planning an improvement that would be only less distressing to their creator, and equally damaging.

Beyond these personal considerations, there is in any alteration of a work of art a potential fraud. A painting should not be confused with anonymous handicraft. It bears an artist's name and is known as his. When the work is changed by another it virtually ceases to be his, and if it be sold as such, or without notice of the alterations, the work becomes to all intents and purposes a forgery. Theoretically, perhaps, a fantastic collector would be justified in painting Worth gowns on Millet peasants, but we believe that in France, where the laws are more advanced in these matters, he would not be allowed to exhibit the picture publicly or to let it leave his hands as a Millet. And such action would be taken rather in the interest of Millet's great name than in that of the ingenuous American collector.

History, perhaps, does not justify the hope that the artist's right in his own work will be fully respected. It will be recalled that a Cupid has been painted out of the Dresden Venus of Giorgione, while horses were painted into Dürer's portraits of the brothers Paumgärtner. The authorities of the Munich Museum have, after nearly three hundred years, removed the horses; no Pope has yet ventured to undo the work of Michelangelo's "Breeches Maker" in the Sistine Chapel. For many generations it was a regular practice of curators of museums to piece out small canvases and panels, which thus gained what is technically called "importance." To-day we are carefully removing the work of those picture tinkers—though, alas, that is frequently impossible. It is not likely that an age thus solicitous for the fame of artists long dead will allow the work of living artists to be tampered with. In case of dispute, we feel, a work of

art must be accepted or rejected, and the artist must be the sole judge of the desirability of alterations. Otherwise we should be allowing to committees of aldermen the right to add or subtract the proverbial inch when they are dissatisfied with the proportions of a sculptured hero's nose.

THE IRISH LAND BILL AND THE ROYAL VISIT.

DUBLIN, August 1, 1903.

The relations of imperial to local finance in the British Empire are based upon no settled principle, and become increasingly complicated. It is "pull devil, pull tailor," and the weakest to the wall. This is especially so concerning Ireland. A few years ago, as most will remember, a commission, appointed by Government, unanimously reported that she paid £2,500,000 per annum more than her fair share. That figure has since perhaps been doubled, yet there is no apparent chance of justice being done. Sums in excess of those required for imperial purposes are drawn into the imperial treasury and then doled out as best suits the Ministry of the day. There are British funds and Irish funds earmarked for particular purposes, and then applied otherwise. The policy doubtless is to train the minds of all subjects to look to London. It is a wasteful, demoralizing system. The general public has no clear idea as to whether the money spent around them for public purposes is being drawn from their own town or district, or from the imperial exchequer. To this fiscal confusion in Ireland is added the effort in legislation to guard every interest, and trust nothing to the healthy action of fair administration and public opinion. On all these accounts there was seldom if ever a more complicated measure than the Land bill now before the House of Lords. As modified by the Irish party in committee, it is accepted by the majority as a beneficial, far-reaching measure as has been no other bill since that for the disestablishment of the Church. On the other hand, it is denounced by some of the most stalwart land reformers in Ireland as a betrayal of the tenant's cause. Mr. Davitt lately discussed the realities of the measure as contrasted with the jubilation over it in a communication headed "Facts and Flapdoodle." In to-day's *Freeman* prominence is given to a letter by Mr. Kettle, a well-known land-reformer, in which he writes that if a certain clause (which there is no chance of the Lords inserting) is not added, he has "no hesitation in saying that it will prove to be a curse instead of a blessing to Ireland." Mr. Sexton (as influencing the *Freeman*, of which paper he is chairman) and Mr. Dillon evidently regard the measure with considerable coolness. The settlement, in so far as it is a settlement, falls far short of what was at one time hoped and expected. However, some settlement is better than none. It would be difficult to appraise the economic loss consequent on continued agitation. As measured by annual rental, a few years more or less paid for the fee simple will be of small account compared to the advantages likely to be derived from a sense of ownership.

The acclaim with which in free countries a monarch is received is generally regarded as a measure of the degree in which subjects are satisfied with the institutions under which they live. It would be easy to misinterpret the reception accorded to the King and Queen. We must take into account the crowds of visitors, the feverish anxiety of the official classes and the "loyal minority" to put themselves in evidence, displays from business considerations, and the natural desire of a people to see a live King and Queen, and their readiness to be amused with brilliant military and other displays in lovely weather. The native masses were not particularly enthusiastic. Decorations were strikingly absent in the streets inhabited by those whose votes weigh most at the polls. There were in the South and West few addresses from representative bodies. An able weekly separatist paper, the *United Irishman*, enjoying a considerable circulation, has for some weeks devoted its columns to ridiculing, belittling, and condemning the demonstrations connected with the visit. Yet, when all is said, the reception was remarkable, showing a change in public feeling from that existent during the Queen's reign. This change was most apparent in the bearing of the Catholic Church—perhaps not uninfluenced by the hope of favors to come; and we cannot but recognize the tendency in these countries, in the effort to conciliate Catholic peoples, to concede to the Catholic Church favors accorded in few Catholic countries. For the first time in fifty years a Catholic archbishop has paid homage to a monarch at Dublin Castle. As for the King and Queen themselves, they did all in their power to attach public feeling—visiting hospitals and the dwellings of the poor, cancelling an engagement to appear at a theatre and donning mourning on receiving the news of the decease of Leo XIII. Stage and other estimates of our character must surely be modified now that King Edward has spoken of the keenness of our intelligence and "the warmth of our hearts." Upon what excuse hereafter can rights conceded to other peoples in the empire be refused us?

What this all portends as to future agitation it is impossible to predicate. A Protestant people denied rights of local government as strongly desired as Home Rule is supposed to be by the Irish people, would never have accorded even such a reception as has taken place here; or at least the protesting element would have been more in evidence. The course of events in Ireland was never more difficult to guess. In a certain sense all is again "in the melting-pot." The disappointment is bitter of those who, still believing in some form of Home Rule as desirable, gave themselves to the agitation a third of a century ago, believing it would be steadily pushed forward and would gather strength as did the Reform and Anti-Corn Law agitations in Great Britain, and the Anti-Slavery agitation in the United States. Some inimitable utterances by "Mr. Dooley" anent the Dreyfus case and the manner in which the French turn from one excitement to the other, present themselves to my mind as often as I consider the many other panaceas for the ills of Ireland that here have protruded themselves in general estimation before the one supposed to be supreme. At the present moment a large proportion of the rising generation appear most interested in the Irish language as a means to "Ireland a nation."

It is not altogether to the discredit of Catholic peoples that religious considerations, as compared to political, weigh more than with Protestants. But Catholics cannot complain if consequently they find their progress towards political freedom more difficult; and Protestants who desire to help must prepare themselves for many disappointments. As to leaders, Ireland is beginning to find herself somewhat in the position of the Liberal party in England. The efflux of time has tended to break down the old standard-bearers, and few new ones show themselves. Mr. Dillon, Mr. O'Brien, Mr. Blake are in poor health. Mr. Sexton and Mr. Healy have practically retired. Mr. Davitt seems estranged. Mr. Redmond as a leader appears very much alone. Funds, though still generously contributed by many districts, do not, according to newspaper accounts, come in as freely as even a year ago. As much was contributed in "Peter's Pence" in the Diocese of Dublin upon one day a few weeks ago, as has been sent in in several years from the same district to the Irish League and party. Foreign contributions have very much fallen off. The generations that carried with them abroad experiences of the famine and ensuing clearances, and the bitter feelings existent before Disestablishment and Land Reform, are rapidly passing away. It is evident that the Parnell split, thirteen years ago, was used as an excuse for political inaction by multitudes who were in reality tired of agitation. There is an Irish party as closely united as there was before, yet few of the objectors on the score of disunion have come back. The continuance of an Irish movement depends upon the maintenance of an Irish party in Parliament. This hitherto has depended upon the existence of a widespread living organization throughout Ireland, and this again upon the desire for and hope of land reform. In the present temper of those who heretofore have voiced and guided Irish feeling, it is difficult to understand how for some time to come the United Irish League can be much more than an advisory body. It remains to be seen whether this will keep alive the enthusiasm necessary for the maintenance of a party, or whether to the same end there is sufficient desire in the country for Home Rule on its own merits.

D. B.

WHISTLER.

LONDON, August 1, 1903.

The first shock of surprise is over. There has been time to get accustomed to the thought that Whistler is dead. The first perfunctory notices have been rushed into the papers; here and there the rare appreciation by those who knew and felt the loss has appeared. Now, in the calmer moment that follows, it is interesting to sum up all that has been said and written, and to realize just how much or how little Whistler and his art are understood.

To me it is extraordinary to find how unwilling, even yet, the world is to acknowledge one of the few modern masters who, by less timid generations, will be ranked with the greatest of all time. In most of the notices published, especially in the Eng-

lish press, a few facts, usually wrong, have been stated; the familiar anecdotes, usually with the point blunted, have been told; the eccentricities of the man have been exaggerated, the qualities of the artist passed over as quickly as possible. Now and then it has been easy to read between the lines the spite of the critic who, having writhed under the sharp strokes of Whistler's wit, has bided his time until it was safe to pay off old scores. Almost always it has been only too plain to see the hesitation with which the writer has offered his praise. For though, at the end, Whistler triumphed; though the acknowledgment he received from all over the world forced the British public also to accept him as something more than a coxcomb flinging a pot of paint in its face, it is evident that the old distrust lingered, strong as ever, under a veneer of polite recognition. It seems as if the critics—those "ready writers," as Whistler called them—having found themselves once on the wrong side by their ridicule, are in fear lest, by unqualified approval now, they may find themselves there again and this time forever. They have not got over their old uncertainty as to whether he should be taken seriously or not. They remember his laughter and tremble, doubtful whether, after all, he has not left, with his work, a great jest as his bequest to the world. For the most wonderful thing, perhaps, in Whistler's wonderful career is that he, the most serious artist who ever lived, should have passed with his contemporaries as nothing more than a gay, irresponsible jester.

Of this seriousness, those who knew him and heard him talk, those who read his books and letters with understanding, those who looked at his pictures with intelligence, could never, however, have had a doubt. It was at the very root of the man's nature, of the artist's accomplishment. People were bewildered by his quick and brilliant witticisms, his amazing letters. They mistook for fun what was meant in all earnestness, for exuberance of spirits what was done deliberately and with a purpose. His weapons, his arguments, were not those of other men; that was the only difference. Whistler, as any one who reads may know, had an eminently logical mind, and every little word, every little letter, light as it might seem, was used by him as a means to the same great end. There are many who have criticised him for collecting his letters from the newspapers and publishing them in permanent form; even some of his friends at times have regretted certain encounters with the enemy they thought unworthy of his notice. But whether right or wrong in the choice of weapons with which he armed himself, he was always great in the object he had at heart, always consistent in his uncompromising belief and devotion to his art. His letters, his controversies, his newspaper correspondences, his 'Ten o'Clock,' his Catalogues, his 'Gentle Art,' his 'Baronet and the Butterfly' were so many records of this faith and the good fight he fought for it. And the care he gave to the least of his writings, the beauty of his style, the rhythm of every sentence, were so many proofs that art—the art of words as the art of paint—was to him sacred. Hitherto, most people have been preoccupied with the subjects of his letters and books, of his battles in print and his battles in court. But in the days to come, when the battles have no more importance, save that which he and his name will give them, his distinction as a writer of terse, musical English will be remembered.

It is, however, above all in his work as painter, etcher, and lithographer that he was most consistent, most logical; with every stroke of the brush, every line of the needle, every touch of the chalk, he confessed his artistic creed. It was the fashion at one time to reproach him with want of knowledge: he had not mastered the elements of drawing, the subtleties of form, it was said by those who could see but vagueness in the Nocturnes and but slovenliness in the Venetian etchings. In saying it, however, they showed how little they knew of his earlier work or how quickly they had forgotten it. The London etchings, done when he was a mere youth, when no doubt he was still thought a student, are simply marvels of the detail which seems to be what the critic who clamors so loudly for "drawing" demands. Who has ever drawn the picturesque, tumbled-down wharves and boathouses, the factories along the Thames, which he himself has immortalized in that memorable passage of the 'Ten o'Clock,' as he did? Here is no slurring over, no pretence of generalization as an escape from difficulties, no empty suggestion in the avoidance of fact. Everything is elaborated, carried out with a degree of minuteness the Pre-Raphaelites must have envied, and yet subordinated to the effect, to the composition as a whole—already the work of the master. And it is the same with the paintings. Look at the first pictures—"The White Girl," "At the Piano," the portrait of his mother. What shirking is there here, what hesitation, what timidity, what compromise? In all of these early paintings there is the sound, certain drawing that the great men of his generation were taught to look upon as the first essential, the basis of all art, just as Michelangelo declared it to be to the miniature painter, D'Ollanda, whose Dialogues waited until yesterday for publication. Courbet was probably the master for whom the young Whistler had most respect, by whom he was most influenced; and Courbet had pushed his love of truth, his belief in realism, almost to the verge of violence. At the Paris Exhibition in 1900 one felt nothing so much as this insistence upon vigorous drawing and exact rendering of detail in the early work of Manet and the others, whom, with Whistler, M. Duret, in those old days, introduced to the public as *l'Avant-Garde*—the advance guard of all that is sound and beautiful and great in modern art. It is because of their splendid drawing that these first pictures of Whistler's are the masterpieces that the few have always seen in them. It is hard to understand how any one can look at the graceful figure sitting "at the piano" and all the detail in the room, at the lace cap and the quiet old hands folded over the handkerchief in the portrait of his mother, and question his knowledge, his supreme mastery, of the subtlety of form. Where is subtlety if it is not here? These pictures are, indeed, as perfect as anything he ever painted, for, as he himself might have explained, there can be no question of degree in perfection.

But because of his complete knowledge, as time went on he was able, when his subject required it, to dispense with elaboration, with detail. Because they cannot see this detail, because they cannot count the windows and number the floors in every factory along the river bank, the critics cry out that there is no drawing in his Nocturnes; as if, had he not known just what to leave out, had he not solved for himself the problem of selection—one of the most difficult of all problems for the artist—he could have rendered the loveliness of the London twilight, the haunting beauty of the London atmosphere, which he was the first to reveal to the world. I sometimes wish I could have the critics with me at my window as I watch the London day fading into blue or opal mystery — into the fairyland of the Thames, where what seemed to me brewery and shotworks in the disillusioning light of the dull London sunshine, becomes palaces in the night; then they might realize the astonishing truth there is in the Nocturnes which they were too dense, and the artists too envious, to think anything better than the vaguest dreams—the most careless dreams—on canvas. And so with Whistler's later portraits: they became simpler because he knew, as the lesser artist never can know and the critic does not want to know, what is essential and how to leave out all that is not—a knowledge, it is true, founded upon genius, but developed only by the endlessly loving study and labor of the serious student of Nature.

In the same manner, he may have insisted less upon detail in his later etchings, in the Venice and Dutch sets. He hinted where before he had given a minute statement. But it was solely because what he had to say could be better said in this fashion, could not have been said at all had not his control over, his grasp of, the lesser facts been complete. I have hanging on my wall one of the London set, the "Chelsea," and one of the Venetian, the "Traghetto," and I cannot look at them without feeling how perfect each is in its way, how logically the later print is the result, the outcome, of the earlier. The lithographs all belong to the later period, so that all have the breadth more characteristic of this period. But from first to last, in everything he did, there was a seriousness, a quality, that should help the least intelligent to understand what he meant when he declared, to the scandal of the easily scandalized British public, that "there never was an artistic period"—that art knows neither time nor nationality, but is always the same, whenever and wherever it "happens," always immortal.

It is also with a desire to prove him superficial, not serious, that even the better-informed critics of the moment have pointed to a lack of imagination in his work. Imagination exists in the portrait of his mother; they cannot well deny it. But, discovering that his standpoint, his personal attitude towards his sitter or subject, was not exactly the same in the works that came after, they lament the loss of imagination, searching for ingenious reasons in his theories of art, his absorbed concern with pattern, to account for it; never having the perception to see that, as his subjects and sitters changed, so did his way of looking at them and rendering them—a proof really of imagination, not of its loss. Some

of the finest of his recent pictures have not been shown, but in his comparatively late etchings of the "Naval Review at Spithead," in his lithographs of people and places, in some of the exquisite marines he has exhibited in the course of the last ten years or so, there is as much individuality, as much originality of observation—and, as I say, this means imagination in the painter—as can be found in the early works which, rejected alike at the Salon and the Royal Academy, are now struggled for by collectors and dealers. Again, it is objected that he never had the vigor, the power to attempt a large composition in the manner of the Old Masters; that he might paint a portrait of a single figure, but could never design and execute a great group. Who, however, can say what he might have achieved had the conditions been different; had he, in his youth, like Velasquez, met a patron like Philip IV., and been given not only every opportunity, but every encouragement to do what he liked, as he liked, on as large or small a scale as he liked? Place Velasquez in the London of 1860 and 1870, and would the "Meniñas," the "Lances," the "Spinners" have been painted?

But there is no occasion to speculate as to what Whistler might have done. By his actual accomplishment, his work will live long after the petty criticism and ill-natured attacks of the critics, the stupidity of patrons, and the jealousies of artists have been forgotten. If I dwell upon these things now, it is only because it seems to me that for the moment, in the revival of old controversies and old stories, the one important fact, the greatness of Whistler, is being lost sight of; and we have not so many great men in our midst that we can afford to lose one of the greatest with indifference, almost with contempt. If Whistler was hard and unrelenting to those who offended him, it was only because he had the courage to be true to the faith that was in him. He was steadfast in his friendships as in his enmities—the reason why his charm as a friend was no less than his greatness as an artist. N. N.

Correspondence.

NEWSPAPER RESPONSIBILITY FOR LAWLESSNESS.

To the Editor of The Nation:

Sir: To what extent are the newspapers responsible for the prevailing spirit of lawlessness so forcibly condemned in your powerful editorial of August 6 on lynching? They certainly have contributed to it in various ways, and especially by sensationalism and by the reckless dissemination of false and pernicious ideas. Examples of the latter occur daily. My morning paper yesterday devoted five-eighths of its first page to reports of murders and other atrocities, and my evening paper warmed over the same dish, giving most harrowing details of one of the murders and adding matter which could not fail to be harmful.

The murder was committed by a jealous husband (one Ismond, a barber), who claimed that, on going home in the evening, he found his wife and his victim (a friend of his, named McLeod) sitting on the same sofa. Following are extracts from the report:

"Ismond is given a good character by the neighbors and by his fellow-workers. The neighbors seem to justify him. 'The only mistake he made was in not killing both of them,' said a gray-haired woman across the road, 'if what he suspected is true.' Even some of the police incline to the view that Ismond was, if not legally, at least morally, justifiable if he found the pair in a compromising position, . . . and the statement is openly made in the Central Station that Ismond appears to have struck where a blow was called for."

And to-day my morning paper quotes Police Superintendent Downey as saying: "As near as I can make out, Ismond was justified in his cause."

Could anything be better calculated than this to foster and encourage the spirit of lawlessness which is already so developed that it is to-day a great, if not our greatest, national peril? In thus reporting public sentiment and the views of the police authorities, it is assumed by necessary implication that a wronged husband is justified in killing; and that when, for any reason, a husband thinks he has been wronged, the proper thing for him to do is to promptly kill the suspected person, and afterwards find out through the medium of a murder trial whether his suspicions were well grounded. The great majority of those who read these accounts accept newspaper statements as authoritative, and many of them, especially the more dangerous ones, are greatly encouraged by such utterances to take the law into their own hands whenever they think that a wrong has been committed. The newspapers are now making laudable efforts to put down the prevalent spirit of lawlessness, but can they not render their best service in this direction by carefully refraining from utterances which encourage that spirit, and by severely condemning such utterances, especially when they come from police officers or others in authority? B.

Detroit, August 11, 1903.

THE FOURTEENTH AND FIFTEENTH AMENDMENTS.

To the Editor of The Nation:

Sir: In the *Nation* of the 16th instant (which reached me here only to-day), in the editorial article entitled "Judge Parker on the Fourteenth Amendment," you express the opinion, or rather, you make the statement, that, under the power conferred by the last section of the Fourteenth Amendment, though "Congress has never adopted the 'appropriate legislation' to carry out this part of the amendment"—that is, the penalty for disfranchisement prescribed in the second section—"it has full power to do so," and that this "admits of no doubt." I assume that the "power" here referred to is power conferred by the last section of the Fourteenth Amendment.

I have, however, just been reading in the Springfield *Republican* of the 13th instant an editorial article which, with confidence equal to yours, declares that, until the repeal of the Fifteenth Amendment, Congress cannot enforce the penalty for disfranchisement which the Fourteenth Amendment prescribes. The *Republican* quotes Mr. Charles A. Gardiner as holding the same view in his address before the Convocation of the University of the State of New York on the 12th instant.

There is, then, I will not say doubt, but difference of opinion, on the point. I have not seen Mr. Gardiner's address, but the *Republican's* argument is briefly this: that the Fifteenth Amendment supersedes the Fourteenth; that the Fifteenth Amendment prohibits disfranchisement on account of race, color, etc., which the Fourteenth Amendment did not do; that hence any act or action of a State done since the adoption of the Fifteenth Amendment which constitutes disfranchisement for the causes named, would be void as contravening the last-named amendment; that, being void, such act or action of a State would be of no effect and could not be made the ground of reducing the representation of such State, though this could have been done before the adoption of the last amendment. In other words, that the act of a State in making such disfranchisement would have to be regarded as valid in order to warrant the enforcement of the penalty prescribed in the second section of the Fourteenth Amendment.

The question is most interesting, and may be of great practical importance; but my present object is, not to discuss it, but merely to call it to your notice in the hope that you may discuss it or remark upon it.—Yours respectfully,

D. H. Chamberlain.

London, July 30, 1903.

[We do not feel sure that Mr. Chamberlain has correctly understood the *Republican's* article.—Ed. Nation.]

SUMNER'S METAPHOR.

To the Editor of The Nation:

Sir: In the proceedings of the Massachusetts Historical Society (second series, vol. 16) will be found an admirable paper of the President of the Society, Charles Francis Adams, read at the October meeting, 1902, as a tribute of respect to the memory of their late associate, Mr. Justice Gray of the Supreme Court of the United States. Speaking of the influence of that distinguished Judge, in the case of Juilliard vs. Greenman, which deals with the right of Congress under the Constitution to make paper money legal tender, Mr. Adams employs the following expression:

"To use the metaphor of Charles Sumner, the medicine of the Constitution was under these conditions pronounced its daily food" (page 262).

Sumner, it will be recalled, once introduced this phrase in a speech to great effect. For years I had supposed that the figure was original with the Massachusetts Senator. He must, however, have taken it from Edmund Burke, for the following sentence is to be found in the "Reflections on the Revolution in France" (1790):

"I confess to you, sir, I never liked this continual talk of resistance and revolution, or the practice of making the extreme medicine of the Constitution its daily bread" ('Burke's Works,' Am. ed. [1807], vol. 3, p. 79).

F. W. H.

Washington, D. C., August 11, 1903.

Notes.

Cleveland has made a conspicuous position for itself as a new centre of fine bookmaking and of large publishing ventures. The Imperial Press is the latest aspirant in the former direction, and has provided itself with a general supervisor, a superintendent, and an artist binder. It will begin with a treatise on 'Printing in Relation to Graphic Art,' by Mr. George French, issued in a limited edition, with "printed specifications detailing the processes employed and the material used." In the same city the Ormeril Company announces that, having bought of Messrs. Appleton their "Collection of Foreign Authors," it will greatly extend it by adding translations from the best modern writers of Spain, Italy, and other European countries.

Campion & Co., Philadelphia, will soon have ready 'The Life and Times of Thomas Smith, 1745-1809,' by Burton Alva Konkle. Smith was a Pennsylvania Member of the Continental Congress and a Justice of the Pennsylvania Supreme Court, as well as a leading surveyor of the Indian Purchase of 1768. The edition will be limited. Numerous portrait and other illustrations are promised.

Frederick A. Stokes Co. will be the American publishers of the series, entitled "The Story of Exploration," to be edited by Dr. Scott Keltie of the Royal Geographical Society, beginning with 'The Nile Quest,' by Sir Harry Johnston. An Arctic explorer's daughter, herself the subject of Mrs. Peary's 'The Snow Baby,' has written a book called 'Children of the Arctic,' to be brought out in the autumn by the same firm. Marie Ahnighito Peary is nine years of age, but her mother has lent a helping hand.

Doubleday, Page & Co.'s autumn announcements include a new Atlas of the Moon, by Professor Pickering; a 'Color Key to North American Birds,' by Frank M. Chapman; 'The Moth Book,' by Dr. J. W. Holland, with more than a thousand colored illustrations; 'American Masters of Sculpture,' by Charles Caffin; 'Driving,' a manual by Francis W. Ware; and Mme. Le Brun's Memoirs translated by Lionel Strachey.

'Fairy Legends of the French Provinces,' translated from the original, with an introduction by Prof. J. Franklin Jameson, and illustrated, is in the press of T. Y. Crowell & Co.

L. C. Page & Co., Boston, will publish 'The Cathedrals of Northern France,' by Francis Miltoun, with eighty illustrations by Blanche McManus (Mrs. M. F. Mansfield).

A 'History of Socialism in the United States,' by Morris Hillquitt, is in the press of Funk & Wagnalls Co.

Mr. Lewis Harman Peet, whose 'Trees and Shrubs of Prospect Park,' Brooklyn, we lately noticed, is engaged upon a work performing the same service for Central Park in this city.

Six more volumes of the "Fireside Dickens" have appeared (London: Chapman & Hall; New York: H. Frowde), viz., 'Martin Chuzzlewit,' 'A Tale of Two Cities,' 'Hard Times,' 'David Copperfield,' 'Dombey & Son,' and a group of Reprinted Pieces. We have already spoken of this unpretentious series as plain to the eye, inexpensive, and equipped with the classic original designs of Cruikshank, "Phiz," and others.

An interesting survival is Walker's 'Rhyming Dictionary of the English Language,' revised and enlarged by J. Longmuir (London: Routledge; New York: E. P. Dutton & Co.). The work is now more than a century and a quarter old, antedating Goethe's complaint of the multitude who "singen und reden"; but Dr. Longmuir's preface seems nearly as ancient, drawing examples from no Victorian poet later in emerging than Tennyson, and showing a marked preference for sacred poetry. One may not rashly deny that a poet of high degree would resort to a crutch like this, as in the stress of a sonnet, for example; but a rhyming dictionary is essentially for rhymesters. A curious plea for this one is advanced in respect to the assistance afforded in deciphering mutilated telegrams, and the Morse alphabet is appended as a means of detecting the probable source of error.

A somewhat exceptional value attaches to Professor Rhys-Davids's 'Buddhist India,' the latest addition to "The Story of the Nations" series (Putnams), from the fact that it is based largely upon data hitherto published only in monographic form. The picture of India drawn from Buddhistic records differs materially from that given by the Brahmans, and there can be no doubt that the former, utilized in this volume, is the more credible. The village, social grades, economic conditions, and religion, each receive a chapter in which the available facts are clearly and simply set forth. While offering nothing new to the specialist, the general reader will find this book a good guide to the understanding of the social condition of ancient India. A slip occurring at the outset (p. 2), to the effect that the existence of republics in India in the sixth century B. C. "has remained hitherto unnoticed by scholars," affects only Lassen and others who might protest. The author inveighs rather bitterly against the "supine and placid" English Government for its indifference to archæological investigation, and records the surprising fact that there is no chair of Assyriology and only two of Sanskrit in all England. The book is well illustrated, and has an incomplete index.

In a double volume (ix., x.) Dr. Rodkinson's translation of the Babylonian Talmud has now completed the section "Jurisprudence" with the tractates "Makkoth," "Shebu'oth," "Eduyoth," "Aboda Zara," and "Horioth." Of these "Aboda Zara," dealing with the whole subject of intercourse between Jews and idolaters, is by far the most interesting. It is full of the most curious scraps of twisted history and folklore.

The tenth volume of the 'New International Encyclopædia' (Dodd, Mead & Co.) extends from Infantry to Larramendi. It thus embraces a number of important articles, such as Insects, Insurance, Ireland, Iron (with various sub-rubrics), Italy, Japan, Jews, Knowledge, Labor (also with many sub-rubrics). All these rise to the level which may be fairly required, and the Encyclopædia as a whole is steadily improving and shows very much fewer of the remarkable weaknesses which characterized its early volumes. Yet they still appear sporadically. Sudermann's "Katzensteg" is dignified with eighteen lines; the Semitic proof-reading could be much improved; bibliographies—especially historical and geographical—are still too often lacking; and the illustrations are conspicuously, though expensively, inadequate. The maps are peculiarly poor; this holds, it is true, to a certain extent, of encyclopædic atlases in general. But these details must not obscure the patent fact of steady and great improvement.

An addition to our scanty stock of Hausa prose is a collection—seven pages only—of short pieces, descriptive of Hausa life, written by a Hausa and now edited with translation and vocabulary by W. H. Brooks and L. H. Nott ('Batū na Abūbuan Hausa,' Henry Frowde). The vocabulary is very elaborate in its exposition of Hausa usage, but makes absolutely no attempt at etymology. Thus the Arabic element is left undistinguished, a course which cannot but react upon considerations of even purely Hausa grammar. Further, points are left out, through this, which will puzzle the learner. For example: "Tūri Sinā" is reproduced in the translation "Turi Sinai," and "Tūri" is left unexplained in the vocabulary. Of course, it is simply the Arabic *Tūr*, "rock," always combined in Arabic with Sinai. That the kinship of another side of the vocabulary with ancient Egyptian is also left unnoticed is not so surprising. The subject is somewhat recondite, and a discussion of it would not be immediately useful. Nevertheless, scientific study of Hausa will undoubtedly have to reckon with it.

Volume XIX. of the "Monographien zur Weltgeschichte" (Leipzig: Velhagen & Klasing; New York: Lemcke & Buechner), is 'Die Deutsche Hanse,' by Prof. Dietrich Schäfer. It is an admirable study, in a short monograph, of the Hanse towns. The book is well illustrated, with photographs of paintings and statuary and of characteristic bits of architecture, and with facsimiles of charters and documents. It is a pity that we have nothing in English corresponding to these excellent monographs, and at popular prices. Several other volumes are advertised to appear in the near future, dealing with such a variety of subjects as the Romans in Germany, the false Demetrius, Maria Theresa, Napoleon I., and the history of the United States.

The numerous archæological finds in Vienna, in recent years, which have made clearer than ever the picture of the strong Roman frontier fastness at this place, have now been collected and scientifically arranged in the new Museum Vindobonense. For the present the collection has been placed in one of the public schools of the city, but a new museum building is to be erected in the near future. A special committee of the City Council has charge of these treasures.

Arrangements are being made to celebrate the first centennial of the Berlin University in 1910. Already in July, 1809, Frederick William III., at the period of the lowest political subjection of Prussia to Napoleon, published an order for the establishment of this institution, and on the 10th of October, 1810, the Secretary of Education directed the authorities to begin the matriculation of students. The exact day of the celebration is to be determined by the Emperor, but Professor Lenz, Dean of the Philosophical Faculty, has been entrusted with the task of preparing a history

of the University, and the new supplementary building projected will be seasonably completed.

In honor of the centennial celebration of the University of Heidelberg, already mentioned in these columns, two memorial volumes on the famous teachers of the Ruperto-Carola and their work during the past century are to be published by the house of Carl Winter. All the departments of the University will be represented, and the work will thoroughly exhibit the scientific work done by the oldest German university during the period in question. Sixteen of the Heidelberg professors have united in preparing it, and the general introduction is from the pen of Dr. Fritz Schöll.

In November of the present year the city library of Ferrara will celebrate the one hundred and fiftieth anniversary of its foundation. In memory of this the authorities have decided to publish in facsimile, under the editorship of Prof. Giuseppe Agnelli, its most famous literary treasure, namely, the autographic fragments of the 'Orlando Furioso' of Ariosto. The volume will consists of 53 sheets in 106 photographic plates, and will contain a portrait of Ariosto, after the original by Titian, together with an introduction by the editor.

It is in France that they know how to recognize distinguished merit with justice and without prejudice. Miss Jamieson, a Scotch woman, who took first-class honors last year at the University of Edinburgh and who holds the Heriot travelling scholarship given by that institution, has been appointed professor of the English language at the Grenoble University. The Rector of Grenoble first consulted the Minister of Public Instruction, M. Chaumie, in regard to this appointment, and it was consequently made with due form. Any one who has noticed how poor the English instruction frequently is in Continental universities will be glad that it has fallen in this case into presumably competent hands.

—In the midsummer number of the *International Monthly* the difficult problems that the charitably-minded are called upon to discuss in these days, before they can feel it safe to give way to their generous impulses, are ably handled by Professor Schwiedland and by Mrs. Helen (Dendy) Bosanquet. Professor Sanford, in his article on "The Psychic Life of Fishes," gives, as was to be expected, exactly the sort of discussion of an intricate scientific question that the layman needs to have, and points out in passing how wide is the field for experiment that awaits tilling in the whole subject of animal intelligence. Professor Ostwald succeeds no better in settling the problem of the universe in an article of sixteen pages than he does in his fascinating but unsatisfactory volume on 'Naturphilosophie'; and Mr. Guthrie, in "The Theory of the Comic," falls below the level of this Review in both the value and the dignity of his contribution—not to mention the correction of proof, as in "Zarathustra" of Nietzsche. The article that will appeal to the widest circle of readers is the sympathetic account of the life and work of Herman Grimm, by his niece, who was also his friend and correspondent, the Baroness von Heyking. Grimm was of an old Hessian family of Protestant clergymen, in which intellectual work was the tradition of centuries. His father and uncle, the brothers William and Jacob, were called from Cassel to Göttingen in 1829, at a time when that short distance seemed so long that they felt like strangers in a far country; Jacob Grimm's first lecture in the University was on the subject of homesickness. The brothers Grimm were of the famous "Göttingen seven," whose protest against the arbitrary abrogation of the Hanover Constitution by the new King, the Duke of Cumberland, led to their expulsion from the University and from Hanover—an event which is still commemorated in Göttingen by a modest monument. At the time, this heroic act aroused great enthusiasm, and the impression which it made on the young Herman, who was less than ten years old, was profound—he attributed to it his first historical convictions. It was through the efforts of Bettina von Arnim, with whom Frederick William IV. was on terms of friendship, that the two brothers were called to the Academy of Sciences at Berlin; at her house Herman was a constant visitor, first as a child and then as a young man, and her gifted daughter, Gisela, poetess and dramatist, became his wife.

—In the course of the operations of the Seven Years' War, three successive English expeditions were sent against the French position at the forks of the Ohio. To these expeditions and their consequences, both immediate and remote, are allotted three volumes of Mr. Archer Butler Hulbert's series of monographs on "Historic Highways" (Cleveland: Arthur H. Clark Co.)—Volume 3, 'Washington's Road,' Volume 4, 'Braddock's Road,' Volume 5, 'The Old Glade (Forbes's) Road.' Washington, in 1754, followed from Fort Cumberland to his encounter with Jumonville an Indian trail known as "Nemacolin's Path." Braddock, in 1755, took the same general route, constructing a rough but practicable road, which marked the course for the Cumberland Road, of vast importance to our title to and occupation of the West. "In certain localities this famed national boulevard, the Cumberland Road, was built upon the very bed of Braddock's road, as Braddock's road had been built partly upon the early Washington's road which followed the path of the Indian, buffalo, and mound-building aborigines. Nowhere in America can the evolution of road-building be studied to such advantage as between Cumberland, Maryland, and Uniontown, Pennsylvania." Forbes, in 1758, struck an entirely new line. Washington and the Virginians urged him to improve Braddock's road, but Bouquet pointed out that a more northerly route, through Pennsylvania, might be longer in opening, but would be much shorter in using. There was jealousy between Pennsylvania and Virginia, already disputing each other's rights in the West, for it was seen that the possession of the headwaters of the Ohio would most likely pass to the colony which gained the road. Forbes selected the Pennsylvania route, and Pittsburg became a Pennsylvania town. During Pontiac's War and the Revolution, Forbes's road helped mightily in holding the West, for "it was the one fortified route to the Ohio." In 1785 Pennsylvania laid out the Chambersburg-Pittsburg pike along its course.

—Our appreciation of this excellent series we have already expressed. The fine conception of increasing, it might almost be said of creating, our accurate knowledge of the channels in which the streams of our history have flowed, deserves more than passing praise. It is with the greater regret that the marked unevenness of execution is noted. The author is at his best, and his best is very good, when arranging evidence, tracing the course of a highway, and pointing out the causes of that course, with its results, military, political, and commercial. Unfortunately, he is not content to let his monograph be a monograph, but must needs interrupt it from time to time with pages of rhapsody and fine writing, in which probabilities and logic, as well as dates and other facts, are ridden over roughshod. The book would be stronger if most of these fine passages were relentlessly cut out, and the space gained used to increase the detailed study and compilation of facts to which the work owes its value. Somehow, the errors of statement gravitate to these irrelevant paragraphs. "The thin line of scarlet-uniformed Virginians" has a captivating sound, but what evidence is there of its existence? Whether red, blue, or nondescript their uniforms, it was not in 1753 that they yielded Fort Necessity. Jacques Cartier was at Quebec many times, but "in the year fifteen hundred and forty" he neither "raised at Quebec a white cross crowned with the fleur-de-lis of France," nor "set the tide of French trade and exploration—this tide of trappers, merchants, Jesuits, and adventurers—over the Ottawa rather than up the St. Lawrence," for he was safe at home in France all the year. The one he may have done in 1536, but the other was the achievement of another man in another century. "Gaelic" is a curious synonym for "French," and it may be to its subtle suggestions that we owe the substitution of whiskey for brandy in the list of articles of French commerce. Beaujeu had 880 men (vol. 4, p. 123) against Braddock's 1,400 (*ibid*, p. 130), and so in the death-trap by the Monongahela "that desperate handful of French and Indians put to flight an army of five times its own number" (vol. 3, p. 98). Is "Braddock's Grave," beside the road which Braddock built, the actual resting-place of Braddock? The author thinks he has "made it plain that this is not definitely known to be true," yet he says that the bones are "undoubtedly" Braddock's. The distinction is a very delicate one. The story of these expeditions and the roads thereunto appertaining would gain much in value and intelligibility if illustrated by a single good map of the territory, showing ancient and modern routes. We regret that these three volumes have not for a companion an account of the Iroquois trail through central New York and the expedition of Prideaux and Johnson against Fort Niagara. In the fight for the West the campaign was critical and decisive. In both aboriginal and modern times this pathway between the ocean and the lakes has had a singular character and importance. Together they should receive in a work of this scope more than the passing mention accorded.

—The sixth volume of the 'Writings of James Monroe' (Putnams) includes what Mr. Hamilton has found of his letters and papers from his inauguration in 1817 to his famous message of 1823. It must be admitted that the result is disappointing in

more senses than one. Apart from Monroe's letters to Jefferson and Madison, there is little that is new, and less that is either suggestive or important. A President's message is usually a composite work, built upon the suggestions of his advisers, and intended for political effect rather than as an enunciation of individual convictions. Monroe was not a very decided character save where his suspicions were allowed free play, and these formal state papers make dreary reading. Of Monroe's relations with the members of his Cabinet we see almost nothing, due largely to the fact that Mr. Hamilton has not gone outside of the Monroe collection in the Department of State. He prints only one letter to Calhoun, one to Crawford, a general letter to his Cabinet, and a single Cabinet memorandum. In the case of Adams, the result is somewhat better, for twelve letters are printed, although more than twenty times that number are available. The general meagreness of the volume is emphasized by the devotion of one hundred pages to papers (not Monroe's) bearing upon the message of 1823, which add nothing to what was already known.

—The most notable incident in this period, outside of the recognition of the South American republics, was the Missouri Compromise. It takes on a new interest because of the light it throws upon Monroe's capacities. Never a great man, he stumbled into the Presidency by sheer good fortune, and his rule is described as the "era of good feeling." It was not such from any act of Monroe, and the office, in place of broadening his mind, left it in all its petty meanness and extraordinary suspiciousness. This is shown in his view of the Missouri question. To him no moral question was involved—the right or the wrong of slavery, and the injury it inflicted upon the section of the country where it prevailed. He harked back to an old grievance, the Jay incident of 1785-6, and the proposition made at that time to yield the claim to a free navigation of the Mississippi. That proposition, in Monroe's opinion, was an effort to secure dominion for the Eastern States by dismemberment of the Union. Jay wished to make New York a New England State. The one attempt was frustrated by the self-sacrifice of some Southern members (meaning himself); the other, by the differences with Vermont on land grants. Then followed the "march to greatness" of the South, which the Northerners sought again to impede by the Hartford Convention and the proposition for restricting Missouri. All this is very silly, but it is illuminative of Monroe, who suffers not only in his own writings, but in the injudicious treatment of them by his editor.

—The Laws of Hammurabi, like 'Babel und Bibel,' continue to call forth an abundant literature. Unquestionably this code is the most important discovery hitherto made in Babylonian research. It is important not only in the study of the development of Bablonian history and culture, but also and primarily in the story of world culture. The three fragments of the stele containing these laws were discovered by De Morgan in Susa in December and January, 1901-02, and both the text (photographic reproduction) and a translation by Father Scheil were published with most commendable promptness in the fourth volume of the monumental Memoirs of the French expedition at the close of the same year, 1902. A translation into German was speedily issued by Dr. Winckler, with introduction and notes, published by the Vorderasiatische Gesellschaft as the fourth number of the fourth volume of its admirable series of pamphlets entitled 'Der alte Orient.' This translation, which was a decided improvement on the French translation of Scheil, has been made the basis of a second pamphlet, entitled 'Moses und Hammurabi,' by Dr. Johannes Jeremias, in which the latter undertakes to analyze the code and compare it in detail with the Hebrew laws, and especially with the oldest code of those laws contained in the so-called Book of the Covenant (Exodus xx.-xxiii.). Striking are the points of resemblance brought out by this comparison, but almost equally striking are the points of divergence. Jeremias, claiming Hammurabi as an Arab of an Arabian dynasty which had conquered Babylon, concludes: "We have, therefore, ground for the hypothesis that traces are found in the old Arabian right and use which point to a common tradition for both Moses and Hammurabi, having its origin in Arabia." To us it seems rather that his evidence would point to a secondary derivation of the Hebrew from the Babylonian law through the medium of the Canaanites, who were, for many centuries, as Jeremias points out, under Babylonian rule or Babylonian influence. Hammurabi's laws have been translated into English by C. H. W. Johns, Lecturer in Assyriology at Queen's College, Cambridge, under the title, 'The Oldest Code of Laws in the World' (Scribners). Of this translation, altogether without note or comment, we have already spoken. In the preface, Mr. Johns says that Winckler's translation came into his hands after his work had been sent to the publishers. It is a pity that he could not have had the advantage of that translation for comparison. His own leaves much to be desired, and is by no means so good as the English translation, based largely on Winckler's, which was published by the American scholar, Dr. William Hayes Ward, in the *Independent* some months since.

—The excitement produced by Delitzsch's lectures on 'Babel und Bibel' continues in Germany, and produces a constantly increasing number of pamphlets dealing either directly with Delitzsch's discussion or with Babylonian explorations and their bearings on the Bible. Among the pamphlets published by the Vorderasiatische Gesellschaft in 'Der alte Orient' series, in its second volume, was one entitled 'Biblische und Babylonische Urgeschichte,' by Prof Heinrich Zimmern of Leipsic. This has now been issued in a third (revised) edition, under date of 1903, to bring it abreast of the present discussion. Dr. Winckler has also issued a pamphlet entitled 'Abraham als Babylonier: Joseph als Aegypter,' in which he attempts to prove that the story of Abraham in the Bible indicates a consciousness on the part of the Israelites that their religion had its origin in Babylon before the reforming efforts of Hammurabi. Abraham represents the purer, more ancient religion, which, finding the reforms of Hammurabi incompatible with its practices and aspirations, migrated westward. Joseph is supposed in the same way to represent those monotheistic and Asiatic tendencies which showed themselves in Egyptian religion in the time of Amenophis IV., and is practically identified with the Janchamu whom this king appointed as his representative or viceroy in the delta of the Nile, the granary of Egypt. The overthrow of Amenophis's dynasty and religion after his death under the lead of the priests of Thebes ushers in the oppression of the Israelites under the new Pharaoh in Egypt. Winckler's views are somewhat fanciful, and not altogether free from the suggestion of theological motive.

EGYPTIAN LIFE UNDER THE PTOLEMIES.

The Tebtunis Papyri. Part I. Edited by Bernard P. Grenfell, D.Litt., M.A., Arthur S. Hunt, D.Litt., M.A., and G. Gilbart Smyly, M.A. Oxford University Press; New York: H. Frowde. 1902.

The source of this bulky volume of 674 pages was most whimsical and unexpected. The papyri which are here deciphered and interpreted were derived exclusively from the wrappings of mummified crocodiles unearthed in the Fayûm about three years ago. This mummification was the work of pious votaries in honor of the crocodile deity, Sobk, worshipped throughout the Arsinoite nome. A good-sized crocodile of three or four metres in length requires a wrapping of corresponding size. Hence these papyri are unusually large, many containing one or two hundred lines, while the longest is exceeded only by the Revenue Papyrus of Philadelphus. As a matter of convenience the crocodiles are numbered, and the provenance of MSS. indicated accordingly. No. 27, the most literate of these animals, furnished about two-score distinct documents. The dates of these are, in the main, exactly determined, and they range from 120 to 56 B. C.

The chief value of the present volume (which is shortly to be followed by two others) is to illustrate the economic and, to some extent, the social conditions of Egypt within this period; and for this purpose it is a collection of capital importance. It enables us also to revise and to amend certain misleading historical judgments. The reputation of Euergetes II., as handed down by Diodorus, Josephus, and Justin, is preposterously and fantastically bad. He is painted as a monster of wickedness, whose enormities are hardly lightened by a taste for literature and a pretty talent for Homeric criticism. He was so hated, Justin tells us, that he was forced by an uprising to flee the country to Cyprus, and the sovereignty was conferred by the Alexandrians upon his sister and discarded wife, Cleopatra II. To spite her he murders their son Memphites and sends her the mutilated remains in a box. Memphites was born a year after their marriage, which Euergetes had celebrated by murdering in public, before the eyes of his bride, her own son, Philopator II. But these peccadilloes were all forgiven and forgotten; for later we find in the royal decrees this same Cleopatra "the sister" associated with the name of Euergetes and Cleopatra "the wife." If we accept this nightmare as history, it is not easy to guess upon what meat these Ptolemies and Cleopatras fed; yet some historical scholars have accepted

such tales without demur. Professor Mahaffy, writing eight or nine years ago, shrewdly surmised that we must take this farrago with many grains of salt, and observed that this Egyptian Nero reigned over a country which was well administered; he cited, for example, the curious suit of Hermias vs. the Choachytæ in Peyron's collection, where the evidence goes back more than eighty years, and the verdict is rendered on principles which would have been accepted in an English court of law. Such favorable opinions are most strikingly confirmed by the contents of this present volume.

It happens to contain in great fulness the records kept by a certain Menches, a Government scribe of the village of Kerkeosiris, from 120 to 111 B. C. These present royal decrees of great importance, official correspondence, and a complete survey of the village land according to its taxable classes and subdivisions. The result is a miniature exhibition of the minute and elaborate methods of Ptolemaic administration; the result is also a vindication, in a general way, of the substantial justice of the policy of Euergetes II. The revolt which Justin swelled to a revolution, driving the King into exile, dwindles here to an ἀμειξία, or disturbance, which was quelled within a year in the Fayûm, and which probably never even alienated Alexandria. The son of Philometor, who was picturesquely assassinated at the wedding feast, according to the latest evidences died, in all probability, before his father and before the accession of Euergetes. But indeed the whole series of decrees which are contained in Papyrus No. 5, dated 118 B. C., and issued in the name of Euergetes and the two Cleopatras, the "sister" and the "wife," are chiefly remarkable for the enlightened equity of their provisions to secure the person and property of the tax-payer. The heaviest penalties are directed against officials who attempt to defraud or oppress the tax-payer, by using false measures or imposing compulsory labor, by imprisoning or enslaving debtors, or confiscating the tools and implements of their labor. That the officials were often corrupt and had strong temptations to prey upon their subordinates, leaks out in several of the documents. Menches is obliged himself to pay a fixed annual rate, apparently a douceur, for the privilege of retaining his office; and his palm in turn is greased regularly by a certain Dorion, to whom a receipt is given for mysterious and unmentioned services. This Orientalism of method (which is, after all, Occidental enough to be understood from New York to San Francisco) doubtless vitiated more or less the best-laid administrative schemes; and certainly the general spirit of the regulations for suits between Greeks and Egyptians is fair and statesmanlike. One of these expressly requires Greeks who have made contracts written in Egyptian to refer disputes to native tribunals, and forbids the chrematistæ to drag suits between natives into their own Greek courts. The revenues of the Egyptian priests and shrines are also protected, and the general aim of this legislation is clearly the equalization of the nationalities before the law and the minimizing of Greek overreaching and encroachments. This, indeed, may account for the bias and misrepresentations of the Greek historians.

The collection of the royal revenues involved a system of minute supervision, a great multiplication of officials, and a pervasive bureaucracy. Some vivid glimpses of the operation of this machinery are shown in a letter from a tax-farmer (B.C., 111). He wishes to retain his privilege, but is outbid by a rival; he has obtained a view of his competitor's offer by bribing the notary. "To avoid a storm at the audit," he proposes to abstract this memorandum and make away with it, by the aid of a further bribe. All this has a very modern sound; and the counterpart may be found in a long message of the same date from the King's "cousin," the diœcetes, to a delinquent named Hermias. He is sharply reminded that he has already failed to give satisfaction, and has employed corrupt and worthless subordinates; he is warned for the last time to mend his ways, and to send a list of persons "from the army and from his neighborhood, of conspicuous honesty and steadiness," who are to take charge of the inspection of crops and the collection of taxes.

It is quite impossible to give any summary of the lengthy documents which make up the chief wealth of this volume and furnish a tolerably complete view of the accounts and records of a bureau of taxation about B. C. 118. They include a land survey of the village of Kerkeosiris, lists of the owners and cultivators, the quality and classification of the land, the kinds of crops, the rents and the nature of tenure. The documents raise some new problems as to the meaning of technical terms, and solve satisfactorily some old ones. We must admire the dexterity and science with which Mr. Smyly follows the calculations of the scribe, detects and accounts for his inaccuracies, and extracts luminous general results. From the mass of intricate details a few salient and significant facts emerge. Out of the whole area within the village boundaries—about 2,400 acres—more than half is crown land, yielding a rental, in many cases, of more than ten bushels of wheat per acre. Nearly one-third is cleruchic, that is to say, assigned in nearly equal portions to Greek and to native soldiery. This equal apportionment points once more to the policy of Euergetes II. of conciliating the Egyptian populace and enlarging their privileges. The proportion of "sacred land" is more than three times the extent of the small area covered by the village proper; but it is a significant fact that this single petty village contained no less than fifteen shrines, or temples, of Egyptian and other divinities. There was apparently no private land whatever in this district. The ordinary method of calculating the area of lots, as Mr. Smyly points out, was such as regularly to overestimate the contents and to give a slight advantage to the Government.

The greatest surprise, perhaps, which has been extracted from these relics is the discovery that the numismatists have been completely astray with regard to the ratio of silver and copper in the late Ptolemaic period. Copper money was used very extensively, and the generally accepted theory has been that the normal ratio between a silver and a copper drachma was 120 to 1. This opinion was held by Mr. R. S. Poole, and has been maintained by Brugsch and by Révillout. The view of the latter scholars was based on the interpretation of Demotic formulæ, guided by a preconception in favor of the ordinarily accepted ratio of 120:1. Their conclusions were traversed by Grenfell in his discussion of the Revenue laws; and his doubts find complete confirmation in the evidence of the Tebtunis collection. Here we have a number of different documents and accounts which exhibit examples of conversion of silver into copper drachmæ; in more than a score of instances the ratio of silver to copper is distinctly stated, and these ratios range from 1:375 to 1:500. Curiously enough, in the same set of accounts the range is from 450 to 500. The documents cover the latter part of the second century and the beginning of the first century B. C. The evidence of the Demotic formulæ was obscure and dubious; as to the evidence of the Greek there is not a shadow of doubt. The editors, therefore, draw certain inferences which seem to be warranted by the facts and by common sense. They conclude that the copper drachma never weighed the same as the silver drachma; that the copper drachma was in fact an ideal or imaginary unit, too small for coinage and circulation—a situation which finds a parallel in the copper coinage of the Byzantine Emperors. The smallest coin in circulation may have been a five-drachma piece. They conclude, further, that the copper coins in actual use, such as the 80 and 40-drachma piece of Cleopatra VII., did bear a definite and fairly constant ratio in weight to the weight of the silver coins; and this ratio hovers in the neighborhood of 30 to 1.

Another extremely interesting and valuable discovery is the papyrus containing a marriage contract practically complete, dated 92 B. C. The only Ptolemaic example hitherto known belonged to the second century B. C., and contained lacunæ which the present document satisfactorily supplies. In this contract, the husband acknowledges the receipt of a dowry from the bride's mother, and binds himself to remain faithful to his wife, to marry no other while she lives, to keep no separate establishment, to maintain her as well as his means permit, and to abstain from ill-treating her or from alienating her property. If he violates any of these engagements, he is to repay the dowry forthwith on demand. The wife, Apollonia, on her part, is to obey her husband, to remain at home except by his permission, to be faithful and "not to dishonor their common household." If of her own will she decides to separate from her husband, he must repay the dowry within ten days from the date of a demand for its restoration. This curious equality of rights and these stringent stipulations for marital fidelity are not found in marriage contracts from the Fayûm for the Roman period, though they are faintly echoed in the Oxyrhynchus papyri.

The few literary fragments transmitted to us by these crocodiles are not important, but are certainly interesting. One dithyrambic picture of a woodland scene haunted by swarms of bees and by singing birds whose voices echo from dells and mountains, belongs to a somewhat novel *genre* of lyric verse, and savors of Alexandrian taste and decadence. It may be a picture drawn from a genuine love of nature; but it is expressed in a highly artificial diction, overloaded with epithets and compound ad-

jectives. The besetting sin of the dithyramb is here carried out to frigidity. In the matter of palæography the Tebtunis collection does not offer the remarkable range of the Amherst documents, with their sweep of a thousand years, from the third century B. C. to the seventh A. D.; but they compensate for this by supplying many contracts or accounts from 100 to 50 B. C., a period that has hitherto been sparsely represented.

This most useful volume, which illustrates anew the vitality of Greek studies, appears as the first of the University of California Publications in Græco-Roman Archæology. The funds for excavation and publication were furnished by Mrs. Hearst. The University is to be congratulated on its good fortune, and on the privilege of offering to the public the rich fruits of researches which will throw a new and permanent light on many phases of Ptolemaic history and antiquities.

SIR GEORGE GROVE.

The Life and Letters of Sir George Grove. By Charles L. Graves. Macmillan Co.

Simultaneously with this biography of Sir George Grove appears the announcement that his *opus magnum*, the 'Dictionary of Music and Musicians,' is to be revised and brought up to date by Mr. Fuller Maitland. Grove once wrote to Sir Hubert Parry: "If, with my patience and love of my subject, I were only a musician! That's rather a confession, but I don't mind making it to you." He was no pianoforte player, but relied on his friend Franklin Taylor; while in other branches he had constant recourse to Manns, Dannreuther, Barry, Wood, and other professionals. When, upon the death of Dr. Hueffer, a friend of his (who was not a musician) wanted to apply for the position of musical critic of the *Times*, Grove urged him not to do so, adding: "I know that nothing could induce *me* to take such a post. If I had a new symphony or quartette to report upon I should be all abroad, and then should have to refer to others more qualified in that respect, though perhaps beneath me in taste and literary ability." Dr. Walford Davies wrote that "Sir George taught one to think of him as preëminently an *amateur*"; and, regarding his analysis of Beethoven's nine symphonies, Grove wrote in his notebook: "N. B. Mention in my Beethoven strongly in the Preface that it is not a book for musicians."

Notwithstanding these facts, and the bias which led Grove, for example, to give such a disproportionate amount of space to Handel, Beethoven, and Mendelssohn, as compared with Bach, Chopin, and Liszt, it may be said that the Macmillans could not easily have selected a man better qualified than he was for the making of a musical dictionary. For six years previous to undertaking this task he had been editor of *Macmillan's Magazine*, and he had had further experience in writing and planning and dealing with contributors during the seven years that he was one of the principal collaborators on Dr. Smith's 'Dictionary of the Bible.' He had achieved a reputation for extraordinary conscientiousness and capacity for labor and research, as well as a disposition to get facts at first hand wherever possible. He knew, too, who were the best writers on special musical subjects and composers, and usually secured their services. Thus it came to pass that the 'Dictionary of Music and Musicians,' though abounding in errors of commission and omission, is, nevertheless, even in its present condition, more valuable than the similar works published in other countries, Germany not excepted. Grove's own contributions, including Beethoven, Mendelssohn, and Schubert, are masterpieces, and it is to be forever regretted that he never found time in his busy life to carry out his plan of expanding these into separate biographies. This is true especially of his Schubert. That composer was the special idol of a habitual hero worshipper—his "existence," as he used to say; and Grove not only did a great deal to make him better known and more widely loved in England, but even helped to exhume, in Vienna, some of the buried treasures of that incomparable genius.

Because of his insufficient technical equipment, some of the professional musicians of England were inclined to sneer at Grove in his capacity of editor and commentator. Hans Richter more justly declared his conviction that the services rendered by him in his picturesque and genial analyses of the symphonies of the great masters were of incalculable value in educating the public. The very absence of technical details was one of the great merits of the programme notes, always signed with a simple G, which he provided for two generations of concert-goers. He had been one of those most interested and active in establishing the concerts at the Crystal Palace, which was opened in 1854; and for upwards of forty seasons he contributed his notes on the music to be performed. "I wrote about the symphonies and concertos," he explained, "because I wished to try to make them clear to myself, and to discover the secret of the things that charmed me so; and then from that sprang a wish to make other amateurs see it in the same way." As Mr. Graves remarks: "There have been better analysts, anatomists, and dissectors of the organism and structure of the classical masterpieces; there has never been so suggestive and stimulating a commentator upon their beauties."

Grove was an indefatigable letter-writer. He used to rise at six, or even earlier, make himself a cup of tea (like Gladstone, he drank tea at all hours with impunity), and write non-obligatory letters for a couple of hours before breakfast. Many of these letters are charming. He summed up his travel experiences picturesquely and tersely. Norway impressed him as it has impressed others: "The country is more like Scotland than Switzerland, though all on a larger scale. It has not got the Eternal Snow, nor the frequent contrasts of Switzerland, nor the indefinable charm which will always make Switzerland the dearest country to me. The people are Scotch, with more mildness and innocence, and less *pawky* than the Scotch. . . . Norway doesn't do after Switzerland." Vienna aroused his enthusiasm: "This is a wonderful place, far finer and more interesting and beautiful than Paris. I like it much better." To be sure, here had been the dwelling-place of his beloved Beethoven and Schubert, and here still lived his friend Brahms. Of all the letters in this volume, the most interesting is that addressed to Miss Olga von Glehn (pp. 143-46), in which he describes his adventures (with Arthur Sullivan) in quest of buried Schubert treasures, which resulted, among other things, in the discovery, in a dust-covered box, of the part books of the whole of the "Rosamunde" music, tied up after the second performance in 1823, and probably never disturbed till the visit of the Englishmen in 1867. Much time was also spent on subsequent visits to Vienna in searching for traces of the lost "Gastein" (or real ninth) symphony of Schubert. Grove was so convinced that such a work had been written that he always, on the Crystal Palace programmes, billed the work now known as the ninth as the tenth. Once, when he met a man in Vienna who had actually known Schubert, he was simply frantic with delight. "Of course, this sets all our fireworks off; we go up into the air at once, and burst and explode with enormous reports."

It is from the point of view of the contagiousness of enthusiasm that Grove's services to the cause of music must be chiefly regarded. He did a vast deal to stimulate an English interest in good music—chiefly, however, in the music of the past. In contemporary productions he took little interest. Yet he made allowance for the adage that times change and we change with them. He had heard Costa exclaim: "Beethoven has no melody." He himself had had to confess, on hearing the ninth symphony for the first time, that he "could make very little of it." He remembered Mr. Bicknell's protest against putting the "vile overture" to Wagner's "Tannhäuser" on the Crystal Palace programmes, and the admission of the same man, a year later, that he liked that piece about as well as anything else. Towards Wagner, Grove's feelings were mixed and vacillating. He had the wisdom to choose the best man he could have found (Mr. Dannreuther) for the article on Wagner in his Dictionary. He found the London Wagner concerts, in the composer's presence, in 1877, "delightful"; and years later he bought Bayreuth tickets for a student at the Royal College of Music (of which he was the Director from 1882 to 1893). "Tristan" did not appeal to him musically, and morally he objected to it violently, being, like so many others, under the ludicrous delusion that "the story is one of wicked passion." "Die Meistersinger" he liked. "Parsifal" disappointed him at the first hearing; "but this," he wrote to Dr. Wood, "I have not said to any one but you, and don't wish it repeated, because I should probably have said much the same after first hearing the Ninth Symphony."

Grove met Liszt in Rome, and the great pianist played for him by request, which he seldom did. No opinion of Liszt's music is expressed, but Grove refers to his playing as "so calm, clear, correct, refined—so entirely unlike the style of the so-called 'Liszt School.'" Tchaikovsky, he opined, "goes in far too much for emotion," and Richard Strauss's "Zarathustra" seemed to him an "absurd farrago." Schumann (who died in 1856) was really the last of the great masters (unless we count Brahms as one) who elicited his full sympathies; and Schumann needed his services a generation ago. The leading critics "were decidedly hostile to him, and it took all the missionary enthusiasm of Manns and Grove and a few

others to make headway against the coalition of Philistines and prejudiced experts," who looked upon him as "a dreary and most unmelodious mystic." Mr. Chorley of the *Athenæum*, we are informed, made it a point to the end of his life to walk out of the concert room at the beginning of the second movement of Schumann's quintet, to mark his high disapproval of a certain chord in the eighth bar!

Mr. Graves's book partakes, as he is himself aware, somewhat of the nature of patchwork, and it is not free from errors, among which a reference to John Quincy Adams (meaning Charles Francis Adams) as former Minister to St. James's is conspicuous. But there is much interesting reading matter, and the author has adopted the autobiographic method as far as possible, letting Grove speak for himself in letters and otherwise. Nor is it only to music lovers that the volume appeals. Grove was a man of remarkable versatility, well informed in regard to such diverse subjects as engineering, Biblical antiquities, geography, ancient and modern (a primer of geography in the Macmillan series is among his works), Chinese porcelain (on which he intended to write a book), and so on. He was also a great reader of books and very fond of poetry, his favorites being Matthew Arnold, Clough, Tennyson, and Wordsworth. Tennyson, a friend of his informs us, "was far more to him than Shakspere." He was on terms of intimacy with him and exchanged letters, as he did with Browning. He was almost as fond of parallels as Plutarch, and in one of his letters he likens Beethoven to Tennyson "in his fondness for friends and dislike of strangers, and his constant mention of the 'honorar' for his pieces." On one of his visits to the poet, he asked him to explain the difference between a cowslip and an oxlip in the lines

> "As cowslip unto oxlip is,
> So seems she to the boy."

Tennyson answered this by picking up one of each in the copse behind the house, and showing his visitor how the one stood erect and the other drooped its head.

Shelley also interested Grove greatly, and at one time he intended to write a life of him; but Dean Milman, who had known Shelley both at Eton and at Oxford, wrote to him, "in the strictest confidence," and effectually dissuaded him from undertaking a task which, in Milman's opinion, "might never be carried out." We also catch glimpses of George Eliot, whom Grove berates in an article for her "false air of learning" in musical and other matters, and of G. H. Lewes, of whom he gives a ludicrous account at a rehearsal of the first Brahms symphony, "ostentatiously beating time all wrong." Grove had a strong sense of humor. His notebooks were filled with a curious jumble of jottings for his articles, ghost stories, and jokes, three of which are worth citing. An old soldier, reduced to beggary, carried a placard with the inscription: "Actions, 7; wounds, 9; children, 8; total, 24." A self-sacrificing cat once remained on the platform of St. James's Hall all the time Sarasate was playing the Mendelssohn violin concerto, "so as to oblige him with a string in case he broke one." At a concert in St. Louis, Hans von Bülow was preceded by a soprano who screamed dreadfully. When the witty pianist subsequently sat down at the piano, he preluded his piece with the recitative from Beethoven's Choral Symphony, "O Friends, Not These Tones."

The Influence of Emerson. By Edwin D. Mead. Boston: American Unitarian Association. 1903.

Mr. Mead's book is probably a better one for not having been written with immediate reference to the Emerson centennial. Its several parts have grown like the temples of Emerson's "Problem," "as grows the grass"; they have been tested, as Emerson's essays were tested, by public delivery in many places. They are sincere expressions of a hearty and intelligent admiration for Emerson, viewed first in his philosophical aspect, and afterward in connection and comparison with Theodore Parker and Carlyle. The three chapters were written at different times from different inspirations. The title under which they are brought together is not particularly appropriate, and is rather a disappointing one. Except in a manner strictly personal to Mr. Mead, it does not describe the book, which bears on every page the mark of Emerson's influence on him, and we know that here there was nothing singular—that Mr. Mead was one of many to whom Emerson brought liberation and encouragement and peace. In this indexical fashion Mr. Mead's title has, perhaps, sufficient justification, but we fear that it was chosen in despair of finding one actually descriptive of the book's disparate contents, through which the personality of Emerson runs like a golden thread.

Those who deny to Emerson a genius or talent for philosophy have a difference to settle with Mr. Mead, who maintains a contrary opinion in his first chapter, "The Philosophy of Emerson." He contends, and reasonably, that Emerson's indifference to metaphysics was less absolute than Emerson himself imagined it to be. He finds the best expression of Emerson's philosophy in the 'Nature' of 1836, making less use than he might have done of his 'Natural History of Intellect,' where the idealism of Emerson is more distinctly qualified than in the earlier writing. Mr. Mead's method is to test the philosophy of Emerson by its application to the distinctive tendencies and problems of his time, and especially to the doctrine of Evolution. He does not exaggerate the evolutionary strain in Emerson's thought, but he does exaggerate his anticipation of Darwin when he says that "Darwin's truth lies in Emerson's philosophy as a natural and essential moment of it," for "Darwin's truth" was "the origin of species by means of natural selection" and not merely evolution, of which there was plenty in the air before he came. Mr. Mead resents John Morley's dictum, "It is a misconception to pretend that Emerson was a precursor of the Darwinian theory," but he makes no quotations that break the force of Mr. Morley's declaration, nor do we believe that any can be made. A considerable part of the first chapter is devoted to the exoneration of Emerson from the charge of ethical fatalism; and though some hard sayings block Mr. Mead's way, he comes safely to his goal. Even Emerson's essay on "Fate" is, in its final outcome, an affirmation that man is fated to be free.

Mr. Mead's second chapter, "Emerson and Theodore Parker," is written with a fine glow of enthusiasm for both subjects of his discrimination, but especially for Parker. This is a welcome aspect, because it has become a habit with many persons to comfort themselves for their obligation to admire Emerson by depreciation of Parker. Moreover, it is obvious that Parker is more inexpugnable than Emerson to the reaction that is upon us: he cannot be construed by the most ingenious in terms that write down the anti-slavery conflict as a great mistake, and slavery (in Mr. Woodrow Wilson's phrase) as "not so bad as it was painted." Mr. Mead brings out with striking force and in a dramatic manner the mutual relations of Emerson and Parker, quoting their words of generous mutual appreciation. Exception will no doubt be taken in certain quarters to the judgment that "there was no so conspicuous case of persecution in the century as that of Theodore Parker"; some contending that his path was "roses, roses all the way," and some that it was he who persecuted the defenders of the Unitarian faith. We cannot ourselves agree with Mr. Mead that Parker "was a man who had no delight in controversy." It is certainly indicative of a remarkable change in Unitarian opinion that this generous eulogy of Parker, this frank dissent from his conservative critics and opponents, should be published by the American Unitarian Association. It is an interesting judgment that Emerson and Parker have helped us more than any others to see the transcendent preëminence of Jesus and the Bible among books and men, "because recognizing this preëminence on the ground of freedom and pure reason."

The "Emerson and Carlyle" chapter is the most elaborate in the book, taking up nearly half of its three hundred pages. It is a piece of admirable discrimination. The agreement and difference of the two men, their likeness and unlikeness, are set forth in a vivid manner. So are the details of their meetings and partings, and their mutual services, whether in the way of commendation or reproof. There was more friction than Mr. Mead imagines in their intercourse and less absolute continuity. At one time, when Carlyle's temper was particularly bad, Emerson said to the writer of this article, "I have let silence answer him so far, and shall until he has a better mind." The relations of the two men to Goethe are drawn out in an interesting manner. Emerson is credited with less discipleship than Carlyle, but certainly Emerson took over more from Goethe than the perfervid Scot, or was naturally more akin to him. To either, Goethe's moral looseness must have been a gross offence. We are told of Emerson's reading of Goethe's 'Farbenlehre,' and are not told that he ever extricated himself from the snare of its attractive speciousness. If there is a defect in Mr. Mead's criticism it is that his royal Emerson can do no wrong. In every awkwardness of his verse he finds "a wondrous strength and a wondrous fitness," and says we shrink from making any change. But surely some of us have imagined that in a good many places we could easily improve the form without any loss of meaning whatsoever.

Principles of Home Decoration. With Practical Examples. By Candace Wheeler.

Doubleday, Page & Co. 1903. Pp. x., 227.

In this little book there are full-page illustrations, fifteen in all, some of which represent scenes in American houses and some give only details of decoration or pieces of furniture. They are not numerous enough to form a very important part of the book. They hardly exemplify the text, and serve rather to adorn the volume than to aid in the exposition of "principles."

The text is divided into thirteen chapters, the character of which can be judged by the sub-titles. Thus, Chapter IV. is devoted to color in houses—as a science—as an influence—and occupies seven pages, while Chapter VII. takes up color again and deals with it in reference to light and with regard to its gradation. In like manner, walls, ceilings, and floors are treated all together in Chapter VIII., and then, separately, in Chapters X., XI., and XII. In all these chapters it is noticeable that very great attention is given to the question of color treatment of walls and ceilings; in short, of the rooms themselves regarded as units. There can be no question that the right note is struck when the relative importance of color is insisted on here. Color is indeed the one serious question in the beautifying of our house interiors. It is rare that anything serious can be done with form. The walls must be flat and the ceilings smoothly plastered; anything massive in the way of boldly treated woodwork, and still more anything decided in the way of facings of stone or marble, is out of the question in nearly every instance. The mantelpiece alone is thought fit to receive a more decided treatment, and well do we all know the unfortunate effect of the projecting, massive-looking, dark-colored, showy mantelpiece in a room which is otherwise so flat and smooth, so thin and light in its apparent structure. The essence of decoration must be in the pleasant combinations of well-toned colors, lighted up occasionally with stronger passages of those hues which approach the primary colors in brilliancy. And it is to be observed that in the filling of the room with portable objects, whether in the way of necessary furniture, with its coverings of textile fabrics or leather, or in the way of works of art, hung upon walls or set upon shelves, colors may be so combined as to harmonize perfectly with the hues given to wall and ceiling. In this chief merit, then, the book is to be praised without reserve. Throughout the whole treatise, for it may be called so, there is constant insistence upon the need—the primary need—of the utmost care in the treatment of the brown and green, yellow and white, or the harmony of rosy grays. In like manner the surface is discussed with a view to its color effect upon the whole room; and the question of tapestry, wallpaper, oil painting, and the other ways of disguising a wall surface is constantly kept in mind.

The opening sentence of Chapter I. states that probably no art has so few masters as that of decoration; and a further statement shows that by a "master" is meant some one of authority, "a leader whose very name establishes law." The author seems to think that William Morris was for many years such a leader in England; but it is, of course, an error to suppose that the strong mediæval proclivities of Morris and the resulting character of picturesque fancy imparted to his designs and those of his followers were ever of general acceptance in Great Britain. It is apt to be forgotten that the loud, the reiterated, the unmeasured praise given to Morris as a designer, and to the qualities of his decorative school, is the utterance of his special admirers—of those Englishmen who retain so much of the feeling of the middle century, 1840 to 1870, that they are properly to be described as advocates rather than critics. Unquestionably that quasi-mediæval feeling is much stronger in England than anywhere else in the world; but it would be a mistake to assume that it is prevalent among the masters of design of our own time. All of which is only another way of saying that there is no such thing as a leader whose lead will be acknowledged by the majority of designers. A style prevails, but the influence of a critic or of an artist whose works serve as exemplary, has not prevailed very generally at any time or in any community since the people of the United States began to talk about the fine and decorative arts.

The book before us does not err in preaching the doctrine of authority; it is, on the other hand, of a good general tone, suggestive rather than positive, and therefore more truly critical. The claim for supreme excellence in domestic decoration for the United States is made. It is preposterous, of course, but in the present mood of the American people a book will harly be read unless it begins with this wretched flattery of our own place and time; and, moreover, the childish optimism of the day influences the intelligence of even the most sagacious writers, and they find themselves utterly unable to "see things as they are." It is true, however, that there is a general feeling for gentle harmonies of color among the Americans who have concerned themselves with house decoration during the last quarter century. No one among us can combine brilliant colors or produce strong chromatic effects of any sort. No one among us can design patterns —firmly drawn scrolls and well composed flower work, leaf work, or animal form, whether more or less conventional. No one among us dares trust himself among decided contrasts and strong lights and shades. But in the quasi-Japanese taste of the most delicate combinations—of buff with white, of warmer and cooler gray, of gold with cream color, and the like—very good things have been done, and Mrs. Wheeler has every right to praise her own age and her own people thus far. So small a book as this may be forgiven if it does not go much farther afield or grapple with the whole vast subject. There are, after all, not more than forty thousand words in the book before us.

In the Andamans and Nicobars: The Narrative of a Cruise in the Schooner Terrapin, with Notices of the Islands, their Fauna, Ethnology, etc. By C. Boden Kloss. With maps and illustrations. E. P. Dutton & Co. 1903. 8vo, pp. xvi, 373.

"A cloudless sky and a blazing sun; a long stretch of yellow beach lapped by a calm sea of brilliant green above the reef, verging into an intense sapphire in the distance. Inland, swelling hills clothed in densest jungle—the topmost ridge capped by a delicate tracery of foliage that stands out clear-cut in the pure atmosphere." The main object of the cruise described in this volume, amid scenes of which this picture is characteristic, was to secure specimens of the fauna of the two archipelagoes lying off the coast of Burmah. Though the collectors were but two in number, Dr. W. L. Abbott and the author, they succeeded in obtaining sixteen new varieties of small mammals and ten hitherto undescribed species of birds. These, together with many ethnological objects, are now in the National Museum at Washington. The largest part of these collections were made upon the southernmost group, the Nicobars, which have been rarely visited by Europeans and are still to a great extent unexplored. The first half of the volume is a simple narrative of each day's work during the three months' cruise. It is singularly free from exciting incidents or adventures. Unlike most tropic lands, the Nicobars, at least, have neither beasts of prey, noxious reptiles, nor hostile savages. A small tribe—the Shom Pen—living in the interior of the southern island, is reputed to be persistently hostile to the other natives. But, with the exception of a few families who held friendly intercourse with the coast villages, none of these were encountered. The second half is devoted to a general description of the islands, their fauna and flora, their inhabitants, and a sketch of their recent history. Much of this is naturally taken from the writings of others, but much is the record of the explorers' own observations. The various species of birds and animals are so small as to be of little interest save to the collector; with exception of the megapode, a bird about the size of a partridge, which constructs a peculiar "nest-mound." One of these mounds "was between 7 and 8 feet high, and rather more than 100 feet in circumference, and had a large coco palm growing through the centre. It would certainly be the work of a number of birds, and must have taken many years to build."

The native as described in these pages is singularly uninteresting and characterless. We are inclined, however, to ascribe this to the fact that the travellers never came to know him familiarly. If, instead of spending their nights on the schooner, they had stayed in the native houses, the Nicobarese might have become as individual and attractive as Dr. W. H. Furness found the head-hunters of Borneo after he had lived among them and won their confidence. They are by no means pure savages. Their huts, with conical roofs thatched with palm leaves, the apex crowned by a high finial, are most pleasing in appearance. "In the charms and talismans connected with their superstitious cult they betray a certain artistic ability, and their pictures, screens, and figures of birds, men, and animals, show not only good powers of observation, but a capacity and skill of no mean order, in interpreting and reproducing whatever may present itself to them." They are expert basket makers, and on one island the women enjoy a monopoly of a pottery industry.

In social customs, religious rites, and morality the inhabitants of the various islands differ. Of the Andamanese it is stated that, "once married, conjugal fidelity until death is the rule, and bigamy, polygamy, and divorce are unknown." Although this

is apparently not true of the other islanders, yet among the Nicobarese

"the position of women is, and always has been, in no way inferior to that of the other sex. They take their full share in the formation of public opinion, discuss publicly with the men matters of general interest to the village, and their opinions receive due attention before a decision is arrived at. In fact, they are consulted on every matter, and the henpecked husband is of no extraordinary rarity in the Nicobars. In Kar Nicobar, where the villages are divided into groups of several houses, a woman occasionally succeeds her late husband as sub-chief, on account of the knowledge she may possess of the regulations in vogue, the property and customs of her neighbors."

The matriarchal system prevails with them; that is, when a man marries "he becomes a member of his wife's family, leaving the house of his own parents, or even his village, if the woman dwell elsewhere." Honest, truthful, and industrious, they deserve a better fate than the increasing intercourse with other peoples is bringing upon them—deterioration and ultimate extinction, unless rescued by the missionary and the teacher. An illustration of one of the worst of the evils of this contact with the civilized world is furnished, unconsciously it would seem, by Mr. Boden Kloss. Several times liquor was given to their visitors, notwithstanding its strict prohibition by the British authorities, and its effects are described in a would-be humorous manner. After a carousal at a village over rum which they had provided, and of which all—men, women, and children—apparently, partook, the headman "received the finishing touch from the rum, and, before we left, embraced Abbott with fervent gratitude: 'You good man, I love you; you make us all nice and drunk. Oh, I feel so nice!'" (p. 88). In the light of this incident it is not surprising to learn that a catechist on a neighboring island, after five years' work, had "not succeeded in converting any of his adult neighbors to Christianity."

An interesting account is given of Port Blair, the English convict settlement on one of the Andamans, and of the methods employed to educate and elevate the 12,000 prisoners. A reasonable degree of success is reached, as is shown by the fact that the savings bank, "the largest local bank of the kind in India," has now over 2,300 open convict accounts, and that scores of reformed men are sent back to India every year. Dampier's entertaining narrative of his adventures on Great Nicobar in 1688 is given in full, and there is a detailed description of some of the customs of the islanders, including feasts, dances, burial rites, and wizardry. The most important contributions to science are to be found in the chapter on the fauna of the islands, and in the appendices, devoted to measurements of some of the natives, the principal flora, census tables, and trade articles and presents most in demand. Of these last, none have such value as plated spoons, forks, and soup-ladles, "in which the natives invest nearly all they obtain by the sale of their coconuts." They are suspended on a framework in the centre of the floor of their dwellings, "covered with alternate strips of red and white cotton, so that it seemed to be made of barber's poles." They are all destroyed at the death of their owner. More than a hundred reproductions of admirable photographs, mostly of the natives and their homes, lend not only an attractiveness, but an especial value to this work.

The Woman's Library. Volume I.—Education and Professions. Volume II.—Needlework. Edited by E. M. M. McKenna. E. P. Dutton & Co.

"The Woman's Library" is not a promising title for a series. A library is the last thing that should mark distinctions of sex. Indeed, it must always surprise the observer that the very women who are for identifying their interests with the interests of men should propagate "woman's buildings" and hammer on the phrase "woman's work." This century has almost reached the point of envisaging women as human beings, qualified or disqualified, like men, by their training or intelligence for the various branches of the world's work. It is the fault of the women if they persist in playing the amateur. Fortunately, this air of a successful experiment is more and more confined to the written records of the feminine advance. The woman who works is less apt to remind you how completely she has outclassed her grandmother. The woman who really advances her cause is she who, without advertising her feminine intuition, offers herself for special work on the non-sexual grounds of training and expert knowledge. Meanwhile, until she is in the majority, we have the "Woman's Library."

The first volume is decidedly mixed in its aims. At one moment you would take it for a practical guide to women about to enter certain professions; the next, you are landed in a purely æsthetic essay on "The Artistic Faculty." The first article, a review of the "Higher Education" by J. E. Hogarth, covers ground so well trodden that not a single new blade of fact can be made to grow in it. So it seems to the American mind. But these articles are written by and for Englishwomen, of whom very few go to college; moreover, it may not be time wasted to remind any English reader that education is not merely part of the routine of life, chiefly recorded in one's checkbook, but, like sport and commerce, actually has its problems. If Socrates could buttonhole the British parent in Piccadilly and demand his definition of a public school and why he sent his son to Eton, what fresh fields would flatter his sententious energies! He would have no such easy time with an American father, forearmed with several complete sets of theories and counter-queries.

Miss Hogarth's description of the sex-isolation and "perpetual girlhood" of the college-trained woman who in England becomes a schoolteacher, should suffice to warn off the boldest. It appears that even a college course does not quite obliterate the inherited English prejudice against "bluestockings." For here is Miss Hogarth suggesting that the college plays the part of the Catholic convent in relieving the domestic circle of its misfits. The convent was a more drastic remedy, but even four years of relief are better than nothing—"by the end of which time you will very likely find that they have solved the problem themselves, either by finding friends (possibly even a husband) more to their liking, or by deciding to enter a profession" (p. 41). A charming argument *ad parentes*, but not, we think, quite the right line for the promoters of a "Woman's Library." The article is well written, and in that respect contrasts with most of the others.

In her essay on the "Education of the Artistic Faculty," Mrs. Jopling devotes a mind not narrowed by education in the ordinary sense to the discussion of the origin of art, the advisability of learning to draw, and kindred topics. Beyond giving the Royal Academy regulations—which, by the way, still exclude women from the study of the nude—she gives very little practical information, but prefers to moralize to the tune of 170 pages, advising women to "drink deeply of the Perian [*sic*] well," to remember that "Orare est Ororare [*sic*]," "a motto which every artist ought to know by heart"; to send Christmas cards to hospitals. The artist should, above all, know how to boil an egg, while Longfellow's "Psalm of Life" may be taken as a safe guide for conduct. "Great, indeed, is Truth, and her power continues for ever," cries Mrs. Jopling. Her paper ends with a misquotation of Milton.

Mrs. Kendal's essay on "Theatrical Life" is short and much to the point. Its only aim is to deter the ambitious, and it begins and ends with advice to the amateur not to abandon her advantages for the uncertainties, or rather certain disadvantages, of the professional life. Mrs. Kendal, at any rate, sticks to her last; her statement that in London alone there are three thousand actresses always out of work half the year at least—the inevitable result of overcrowding—should for the aspiring amateur be worth a good many papers on "Art and the Mission of the Stage." "Not," says Mrs. Kendal of amateurs, "that I deceive myself for one moment with thinking I shall restrain *one*."

The woman who thinks that "Journalism" (whatever she may mean by that) is her true vocation, will find herself quite as urgently dissuaded by Miss Billington's essay, in its way as strong a deterrent as Mr. Henry James's recent story, 'The Papers.' The short practical papers on "Sanitary and Factory Inspection for Women" are really the most useful in the volume, since from them a woman may gather the necessary information as to training and the sort of work she will have to do. It is interesting to note that in Ireland women have an equal vote with men on all issues except the Parliamentary franchise. Their privileges in England and Scotland are much more restricted. In Edinburgh, however, a woman is at present chairman of the School Board. The difficulty about the public work of women is that they will not or cannot organize—a defect that is bound to handicap them in nearly all their enterprises.

The second volume of the series (to be followed by four others) deals with embroidery, dressmaking, millinery, and knitting. Few people know that there are in England thirteen regular schools of millinery, having rigidly prescribed courses and examinations; in some cases even residence houses are provided. This is an encouraging sign in a country where the technical education of women is terribly neglected. The paper on "Millinery," by Miss Clare Hill, is meant for the guidance of the hard-working milliner—the girl who pays a three-guinea premium and gives her services in a workroom for two or three years. It

is admirably practical, but will this six-shilling volume ever reach the struggling milliner? The article on dressmaking should be useful to the amateur, at least while the present fashions hold.

These volumes are attractively got up, and rather expensive. There is no preface to indicate their aim, and no method can be detected in their appeal to women. They are partly a record, partly a hand-book, in the main poorly expressed; for whom they are intended is not always clear. The chief impression that they leave is of the terrible overcrowding of all the trades and professions that are open to Englishwomen. That is the aspect on which for her own field every writer insists. Do not go into the medical profession unless you have private means; teachers are a drug on the market; actresses in crowds are out of work; scores of applicants besiege every possible opening in journalism. It is a depressing picture, and we hope that a future volume will offer some solution. A really practical set of articles on Emigration is what is wanted. All the energies of Englishwomen who devote themselves to the advancement of their sex should, we are convinced, be directed into this channel. It is an astonishing thing, and not encouraging for their future, that women in England are content to remain a superfluity. It looks as though nothing short of an immense exodus of women of the middle and lower classes would save the situation; and of that we see little prospect.

Biblia Cabalistica, or the Cabalistic Bible. By the Rev. Walter Begley. London: David Nutt. 1903.

The Cabala, whether as a huge mass of written and printed matter or as a parti-colored system aiming to expound Biblical mysteries, has been to the general world something weird, dubious, undefined, and probably beyond bounds of human comprehension or profit. Yet many students, to our own time, have attacked it with hopeful zeal, though some of them must have found the text easier than the commentary. One of this "somewhat eccentric band of bibliophiles," the Rev. Walter Begley, author of a previous 'Biblia Anagrammatica,' now offers enlightenment as to the various numerical cabalas and the ways in which they have been applied to the Scriptures. The subject is even darker than one might suppose, for there are (in the large sense, and to put it mildly) two cabalas instead of one. The old one is "mainly Hebrew, and occasionally Greek," and was in full tide from B. C. 100 to A. D. 300. The other, with which Mr. Begley is chiefly concerned, and which he thinks scarcely one person in a hundred has heard of, is Latin, and exists in two forms of independent origins and different methods of counting; one arose in Germany about 1530 or later, the other in Italy, near Piacenza, in 1621. These have had variations, and all have been used by Christians and applied to both Testaments.

To the hardened cynic all this is what the Gospel was to the Greeks; but Mr. Begley approaches his topic in another temper. Like Jean Valjean, he has two wallets, severally enclosing faith and the scientific spirit. He writes chiefly "for lovers and collectors of literary curiosities," and plumes himself on the fact that his sources are very rare, and mostly "not in the British Museum, or Bodleian, or any English library that I know of." On some points he keeps a mind as open as that of Mr. Balfour concerning protection. Believers in hidden meanings may at times have gone too far, he says; some of their instances are "not very convincing." Thus, of Faulhaber's record (1632) of the apocalyptic numbers found on a fish or on "the horns, hoofs, and back" of a stag, he observes: "These marvels have always been received with marked attention by the uneducated vulgar, which I suppose accounts for their recurrence." Yet in the narrative of the marriage at Cana he finds "a cryptic statement of an esoteric character," conveying some deep inner truth; and among the varying interpretations of Abraham's 318 circumcised servants, as indicating the 318 bishops of Nicæa, or the steward Eliezer (the letters of whose name by gematria add up 318), or Unica Crucis Figura, he prefers as "most likely" that of the Epistle of Barnabas, *i. e.*, 10 and 18 stand for the first Greek letters of the name Jesus, while 300 stands for T, the figure of his cross. Here, apparently, the wallet of faith was drawn upon rather than that of science.

The craving for mysteries, for something outside the merely known and rational, lies deep enough in humanity to have withstood all assaults thus far. It is common to orthodox devotees and Christian Scientists. After denying all the Bible miracles, Abner Kneeland spent all he could raise in a search for pirate gold revealed to a child through a glass of Hudson River water. Other theologians besides Bishop Wordsworth believe in "the symbolical meaning of numbers in Holy Scripture." But what meaning? The labor spent in guessing at that might have carved innumerable vessels and palaces out of cherry-stones, and engraved many Declarations of Independence on discs an inch wide. And why not, if there be time to burn, no pressing duties, and no turn for practicality? As one of the modern cabalists said, he had spent time worse in his days of sin. To this temper it was of course that primitive Christians were initiates, "with mysterious knowledge carefully conveyed and concealed"; that agnosticism was an inevitable appurtenance to Christianity, if not an essential part of it; that Moses on the Mount had received a secret revelation to supplement the published one; and that evangelists and apostles meant something other and more important than what they wrote. If this were so, no labor could be wasted in delving for the hid treasure. And on a lower plane, it was, perhaps, not more unwise to search for latent meanings in the sacred writings than for the allegory in Shakspere's sonnets, or for traces of Baconian authorship in the plays.

The theory was pretty enough, but the practice soon became confusion worse confounded. The Italians used a simple notation, counting the letters of the alphabet as 1 to 22; but the older or ordinary cabala advanced by tens from K to T, and thence by hundreds, valuing U as 200 and Z as 500. On these beginnings innovators might improve at will. Henning's 'Cabbalologia,' 1682, gives examples "in triangular, square, pentagonal, heptagonal, octagonal, enneagonal, and decagonal numbers." Add to this that four languages (and why not more?) were employed, the varying letters and words of Latin and German versions apparently giving as good a clue to the divine intent as those of the originals, and the stalwart hopefulness of these explorers of infinite heights and depths looms out large. Judged by Mr. Begley's samples, the learning of the seventeenth century appears on a par with that of the thirteenth, and as profitably applied as in the pulpit inquiry into the botanic origin of the club wherewith Cain killed Abel. Here is one of the least abstruse, which would detect a prophetic reference in Hebrew times to a worthy and popular Lutheran hymnist who died in 1737: The first and second verses of the Ninety-sixth Psalm (*Singet*, 540, etc.), being valued by letters and words, count up 8,097. Then take this summary of titles: "Herr Benjamin Schmolk, Pastor Primarius und Inspector der Evangelischen Kirchen und Schulen zu Schweidnitz." Tot that up, and it comes out just 8,097! Now this is truly remarkable—if only as a specimen product of

> "The miraculous, infinite mind of man,
> With its countless capabilities."

Altersklassen und Männerbünde: Eine Darstellung der Grundformen der Gesellschaft. Von Heinrich Schurtz. Berlin: Reimer. 1902. ix.+458.

The author of this volume is well known from his other ethnological publications, and ranks as one of the ablest and most suggestive writers of the newer school. The book grew out of a study of the "bachelors' houses" and "men's houses" found in various parts of the globe, particularly in the Indo-Pacific area, and is a valuable addition to the small stock of scientific works dealing with the sexual-social phenomena of primitive humanity. The four sections into which it is divided have to do with the following topics: The primitive constituents of society; age classes; the men's house; clubs and secret societies. The brief linguistic appendix (pages 439-452) weakens rather than enforces the author's argument.

The general thesis maintained by Dr. Schurtz is that the existence of "bachelors' houses" and "men's houses" is due to the exercise by the male members of primitive society of a special "social" (as contrasted with sexual) tendency characteristic of that sex. The two sexes differ in their social endowments; woman being notably more inclined to sexual, man more to social ties. Sexual and parental instincts are the roots of the social unions and combinations most characteristically feminine. Woman is the central and inspiring element of family life and of all that for which it has stood, and for which it still stands. Her social impulses require the presence and the foil of the other sex. It is paradoxical, but true, that woman is less social than man. In her fellows of her own sex she sees rather possible rivals in love than companions and equals in social activity. Women meet much less commonly on terms of perfect equality than do men, and the former are notoriously less just to individuals of their own sex than is the case with the latter. This common-sense justice, which men exercise, is a *sine qua non* of the existence of male societies; its absence in so many women accounts for, in part at least, the fact that real societies, not mere imitations of those already formed by men, are rare among women. Man alone seems to create

on a large scale societies from which the other sex is excluded, and in the development of which males are the only human factors. By this means sex rivalry is practically eliminated from the great affairs of men. This is possibly why it is so difficult nowadays for woman to enter some spheres of social and political activity; here the man turns out to be the real conservative. The designation, *e. g.*, of the Senate of the United States or the English House of Commons as a club has more in it than comes to the surface at first. Not only these, but many lesser institutions also, are "clubs," composed of men meeting together on an equal footing, and not devices for making the most of the great society of men and women, which higher object they must sometimes serve. Needless to say, there are often antagonisms between the artificial or secondary social institutions of men and the natural, primary, or sexual societies of women, and of women and men. The "moral sense" engendered by the family instinct, and that which is the product of the "social" instinct of men only, naturally come into collision. The source of much of the ethical dualism of modern public and private life is to be found in the various expressions of this antagonism.

The discussion of the separation of primitive society into age classes brings out many interesting facts which have their analogues in the society of to-day. Many primitive peoples allow the unmarried youths and maidens a sort of "free love," but, with rude justice, make indulgence in it no bar to marriage on the part of either sex; usually, too, the youth marries the particular maiden who has been the subject of his pleasure. Here a marked difference from the procedure of civilized people exists, for with them such action on the part of the female sex removes them from the list of desirable or even possible candidates for matrimony, while men have been in no such measure incapacitated. The history of men's houses, men's clubs, etc., reveals many such discriminations against the "weaker" sex. Lynch law and cognate phenomena in America have light shed upon them in the study of the secret societies of men given us in this book, although the matter is far from being exhaustively treated. Certain traits of our educational institutions of to-day suggest comparison with the associations of youth and unmarried persons, and with the men's clubs and secret societies. The more or less noticeable antagonism between the family and the public school is a case in point, for, in some respects, the latter represents the idea embodied in primitive times in the institutions under consideration. The collision between the morale of the family and that of the college is even more clearly suggestive of the same anterior facts. To the famous saying, *Cherchez la femme*, born of the detective spirit, may be added another, *L'homme seul est là*, expressive of the facts of masculine activity as revealed by sociological research.

A glance into Dr. Schurtz's book will benefit not only the specialist in the field of ethnology, but also the general reader and the average man. A translation (condensed here and amplified there) into English would be a deserved compliment. Since this review was written the news has been received of the regrettable death of Dr. Schurtz.

A History of Factory Legislation. By B. L. Hutchins and A. Harrison. Westminster: P. S. King & Co. 1903.

It is now a century since Sir Robert Peel brought in a bill known as the "Health and Morals of Apprentices Act," and thus began a movement for regulating industry that has spread through the civilized world. Peel said afterwards that he had no difficulty in having his bill passed, and the abuses at which it was directed were so scandalous as to admit of no defence. For, in effect, the parish officers had been selling pauper children into slavery, and the misery of their condition had come to be so widely known as to arouse general indignation. Peel's act, therefore, was intended to improve the administration of the Poor Law, although it was so drawn as to apply to all apprentices employed in factories.

Steam power, the use of which did not fairly begin until the early part of the nineteenth century, but increased very rapidly then, caused great changes in the condition of labor. It is probable that these conditions, on the whole, improved; long hours and unsanitary surroundings prevailed before factories were started. But these factories created, as we say, a great demand for labor, and children became a source of revenue instead of a burden to their parents. Hence, their natural protectors became their oppressors, and the Government was obliged to intervene in behalf of the rights of children in general, whether pauper apprentices or not. Naturally enough, this latter intervention aroused violent opposition. Many parents were exasperated at being deprived of the wages earned by their children; many employers resented the supposed loss of profits gained through these feeble assistants. It was not until 1819 that the employment of children under nine years of age was prohibited, and the hours of work for those under sixteen limited to twelve. At first the law applied only to cotton factories, but it was gradually extended to other departments of the textile industry. The age limit was somewhat raised, and the hours further shortened, while the administration of the law was gradually perfected.

The greatest change, so far as principle was involved, came in 1847. The act passed in that year forbade the employment of women as well as children between 6 P. M. and 6 A. M., with the allowance for meal times; this meant a ten-hours workday. It meant this for all factory hands, for it was well understood that when the women and young persons stopped work, the adult males could not continue. The act met with little opposition on its final passage, owing to the fact that trade was so depressed that few factories were able to work more than seven or eight hours a day. Fortunately, the repeal of the corn laws came at precisely this juncture, and so greatly improved the circumstances of both capitalists and laborers as to make the shorter hours of labor immaterial so far as production was concerned. This factor is commonly ignored in reviewing the factory legislation of England, and the authors of this history unfortunately follow the precedent.

It is still an open question whether, after all, men do not produce more in ten hours than in twelve, or in eight hours than in ten. Some of the disputants calculated that all the profit came in the last hour's work, the production during the previous hours only paying expenses. But as early as 1815 Robert Owen reduced hours from fourteen to twelve, including one and a quarter for meals, and employed no children under ten, with the result that his production was diminished by a mere trifle—a farthing in eighteen pence. He was convinced that it would probably after a time not be diminished at all. Robert Owen was far in advance of his age, but his conclusions were confirmed by the experience of many intelligent manufacturers, and the factory laws seem to have had much support among employers.

It is remarkable that the authors of this book do not perceive a repugnance in their arguments. They maintain that the Government should regulate the conditions of all work, whether in factories or homes, and even prescribe wages, on the ground that unregulated workmen will be used by employers as competitors with the regulated classes. In this way, it is contended, such employers get an unfair advantage. Their cost of production is lower, and their profits larger, so that they can command the market. This view is held so strongly by Mr. Sidney Webb, who furnishes an introduction to the book, as to lead him to declare that "the morass of sweating not only continues, but actually spreads." "The sweated trades remain, at the opening of the twentieth century, as free from any effective common rules as was the factory system at the beginning of the nineteenth." His belief is, apparently, that unless the conditions of all labor are to be prescribed by Government, it is hardly worth while to attempt any regulation. But to supervise all laborers would require so vast an army of inspectors that rulers shrink from the undertaking, while subjects might rebel at such interference with their liberties. The ideal of collectivism thus seems unattainable.

The repugnancy alluded to appears when we find it demonstrated by the facts here set forth, and recognized by these authors as true, that cheap labor is dear labor. No doubt the contrary doctrine is dinned in our ears in this country; but we understand the motives of the cry, and the superior productiveness of our industry has become notorious. It follows that the competition of the weak, dissolute, ignorant, underfed, and diseased laborers is not to be feared by their superiors. To show that industry is most productive in the regulated trades, and then to insist that this industry must be protected against the "sweated" trades is absurd. The latter contention points directly to tariff protection against "foreign pauper labor."

The real issue in the controversies over labor regulation in England has been frequently obscured, and is apparently not understood by the writers of this book. It is not a question of the gains of capital or the productiveness of labor; as Cobden said of free trade, it was not the pounds, shillings and pence that interested him. The

question is whether social improvement will go on more wholesomely and naturally under the influence of men's reason and conscience, or under the compulsion of their rulers. If it be true, as is here abundantly proved, that employers prosper more when their laborers are prosperous, it is certainly not self-evident that this truth would not be practically recognized unless the Legislature enacted it. The condition of the laboring classes in England is shown by recent investigations to be far from satisfactory, and we cannot assume that more factory laws are what is needed to improve it. Other causes also must be considered in explaining such improvement as has taken place.

This history is of value chiefly as showing the fluctuations of public opinion, and of the opinion of particular classes, as the successive laws were enacted. We cannot, however, join Mr. Webb in praising the impartiality of the authors: it is hard to learn from them the real case of the opponents of legislation, and they wax almost incoherent with contempt for the "blank and unfruitful individualism" of the very earnest women who pleaded for what they considered the rights of their sex. We are disappointed, also, in the account given of the progress of legislation. It is with great difficulty that the changes accomplished by each act can be made out, and there is no summary or other statement enabling us to learn what the law now is, how it is enforced, and at what expense, or to how many persons it applies. So strong is the bias of the authors that their work is to be regarded rather as a collectivist tract than a history, although it contains much valuable matter. An appendix by Mr. G. H. Wood, on the course of women's wages during the last century, is well worthy of study.

Out of the Past: Some Biographical Essays. By Rt. Hon. Sir Mountstuart E. Grant Duff. 2 vols. E. P. Dutton & Co. 1903.

These volumes consist of republished papers and addresses of unequal interest. The author's industry, learning, and experience are manifest throughout, and some of the matter is well worth preserving, especially the autobiographical "Recollections of the House of Commons, 1858-1881." This glance backward by a Liberal *emeritus* makes us feel the fitness of the title of the book. We are, indeed, dealing with a past world here, quite as much as we are in the essay on "Senior's Conversations"—a world which came to an end, however, only with the downfall of Gladstone less than a generation ago. The author speaks as an old man, no longer on the stage, whose political principles are in eclipse, but who still has principles and standards of belief and action. He speaks also not merely as a veteran in English politics, but with the cosmopolitan tone which Englishmen acquire who have had much to do with the Government of India. Driven into the Conservative ranks by the split over the Irish question, he found retirement instead of distinction confronting him at the end of his career, and, as he very honestly says, this "was a heavy price to pay." But it has made him more impartial and, we may add, more interesting.

In this address there are a good many striking points—*e. g.*, that unless the country really wants great changes, there must be a sort of paralysis in the party "of change and movement," and that Cobden's views about intervention have on the whole prevailed; the party in power in England for the time having come to drop the old lecturing and hectoring tone in foreign affairs, and to confine its attention generally to actual British interests rather than to doctrinaire or reactionary *Welt-Politik*. It is curiously true at the present moment that the attitude of all branches of the English Government to the United States is very like the attitude which Cobden would have approved, and this, although that Government is willing enough to be made the organ of a protectionist revival. Contrast the relations of the two governments today with what they were at the time of the *Trent* affair; the contrast marks a wonderful amelioration of the old insular Tory tone. The author respects Lord Salisbury's foreign policy, but not Disraeli's. The latter was neither a real Tory policy nor a genuine policy of any kind. It was a kind of sham Imperialism, just as Disraeli himself was a lifelong humbug.

A point is raised here which those who take a serious interest in questions of government will do well to ponder. The author says that no man ever obtained a real acquaintance with foreign affairs without spending a great deal of time abroad. Yet, if we go over the list of Englishmen who have played a spectacular part in Continental politics—Pitt, Palmerston, and Disraeli—we do not find that the influence they exerted was through study of or interest in foreign affairs at all. We might add to the list Chamberlain, who has inherited a good deal of the Disraeli glamour. The author is naïf on this subject. He is an honest rationalist, and forgets that mankind is, as he says on the next page, "a foolish creature." Statesmen of Lord Beaconsfield's calibre always bear this great truth in mind, and act upon it, too. To impute to the creature a constant rationality and rectitude is one of the common infirmities of noble minds. Philanthropists fall into it; politicians avoid it. Disraeli neither believed in man, nor did his followers really believe in him. One of them summed up the controversy as to the comparative merits of the two great rivals by saying, "Well, well, I prefer our scoundrel to your lunatic."

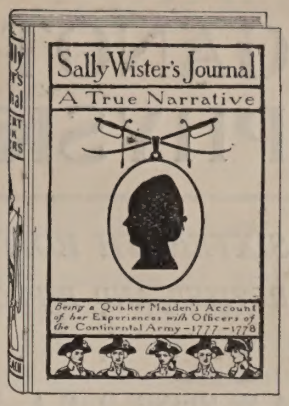
Programmes of the courses offered to graduate students in Philosophy and the Arts and in the department of Medicine, and also of the undergraduate or collegiate courses, will be sent on application to the Registrar.

"Sally Wister is one of those charming maidens whose memory has been preserved,—like that of Dorothy Osborne or the Jessamy Bride,—by a fortunate accident. . . . We profess ourselves her devoted servants." THE ATHENÆUM (London).



Sally Wister's Journal
A True Narrative
Being a Quaker Maiden's Account of her Experiences with Officers of the Continental Army - 1777 - 1778

Sally Wister's Journal

although a strictly historical document, is also a romance of unequaled charm. "The Journal has in many respects the attractions of a work of fiction. In fact, we have had considerable difficulty in persuading ourselves that we are not dealing with a wholly imaginative work. It throws many side lights upon the history of the times, giving interesting pictures of the society of the Revolution. . . . It is one of those books that one needs to read in order to get rid of the unreality that is apt to hang about the pages of history," says the Baltimore *Sun*. "A most delicious piece of literature," says the Philadelphia *Inquirer*. "The love-story is very pretty. This little scene has the color of an artist's interior,"—says the Hartford *Courant*.

SALLY WISTER, 16 years old, daughter of Daniel Wister, merchant, of Philadelphia, kept a journal of her experiences during the winter of 1777-1778, while exiled from Philadelphia during its occupation by the British. The family lived with relatives in an old farm house on the Wissahickon, which was occupied at times by various prominent officers of the Continental army. Sally saw much of the officers and heard much of the fighting, and comments on both freely and quaintly. Gen. Smallwood is "tall, portly, well-made: a truly martial air, the behaviour and manners of a gentleman"; Capt. Furnival, "the handsomest face I ever saw, a very fine person"; Captain Finley is "wretched ugly"; Maj. Stoddert, "very reserved" but has "an engaging countenance and address," etc. Later the Major grows much less reserved. Another officer who throws off his reserve is Capt. Alexander Spotswood Dandridge, of Virginia, a relative of Martha Washington. Sally calls him in the Journal "the handsomest man I ever beheld."

For a picture of this period from another standpoint read

"The Quakers in the Revolution"
By Isaac Sharpless, LL.D.

The second part of "A Quaker Experiment in Government."
12mo, cloth, $1.50.

Carefully edited from the original manuscript by Albert Cook Myers, M.L., who has collected a great mass of material elucidating the text, and also many portraits, relics, documents, signatures and pictures relating to characters appearing in the Journal. Beautifully printed on deckel-edge paper, profusely illustrated, and bound in antique style with a cover design by Walter Whitehead. $2.00 postpaid.

By ANNA ROBESON BROWN

Author of "The Immortal Garland," "The Cosmopolitan Comedy," "Sir Mark," "Truth and a Woman," etc.

The story of a young man's struggle to choose between the material advantages of wealth, questionably obtained and ostentatiously spent, and the higher claims of social service. This novel is a study in temperament and heredity, and a brilliant satire on social conditions in the smaller American cities. But first of all it is an absorbing story, told with remarkable facility and power. The central situation on which the plot turns is one of the most original in modern fiction. Illustrated with full page drawings by A. E. Becher. Cloth, 12mo. $1.50.

Some Famous American Schools

By OSCAR FAY ADAMS

Author of "The Story of Jane Austen's Life," "The Dictionary of American Authors," etc.

A popular account of the foundation, history, and traditions of such noted American boys' schools as Phillips Exeter, Phillips Andover, St. Paul's, Lawrenceville, St. Mark's, Groton, and others. The author's purpose is to supply a readable description of nine American preparatory schools, touching only lightly on their scholastic side, but giving such impressions of each as the average observer would obtain in the course of a brief visit. This is the first and only publication in its field, and is the result of untiring research and correspondence. It is filled with anecdotes of famous events in the academic and athletic life of the schools represented, and is written in a style of unusual charm and distinction. The book is illustrated with more than fifty half tones from new photographs. Cloth, 12mo, $1.20 net.

The Hermit's Wild Friends;

or, Eighteen Years in the Woods

By MASON A. WALTON

A volume of animal and woodcraft lore, by the well-known hermit of Gloucester, Mass. Mr. Walton has contributed for years to *Forest and Stream*, under the pseudonym of "Hermit," and he has also written for the *Youths' Companion* and other periodicals. Thousands of persons have penetrated to his log cabin in the woods, where he has lived entirely alone for nearly a score of years. This book is illustrated in part by the author's photographs of wild creatures which have come under his own observation, and in part by original drawings from the pen of Louis Agassiz Fuertes and other eminent artists. Cloth, 12mo, $1.50 net.

Florestane, The Troubadour

A Romance

By JULIA de WOLF ADDISON

This novel carries the reader back to the Middle Ages with their Courts of Love, minstrels, jongleurs, knights and crusaders, and introduces among its characters Dante, Cimabue, Sordello, and other celebrated men. The atmosphere is that of chivalric ideals with a background of mediæval color and romance. The book is crowded with exciting episodes, and once taken up it will not easily be laid aside until finished. It combines every element of a successful novel, not omitting to mention the mechanical requisites of attractive binding and typography. Cloth, 12mo. $1.00.

The Sweeping Successes of the Season:

Mr. JACK LONDON'S new novel **Third Edition**

The Call of the Wild

Illustrated in colors, $1.50

"The book is exceptionally good . . . . one of the best books of the year. The narrative never ceases to be exciting."—HARRY THURSTON PECK.

"Its romance is fascinating. . . . It takes hold of the attention irresistibly."
—HAMILTON W. MABIE in *The Outlook.*

Mr. JAMES LANE ALLEN's new novel **Third Edition**

The Mettle of the Pasture

Cloth, $1.50

"THE METTLE OF THE PASTURE" as a story, has a heart-break in it, because it is the story of life. Its dominant note is its intense vitality and humanitarianism. The tragedy of life, its failures, its weaknesses; the loneliness and isolation in the life of every soul that is born into the world; the pitifulness of life in its meannesses; the greatness of life in its hopes and ambitions; the austereness of life in its answer to duty; the sacrifice of life in its service to love are played upon, evoking some discord, but striking chords that lift the mind above the slough and strife of the coarse and ignoble, while the strains echo in the ear."
—TIMES-DISPATCH, Richmond, Va.

Now Ready of the ***LITTLE NOVELS BY FAVORITE AUTHORS*** *Five Volumes*

Mr. WM. S. DAVIS'S **The Saint of the Dragon's Dale**
By the author of "A Friend of Cæsar."

Mrs. ATHERTON'S **Mrs. Pendleton's Four-in-hand**
By the author of "The Conqueror," etc.

Mr. CHURCHILL'S **Mr. Keegan's Elopement**
By the author of "The Crisis," etc.

Mr. CRAWFORD'S **Man Overboard!**
By the author of "Saracinesca," "In the Palace of the King," etc.

Mr. WISTER'S **Philosophy 4**
By the author of "The Virginian," "Lin McLean," etc.

Each pocket size but in clear type, attractively bound, 50 cents.

In Preparation: **Miss OVERTON'S The Golden Chain; Mr. HERRICK'S Their Child.**

The Nation.

NEW YORK, THURSDAY, AUGUST 27, 1903.

The Week.

As we anticipated, the prospect of an extra session of Congress in October dwindles under discussion. It is now rumored that even the Senate Finance Committee is unable to agree upon the terms of that currency bill which was so comfortably to be enacted into law before the regular session. This is saying nothing of the difficulty of getting Congress to assent. And they would reckon inexcusably ill who should leave out politics as certain to affect the chances of any important bill on the eve of the November elections. The whole scheme has, in fact, had from the first the air of being a kind of happy-thought statesmanship. Something ought to be done promptly to make the currency more responsive to the needs of trade; therefore, let us all agree that it will be done. But it was a wise philosopher who said that it is a common "solecism of power" to think to attain its end without employing the necessary means. In the case in hand, the means were obviously wanting. It would be impossible, as things are, to induce Western Republicans to agree to those speculative riders which the ingenious Senator Aldrich was proposing to fasten upon the currency bill. With those cut away, his interest was bound to flag, as it is confidently reported from Providence to-day that it has already done.

President Roosevelt must see by this time that there is no such thing as satisfying the Grand Army veterans. .He threw Commissioner Evans overboard, and gave them Mr. Ware, whom, to the alarm of that gentleman's friends, the Grand Army faintly praises. A Commissioner of Pensions who does not receive a certificate of character in the shape of condemnation by the annual encampment is much to be pitied. But the Grand Army is still insatiate. At the same time that, by implication, it censures the President for his treatment of Gen. Miles, it telegraphs him a request to endorse the service-pension scheme. We so call it, for the proposal to bestow a pension on every veteran sixty-two years of age practically amounts to that. No Republican President has yet yielded to that demand. Were Mr. Roosevelt to do so, the Grand Army would simply go on to exact something more, and even more preposterous.

Over-zealous friends of the President have been trying to explain away his action directing the Governing departments to employ union and non-union men impartially. Mr. Roosevelt has been in no such apologetic mood, for he now publishes the identical note addressed to the several departments. In it he calls attention to the finding of the Anthracite Coal Strike Commission, which judged "that no person shall be refused employment or in any way discriminated against on account of membership or non-membership in any labor organization"; and declares that it is "mere elementary decency to require that the Government departments shall be handled in accordance with the principles thus clearly and fearlessly enunciated." In this matter the President is on so firm ground that he need not fear the machinations of enemies who seek to put him in the light of an opponent of the labor unions. Naturally, he has taken his course with little parade, for it is probable that the cases of discrimination in favor of unionists are few and unimportant. It is the principle that is important, and the President has shown courage and statesmanship in refusing to let the unions hope for a moment that the nation will aid them in coercing unwilling workmen into the ranks of organized labor.

The conviction of Parks, the labor blackmailer, is a most salutary event. To the great advantage of the community, the jury took a large view of its duty. By its verdict, it stamps Parks not only as an extortioner but as a shameless perjurer. It holds him up to his fellows as a man who cannot be believed on oath. If the jury had placed the slightest credence in the testimony which Parks gave so unblushingly, it would have acquitted him. But the honest good sense of the jurymen was evidently affronted by the impudence with which he perjured himself, as they were plainly convinced that he did. This, then, is the man who has been taking the building trade of this city by the throat, opposing the plan of arbitration to which the majority of the unions was ready to assent, and plunging thousands of workingmen and their families into acute distress. A jury of his peers has pronounced him a forsworn criminal. The duty of organized labor in New York is plain. Unless it wishes to condone crime and to identify itself with the unlawful methods of a convicted swindler, it will disown him and all his works. The building trades unions now have an opportunity to rehabilitate themselves by repudiating Parks; but we do not believe they will embrace it.

Before Secretary Hitchcock of the Interior Department retires from the Cabinet, we trust that it will be made clear what he goes for. Is it to be on account of alleged frauds in the conduct of Indian affairs and the reported withholding of money received from the sale of public lands and intended for local improvements, or because there are factional squabbles among Missouri Republicans? The tone of an interview last week with R. C. Kerens of St. Louis leads to the conclusion that, so far as this eminent statesman is concerned, the accusations of maladministration charged to the Secretary are as nothing compared with the "good of the Republican party in Missouri." This Mr. Kerens thinks would be served by Mr. Hitchcock's retirement. The charges made against the Secretary, however, are of the most serious character, and require, as we have no doubt they are receiving, the closest scrutiny and investigation. The Secretary's answer, alleging that contracts for the public improvements in question were tainted with fraud and were therefore cancelled, should also be inquired into. What the exact situation in his Department is, it is extremely difficult to say. Were all the rumors afloat to be believed, there would be reason to foresee revelations at least as grave as those in the Postal Department. The arrest on Monday of the United States Marshal for the Indian Territory, Benjamin H. Colbert, lends a very serious color to many of the allegations. This official is accused of using his power for political purposes. Letting prisoners out of jail that they might vote was one of his pleasing pastimes; imprisoning Indians for not voting according to his wishes, another. This arrest may open the way to a general uncovering of the land ring which has sought to profit by the allotment system.

The official announcement that Governor Taft is to succeed Mr. Root as Secretary of War will be most unwelcome news in Manila. The Filipinos have come to regard Mr. Taft as their one safeguard against the conscienceless American adventurers who seek to exploit the islands without regard to the "niggers." The Americans who have heaped abuse upon Gov. Taft for his bold declaration that his administration was run primarily in the interest of the Filipinos, will greet the news with unconcealed joy. But one so devoted to his duty as Governor Taft can hardly have been prevailed upon to change the scene of his official activity except on the assurance that he will still largely control the destiny of the Philippines from Washington, that a worthy successor is at hand, and that his health demands

his return. How the army will accept the change of head remains to be seen. With Secretary Root the service will part most reluctantly.

We can fancy the disgust with which the "stand-patters" will receive the intelligence that they must prepare to do battle with a new demand for tariff revision, this one to be known as the "Minnesota idea." It does seem a pity to disturb them again so soon. They had just settled down comfortably after their tussle with the "Iowa idea." In that, we admit, they came off rather well. It would, in fact, take a microscope to discover what remained of the "Iowa idea" after they had done with it. Under the circumstances, they had a right to expect to be let alone for awhile. But here comes a disturber of the peace from Minnesota, a Republican State Senator who has the effrontery to discuss national affairs, and declares that Minnesota wants the duties lowered on lumber, steel, and other commodities. He also says that the West ought to force the issue upon the attention of the next National Republican Convention. All we can say about this State Senator is that he is evidently an upstart and no real Republican. Such talk as his is absolutely dangerous. Nobody knows what may come of it. Does he want to stab Prosperity in the back?

The negro business men assembled last week in convention at Nashville have surprised observers by the "sanity, business-like brevity, and common sense" which have distinguished their meetings. Southern listeners in particular could hardly credit the statements of the successes achieved by some of the delegates. But any Northern observer who makes a study of Southern conditions must be struck by the ignorance of many white men as to what their colored neighbors are doing. In some cases this is wilful blindness; in others it is due simply to the complete separation of the races. We have in mind a prominent Southern banker who last spring declared that the negro was good only for field work or for household service. Within a few blocks of his home there were several negroes who were doing a business of more than $10,000 a year, and one who took in $25,000 annually. One of the strongest banks in his city is conducted by colored men—but of this the white banker was totally ignorant. One of the purposes of the Negro Business League is to let the world know what its members are doing, as well as to encourage their race in toiling upward. The successful men are few in number as yet, but they increase year by year, and invariably win the respect of the better class of white men. Now, when the negro is spoken of as a race, the vision which rises before the average Southerner's eyes is of colored town-loafers or the ignorant and often animal-like plantation hands. Before long, we hope, the vision will include also the law-abiding, self-respecting, independent negro business man.

The Boston *Herald* calls attention to the freedom of opportunity in which the negroes of Cambridge, Mass., rejoice. The city bacteriologist is Dr. William C. Lane, a colored physician. Mr. William Henry Lewis, the Harvard football coach, is now Assistant District Attorney of the United States, after three terms in the City Council and one in the Legislature. Miss Maria L. Baldwin, the head of the Agassiz school since 1889, has six white teachers and several hundred white children under her. Horace J. Gray, a real estate broker, has been commander of Post 30, G. A. R., a white post, with hardly another negro in it. Clement G. Morgan, orator of his class at Harvard, has served five terms in the City Council and Board of Aldermen, and was barely defeated for a seat in the Legislature. The Rev. J. H. Duckery is the colored member of the Board of Trustees of the Public Library. As far back as 1870, a colored man, Patrick Henry Raymond, became chief of the Cambridge Fire Department, in which there was, at that time, no other man of color. A colored policeman has served for nineteen years without ever receiving a reprimand or punishment, and, in all, seven colored men have had seats in the City Council. To this must be added that the spirit of good citizenship is more keen in Cambridge than in most American cities.

Jefferson Sanders, a negro, on May second shot three policemen in a barroom row in this city. Two of the wounded men died. Sanders was promptly arrested and confined in a hospital and in the Tombs until Monday of last week, when his case was brought before the grand jury. That body spent two hours investigating the case and hearing witnesses, and then dismissed the complaint against Sanders. It was shown that he had been badly beaten by the policemen, and that he had drawn his revolver in self-defence only after one of the policemen, Sergeant Gilhooley, had drawn his. We cite this case in order that our foreign critics may know that a negro can still obtain justice in certain portions of the United States. Had the shooting occurred almost anywhere in the South, or in Wilmington, or some cities of Indiana, Sanders would probably have been hunted down by a posse and shot at once because of his color. The Danville riots, it will be remembered, arose out of the shooting of a policeman by a negro, who was himself mortally wounded by his victim. The New York method of investigating such crimes in accordance with the judicial procedure prescribed by law, and without a display of racial prejudice, is the true American as well as the only civilized method.

The latest issue of the illustrated supplement of the *Tageblatt*, one of the most influential newspapers in Berlin, contains a picture of the lynching of a negro in one of the "small North American cities." In the crowd about the hanging negro are policemen and a multitude of small boys. The *Tageblatt* explains the picture in the following words: "The freest nation in the world is anything but the most tolerant, and when it has to do with the negro it is intolerant to the extent of the crassest injustice. The colored man, in the eyes of the full-blooded Yankee, is a second-class man, hardly as important as an animal, with which one would sympathize much sooner than with a negro. Woe to the negro who has aroused the anger of his fellow-citizens by a misdemeanor or a crime." In this case, the *Tageblatt* says, the jail is always stormed and the negro hung to the nearest tree with the connivance of the local authorities. Exaggerated as all this is, it is none the less the view which foreigners are rapidly coming to have of us. Our good name abroad depends upon our putting down lynching. Until then we can only reply to our foreign critics by citing to them the deeds of the sheriffs who defend their jails, or the heroic attitude of the Texas father who saved from the mob the negro who assaulted and probably fatally injured his daughter.

Denver's new charter, which has been framed by a non-partisan convention and will be submitted to the voters for acceptance or rejection on September 22, embodies the tendencies which have been apparent during recent years in municipal government, especially as regards the safeguarding of franchises and the centralization of responsibility. The city and county of Denver have now been made conterminous, and the Mayor's control over executive departments under the new charter will extend even to the appointment of the Sheriff. The only elective officers, in fact, are the Mayor, Treasurer, Auditor, and Assessor, besides the councilmen and judges. The charter-makers were warned by New York's experience against the bicameral municipal legislature. A unique provision is that which makes it possible for an elective officer to be removed by a petition of 30 per cent. of the vote cast for him. In respect to the granting of franchises, the proposed charter goes even farther than the Rush bill, which first gave Denver home rule. Not only can no franchise be granted until after it is submitted to popular vote, but the franchises so granted are still

subject to "amendment, alteration, and repeal" by the same authority. Corporation interests have promptly attacked this feature of the charter, although the Colorado Legislature has long had the same power of amending State grants. It may be, as some of the charter's defenders have suggested, that corporations find their interests cared for more tenderly by the Legislature than by the entire body of voters.

One effect of reform primary laws will be the exposure of actually corrupt methods for controlling nominations. These have unquestionably been in vogue more or less in every State of the Union, but as long as the primary remained exclusively a party affair, bribery and coercion were kept well under cover. Even under our own law, which in some respects is quite modern, no opposing inspectors are present at the primary, and the will of the machine leader can be accomplished practically without detection or publicity. But all is made plain when both sides are represented. Thus, in Maryland, where a contest is in progress under the new primary law for control of the Republican organization, the faction supporting Senator McComas and that which is favorable to Representative Mudd are loudly accusing each other of bribery; and in their case they have the specifications with which to prove it. No one familiar with Maryland politics will be surprised, or will doubt for a moment that substantially the same evil conditions existed under the old law, including the actual purchase of votes. But the exposure is unprecedented. This may be put down to the credit of the new law, and it is morally certain that as a result the evil must diminish from year to year.

For a man who a few weeks ago professed complete indifference to the Governorship nomination, Mayor Tom L. Johnson of Cleveland is conducting a pretty stirring campaign. In every Democratic county convention held recently in Ohio, the contest for delegates between John L. Zimmerman and Mayor Johnson has been of the fiercest character. In some of the counties where Zimmerman delegates were selected before Johnson came actively into the field, efforts are now being made by the Mayor's friends to have the conventions reconvene and other delegates chosen. In nearly every county where it has proved impossible to defeat Zimmerman, the basis for a contest has been carefully prepared by Johnson supporters. This not only will permit the unseating of Zimmerman delegates, but may give the Johnson faction control of the Committee on Credentials, since, under the rule, no county where there is a contest may have a representative on this committee. These methods did not originate with Mayor Johnson, but it is somewhat surprising to find him making use of them to secure a nomination which he had declared he would accept only if tendered in such a way that he should deem it his duty to obey the imperious and united voice of his party.

At least one "Chamberlain Leaflet" has floated across the Atlantic. It is called "A Lesson from America," and aims at proving from the experience of the United States that England ought to abandon free trade. The method employed is that of the rawest stump-speaker. It takes a few statistics, on the "before-and-after" plan of the patent-medicine advertisements, and parades them, all crude and bleeding as they are, as if they were proof. Thus, the fact that a million more men were employed in manufacturing industries in 1900 than in 1890, is attributed entirely to our protective tariff, as is also the increased production of iron and steel, etc. No analysis, no comparisons, no allusion to the fact that similar if not greater progress was seen in this expanding country under the so-called free-trade tariff of 1846, no reference whatever to our vast system of internal free trade and our rich territory to be developed—nothing but just an unmeaning array of figures. In this country such reasoning has fallen into deserved contempt. Our most ignorant voters cannot any longer be tricked by it. We think too well of British workmen to imagine that they can be taken in by such transparent fallacies.

With Lord Salisbury passes the last of the great aristocratic Prime Ministers. Born an aristocrat, he never wavered in his belief in the right of his class to rule. On one occasion, indeed, he defended the House of Lords with an argument which Gladstone, in his most casuistical moments, might have envied him: he said that it was an ideal Upper House, precisely because its members were generally absent, frequently timid, and universally retroactive. Unquestionably his innate aristocracy was greatly reinforced and deepened by his dislike of the older liberalism and by his distrust of modern tendencies. It thus has very interesting analogies to the neo-Catholicism of the Puseyites or to the pre-Raphaelitism of Holman Hunt. Lord Salisbury was eminently of the "Victorian age." Indeed, many of his personal characteristics and prejudices were precisely those of his sovereign. One can but marvel at the fortune which made Gladstone the life-long antagonist, and Chamberlain the ultimate ally, of Lord Salisbury. For, if the impetuosity and popular qualities of Gladstone were profoundly antipathetic to the Tory leader, there was between them a real tie in character and in scholarly tastes. At some future time diaries and reminiscences may tell us what it cost Lord Salisbury in his personal pride to buy the Liberal Unionists at the cost of a portfolio to Chamberlain; but already it appears that no compromise, among his many, was paid for so tragically. The great Foreign Secretary of his time was to end a brilliant series of diplomatic successes by shouldering the responsibility for Mr. Chamberlain's reckless and disastrous negotiations with the Transvaal.

In view of the uneasiness created some three weeks ago by the rumor that the German Government contemplated an army increase of 9,000 men, the news that it is actually planning for 39,000 more troops was bound to have a depressing effect upon the public mind, as well as upon the Boerse. This may be looked upon as the Emperor's defiance of the Social Democrats. There is no stronger plank in that party's platform than the one denouncing militarism. Its leaders have never failed to recognize and point out the evil influence the standing army has upon the industrial, social, and moral welfare of the nation. At the last elections nearly one million citizens joined their party, which polled far more votes than any other, and now numbers a full three millions. Yet the Government is willing to go right on with its policy of enlarging the army, although quite aware that the new demand will precipitate a very bitter fight in the Reichstag, likely to overshadow all other issues. As for the reasons offered by the General Staff for this increase, they are of the flimsiest. It can get the men, and therefore it ought to have them. Even with them the army will be but one-half of Russia's. But when the Emperor's army is half the Czar's, it will be found necessary to have it at least three-quarters of the size of the Russian hosts. This game can be played indefinitely—until an overburdened people revolts.

Fighting is reported from widely scattered regions of European Turkey. Along the line from Uskub, in old Servia, to Salonica, on the Aegean, several collisions between the troops and revolutionists have taken place, while the news of burning villages on the Black Sea indicates that the presence of the Russian squadron has either incited the revolutionists to action or the Turks to outrage. Caught between pressure from abroad and increasing disorder at home, the Porte has naturally granted the demands of Russia for satisfaction for the killing of a consul. This specific demand is accompanied by stipulations for the reform of Turkish administration of Albania and Macedonia, and it is most unlikely that Russia will in this matter accept mere assurances.

THE PARTY BUGABOO.

The cry that a wicked Republican conspiracy lurks behind the proposed renomination of Mayor Low, is finding some echoes. A good deal of feigned and perhaps a very little genuine alarm exists about the alleged Roosevelt-Odell-Platt plot. This is, to pose as non-partisan Fusionists for the Mayoralty campaign alone, and then, in a Presidential year, to throw off the mask and "seize" this city in the name of the Republican party. "Well, if it comes to that," some Democrats are saying, taken by the lure, "this is a Democratic city, and will not allow itself to be Republicanized by trickery. Let the Republicans join in nominating an independent Democrat as Mayor, and then perhaps we'll believe them sincere."

So here we are, if these men could have their way, plunged back again with our city elections into the partisan morass. The new Constitution of New York, carefully separating city from State and national elections, drew us out of it, or aimed at doing so, and great was the rejoicing. We were going to be able to set city issues sharply off by themselves. We were to be allowed to stand Tammany up by itself, in all its native ugliness, stripped of every rag of party disguise, and to permit the people to vote directly and solely upon the question of turning the city over to organized loot. But all this chapter of our history, with the long struggle to secure such happy electoral conditions in this metropolis, would now be coolly blotted out by the men who can see in the impending contest nothing but a manœuvre for party advantage. The crafty insincerity with which this partisan color is given the matter by the open or secret allies of Tammany, is obvious enough; but, as some well-meaning people are taken in by these schemers, it is worth while asking what the facts really are.

First and foremost stands the undeniable truth that Mr. Low has not been a Republican Mayor. He has been true to his pledges, and administered the affairs of the city in a non-partisan spirit. The mistakes he has made have not been the mistakes of a partisan. He has allowed no machine to dictate to him. Platt has openly lamented that he could "get nothing" from Mayor Low. Sheehan and Ridder have paraded their hurts in the way of patronage refused them. In other words, the Mayor has distinctly *not* used the offices during his first term in the way in which it is asserted he surely will in his second. He has not even allowed the Citizens' Union to control his use of the appointing power; and certain disappointed gentlemen in that organization are now, in consequence, filled with painful doubts concerning Mr. Low's eligibility.

The simple fact is that no one can dispute the assertion that Mr. Low has honestly lived up to the platform upon which he was elected. He has been a non-partisan Mayor. That he is a Republican in the politics of the State and the country is well known; but where is the evidence that his party affiliations have swayed him as Mayor of New York? The evidence is all the other way. It is said that he presided at one of Gov. Odell's campaign meetings. Now, we frankly say that we think a nicer delicacy on his part would have led him to refrain from taking so public a part in the State election; but it does not lie in the mouth of his newfound partisan critics to blame him for that. Their theory has been, or pretended to be, the same as his—namely, that a stout party man can yet be a non-partisan in city politics. It was upon that basis alone that we pleaded and labored for separate municipal elections. Now that we have got them and they have worked so well, are we going to insist upon wallowing again in the old mire? Have we got to let the city go to ruin simply because to keep it decent this year might possibly help some political party next year? Are Tammany burglars to be allowed to break into the City Hall again, using the old party prejudice as a jimmy? We had fondly hoped that we had outlived that folly.

But, it is reiterated with sinister emphasis, President Roosevelt is interested in Mayor Low's reëlection; so is Gov. Odell; and that proves the Republican conspiracy. Well, so is the entire press of the country interested. From Oregon to Florida, newspapers are intently watching to see whether New York is going to lurch back into the Tammany slough. What friend of good government can help being interested? According to these over-astute discoverers of a party plot, Messrs. Roosevelt and Odell should have relieved themselves of suspicion by coming out openly with the hope that Low would be beaten! But granting that these party leaders expect a certain advantage from the success of Fusion once more, in what can it consist? Plainly, in the continuance of good government, nothing more! Mayor Low in office next year would not lend himself to partisan intrigues any more than during the past two years. That is admitted. The independent Democrats who are so nervous about his renomination confess that he has been "honest." But do they not see what a terrible implication against their own party they tacitly make by their position? It is that Democratic party advantage can be won only by surrendering New York to Tammany. Throw the city to the wolves and then we may hope to elect a Democratic President; keep it clean and safe, and there is no hope for us! Call you that supporting your party?

It is difficult to discuss this absurd dragging out of the party bugaboo with patience. In so far as it is not a transparent trick, it is a foolish misconception. No national party can "seize" this city. It is entirely possible that Mayor Low may carry it next November by 30,000, and the Democrats by 75,000 in 1904. They did last year by 122,000, and what did Mayor Low do, what could he have done, to prevent them? There is a great body of independent voters in New York who can be neither hoodwinked nor coerced. What they are most anxious for just now is a chance to express themselves again on the naked question of an honest city government; and we are convinced that all these attempts to make this year's city campaign a "first gun" in next year's Presidential election, simply fill them with disgust—as they do all who have the city's welfare at heart.

CONTRACT LABOR IN HAWAII AND ELSEWHERE.

Under the auspices of the American Economic Association there has been published a 'History of Contract Labor in the Hawaiian Islands,' by Katharine Coman, Ph.D. It is an excellent example of a certain kind of so-called economic or historical writing to which the public is now treated, and which, when carrying the imprint of some society or association, often passes for a really scientific and authoritative utterance. The author of the pamphlet before us belongs to a naïve school of investigators. Her principal sources of information are "many of the men who have been directly responsible for the laws under which the industrial possibilities of the islands have been developed." "The student of this phase of Hawaiian history," Miss Coman says, "may therefore congratulate himself on securing the aid of living authorities so wise and so trustworthy." With the author's point of view and bias so clearly stated in the preface, it is not surprising to learn later that men who were instrumental in bringing in South Sea Islanders as contract laborers should not be judged by any outside opinion of their activities, "but by their own statements."

At the same time, the point of view from which this monograph is written lends a certain value to it. Here we have contract labor as set forth by its loving friends. No breath of criticism, no question as to its beneficial effects upon the social and political life of Hawaii, has found entrance to its pages. At this moment, therefore, when the cry for forced labor is heard in the Philippines and South Africa, and is even advocated for our Southern States by a prominent Brooklyn clergyman, it is worth more attention than its intrinsic value would warrant. Moreover, as Miss Coman explains, the experience of those Americans who undertook to exploit Hawaii

in the name of the Great Jehovah and the almighty dollar, is peculiar in that they enjoyed practically absolute immunity from any outside interference for seventy-five years.

"Within the cycle of a hundred years," Miss Coman states, "a primitive agricultural community has been transformed into a highly specialized industrial system, in which every capacity of land and people is subsidized for the promotion of a single product." In other words, everything in Hawaiian life has been subordinated to the needs of the sugar plantations and their owners. Under this kindly rule the native population has decreased from 142,000 to less than 30,000 of the pure native blood. By 1850 this disappearance of the Hawaiians was great enough to deplete the labor market, and there began the first of a long series of importations of South Sea Islanders, Chinese, Japanese, Portuguese, Germans, Scandinavians, Italians, Galicians, Americans, and, lastly, Porto Ricans. But the appetite of the plantation owners was never satisfied for long, after the legalization of two forms of contract labor in 1850. Their chattels were bound for not more than ten years, the remuneration ranging from three dollars a month up; and one hundred and fifteen thousand laborers were actually imported between 1850 and 1897. The better class sought employment as artisans when freed, few Portuguese and Germans, for instance, reëngaging on the expiration of their contracts—plain proof that the status of an indentured laborer was no more tolerable to them than was the colonial system in Virginia to Englishmen who were practically sold into it in their fatherland. In the matter of the Chinese alone were the planters balked in their desires, and then only temporarily. In 1886, against their earnest protests, a rigid exclusion act was passed. As a sop to the sugar-growers there were imported some 3,000 Japanese coolies, but subsequently the Legislature permitted the admission of Chinese as agricultural laborers only, for a term not exceeding five years. If found in any other occupation, they were to be arrested and returned to China. No less than 20,000 Japanese came in during 1899.

The immediate effect of annexation to the United States was the legal prohibition of this contract labor. At once there were twenty strikes among the plantation laborers, whose ingratitude to their previous employers is thus manifest. Even if it be true, as Miss Coman alleges, that the penal enforcement of a labor contract is "inconsistent with the trend of modern labor legislation," the laborers should have recognized that, after all, their employers were actuated solely by the most humanitarian motives, and should have kindly refrained from thus expressing their dissatisfaction. How could society secure itself, Miss Coman asks, if the laborers had not been held to the plantations by labor obligations, and how otherwise could the laborer, "guiltless of property and in debt for his passage money, secure his master against breach of contract"? This was the proper reply to all charges of "man-stealing" and "slave-driving." But we must do our economist the justice to state that she reluctantly sees in the abolition of contract labor a sign of our progress towards a higher industrial order of affairs.

Contract labor is as much an anachronism at this stage of the world's progress as it was when John Stuart Mill wrote his 'Principles of Political Economy,' and declared against persons binding themselves by contract "to continue doing something for a prolonged period." Whether in the Philippines or in South Africa, behind contract labor proposals, with all their assurance of an increase of national wealth, there lie boundless greed and the readiness to sacrifice human beings to the desires of a few wealthy men or syndicates. An English writer in the *Fortnightly Review* admits that forced labor for individuals "savors of slavery," but he would have the State itself place all the young native South Africans in barracks to train them in habits of industry. Professor Jenks of Cornell would have contract Chinese laborers taken by the thousands to the Philippines. The game is the same, whether played in Hawaii, in South Africa, or in our own far Eastern islands. First rob the native of his land. Then, if he will not work as hard as you wish him to, import thousands of coolies, so that all the wealth possible may be garnered from his lands. In the process pay no attention to the rights either of natives or of the imported laborers. Consider them not as human beings with human rights, but merely as means to an end—to be contemptuously flung aside when your sugar crop is grown or your diamond mines exhausted.

SOCIETY'S RIGHT TO KNOW.

Mr. Justice Mayer of the Court of Special Sessions, before whom most of the proceedings of inquiry into the alleged derelictions of city officials have been instituted, has handed down a remarkably clear and convincing opinion dealing with the validity of the so-called "John Doe" investigations before magistrates. His decision is a vindication, so far as his authority extends, of the right of society to find out in its own way whether a crime has been committed, and, if so, who, without palpable injustice, may be formally accused of being its author.

Much that has been declaimed in public about alleged violation in these proceedings of the rights of accused persons, and the invasion of the personal prerogatives of individuals, is shown by the decision to be mere froth. "The law," says Justice Mayer, "has thrown about a person accused of crime safeguards at every point, so that persons shall neither be apprehended nor placed on trial except with caution and deliberation." Before a warrant may issue or an arrest take place, the magistrate must be satisfied that the crime complained of has been committed, and that there is reasonable ground to believe that the accused perpetrated it. One can be held for trial only if it appears on examination, in which the rules of evidence are adhered to and the accused may be represented by counsel, that there is sufficient cause to believe him guilty. If held for a felony, he cannot be tried until indicted by a grand jury. To all this the "John Doe" proceeding, so-called, is a mere preliminary. Though it is instituted only after what is known as a "criminal information," there really is no defendant. The machinery of the court has been set in motion, not to pass judgment upon anybody, not to convict anybody of a crime or to inflict punishment upon anybody, but merely to find out certain things which society for its protection is entitled to know.

That the secrecy of the mere preliminary inquiry has a double purpose, one phase of which is for the protection of the personal rights of an accused person, is made clear by Justice Mayer. These purposes, he says, are, "on the one hand, to prevent the defeat of justice by the flight of the accused, and, on the other, to protect the accused against wrongful accusation or apprehension." The importance of the latter has not escaped the attention of the lawmakers or of the criminal courts, though counsel for Mr. C. F. Murphy, on whose account the proceedings in question were instituted, appear completely to have ignored it. It is a fact, however, that the power of a magistrate to institute a secret inquiry is almost daily used for the protection of accused persons. In the heat of anger, or moved by baseless suspicion, men and women apply to magistrates for warrants of arrest. The justice has no means of knowing whether their stories are true or false, accurate or grossly exaggerated. If he refuses a warrant, some guilty person may escape; if he issues it, some one who is innocent may be branded as a supposed criminal. The magistrate accordingly neither refuses the warrant nor issues it. He sends for witnesses. He examines them without publicity. Nothing which they say can fix conviction upon the accused. It can merely meet the doubt in the magistrate's mind whether the crime has really been committed and whether the arrest of the right person is asked for.

Reduced to these simple terms, it is plain that no injustice is done the ac-

cused though he be absent and unrepresented by counsel. Were this form of procedure abolished, the alternative would be to arrest him on suspicion, at grave cost to him if he were innocent. There could be no third course, for it is unthinkable that society should content itself with punishing only those crimes which are committed without attempts at concealment. Such contentions as that allegations made only on "information and belief" are insufficient to confer jurisdiction upon the inquiring magistrate, or that the District Attorney's representative has no right to be present, are seen to be mere quibbles in the light of the analysis given by Justice Mayer. Anybody may be present who can aid the magistrate in answering the fundamental question which is before him, and anybody whose presence would retard that determination or render it useless when made, can properly be excluded. Society is merely exercising its right to know, a right which is necessarily paramount.

Of course it is not contended that this power of inquiry cannot be checked and restrained when it invades the substantial rights of individuals. For instance,, it is fundamental law that no person can be called upon to give testimony tending either to incriminate or degrade him. But this does not mean that a witness may refuse to answer questions aimed to bring out the guilt or innocence of his "friends" or his associates. "The privilege of withholding information in the possession of a witness, not implicating himself, and of which the public good demands the disclosure, can challenge no sympathy," said Judge Edmond, in the case of The People v. Hicks, in which this question was raised; "and, it seems to me, is entitled to no favor."

EDUCATION AND JOURNALISM.

In a discussion of the courses for students of journalism established a year or two ago at the University of Chicago, one of the noisy newspapers professed itself unable to see any need for such a school. What will it avail an intending newspaper man, it asked, to learn the history of Zanzibar or the internal politics of Korea? There were, in its opinion, only one or two journals for which such information had any value, and of these "no editors ever died." There was just sufficient truth in the statement to have made it worth considering by the authorities of Columbia before accepting the Pulitzer foundation for a school of journalism. What *are* the opportunities which will present themselves to the graduate when he seeks to make use of his newly acquired knowledge in the newspaper world?

He will find, first of all, that the profession bears in many of its aspects a growing resemblance to a trade. More and more men own newspapers in order to profit from them as they would by the sale of patent medicines or of boots and shoes. It is a commonplace that newspaper proprietors are far more concerned to-day with the sums which can be made out of their properties than with the opportunities they may have to enunciate political principles or to insist upon high ethical standards in our national life. The outgrowth of this business journalism is the "up-to-date" newspaper, as it calls itself, which cares as little for accurate and painstaking knowledge as it does for the feelings of the persons with whose misfortunes or notoriety it fills its pages.

Are the graduates of the Columbia school to be fitted for a life work of this kind? It might smack of ingratitude if they should not be, but manifestly they will not be if the university course is to set store by such things as decency, good taste, refinement, and high ideals. The ultimate aim of all education, and particularly of collegiate instruction, is the building up of character. If the Columbia school is successful in this respect, most of its graduates will prefer snow-shovelling to a service which knows little or nothing of conscience and truth-telling, which does not dare say that its soul is its own if the "business office" issues its orders, and which demands of its young men that they shall give pages of space to the latest prize fight, or to the most recent scandal among the ignorant rich. Your truly educated man will spurn offers from the blatant journals, or even from those outwardly respectable newspapers whose opinions are subordinated to their money-making purposes. He will ask with Lowell: "Why shall a man go down to live in his cellar, instead of mounting to those fair upper chambers which look towards the sunrise?"

"Such a school," writes a valued and experienced correspondent, speaking of the Pulitzer foundation, "to be really useful, should teach the opposite of everything that the *World* has been or now is." If it does so, its graduates will, of course, still find many positions suitable to their taste and inclinations. But these openings, if not declining in number, are certainly limited, and will continue to be unless public opinion cries out against those who pander to the basest tastes of the multitude. Instead of entering journalism for a life's work, they will go to the magazines, into publishing-houses, into Government positions—into anything where their training and knowledge of American political institutions will render them of value.

It might almost be said that it is the newspaper-reader who needs to go to school, and not the newspaper-maker. Let the reader but learn to discriminate between honest and upright newspapers and those that sell their opinions as they do their advertising space, and the uplifting of the profession will come quickly enough. For if newspapers create public opinion, they are also singularly sensitive and responsive to it. A general refusal to buy or advertise in a newspaper which persistently sins against good taste and decency, would do far more in a month to "tone up" our daily press than would the graduation of hundreds of "bachelors of journalism," unless some in each class had, in addition to high ideals, the large sums now necessary to found and conduct modern daily newspapers. Until graduates can be assured of prompt and congenial employment upon our daily press, it is absurdly optimistic to say that the creation of a single school insures the "uplifting of the profession" to the position now held by members of the bar or doctors of medicine.

Certainly, the period of transition through which journalism is now passing deserves more attention than it receives. Is the newspaper of the future to be solely a money-making affair or the organ of some wealthy man; or is the press to continue to hold a high position as the greatest safeguard of our American institutions and liberties? These and other questions confront all who would read the future by the past. There is much comfort to be found in the fact that men who have no purpose save to state the truth as it appears to them, are constantly embarking upon new if small ventures, that our technical press gains steadily in dignity and influence, and that our respectable dailies have little difficulty in maintaining themselves despite severe competition. Such papers do not need to recruit their forces from schools of journalism.

MARTINIQUE REVISITED.

PHILADELPHIA, August 20, 1903.

Not quite a month after the first anniversary of the destruction of Saint-Pierre, I again set foot on Martinique soil. A torrid sun was beating down upon the prairie-like *savane* of Fort-de-France, and the tall and richly umbered royal palms that shadow the statue of Josephine had already long begun to show the passing of the rainy season. This is the hot side of the island, and if a temperature of 86 or 87 degrees carries with it no particular terrors, and is not uncommonly high for a region that lies only four hundred miles from the mouth of the Orinoco, it is still something that warns, and compels consideration where an unusually high degree of humidity pervades the atmosphere. There were not many people about, and the city of 12,000 inhabitants showed its usual appearance of monotonous decay. Fort-de-France is perhaps as intensely uninteresting as Saint-Pierre was the reverse, and even now, when it has entirely replaced its fairer sister as the centre of population of the island, it does nothing to relieve itself of the air of weariness which is its chief characteristic. I found no change in the doings of its people since Sep-

tember. Newspaper politics were, as heretofore, running high, and the editorial columns of *L'Opinion* and *La Colonie* were waging the old "war of races." The volcano was still a part of the hourly food, and its workings were officially chronicled almost daily; but there seemed to be few who were more than passively interested in the extraordinary structure that it had developed—the gigantic obelisk of rock which transfixes the crater-cone, and, like a veritable Tower of Babel, towers over the summit of the mountain to a height of 800 feet and more. And, incredible though it may appear, there are still hundreds and thousands of the inhabitants who to this day have not visited Saint-Pierre.

The silent city remains much as it was at the time of my last visit, nine months before. A litttle more ash has accumulated here and there, and some of it has been taken off elsewhere; but the ruins are the same battered, crumbling walls, unchanged save that they have gained in color through the washing off of the ash-mud that plastered and cloaked their vertical sides. In a few places excavations were being made to recover "treasure" or to locate sites, but the prowlers among the dead were few, and what was recovered was in most cases insignificant. I turned over some rubble-masses beneath which "caked" and burnt papers were projecting, and found that I was dealing with a lesson in geology, and, strangely enough, with one that taught of volcanoes and volcanic phenomena. Several pages of manuscript, possibly escaped from the Lycée or the Communal College, covered with teachings of Vesuvius, Cotopaxi, and Etna (and of Pelée?). It may be that those papers were dictated by the impending storm of Pelée, but who can now tell? The fragment of one of the few books recovered from Saint-Pierre—whose precious brown pages I owe to a friend—deals likewise with volcanic phenomena. It is the 'L'Enfant du Vésuve,' supplemented with a very full account of the destruction of Pompeii, and with a carefully rendered translation of both of Pliny's letters.

One significant change has come over Saint-Pierre. It is no longer an absolute desert, for little colonies of ants and other insects are inhabiting the ruins, and the land-snail has come to live with them. Green creepers and many plants with bright flowers here and there hang about the battered masonry, and from some of the old gardens rise up stocks of the *chou caraïbien* and the banana. And even the few trees that have been left standing on the surrounding heights, and thought to be dead, have sprouted out new leaves, and give a new sunshine to the landscape. Well up on the volcanic slope, beyond the Roxelane, and quite to the Rivière des Pères, these signs of returning vegetation are apparent, and on one side of the Roxelane itself everything is green. But, after all, it is more the immediate foreground that gives these signs of resuscitation, for, farther beyond, and below the hanging volcanic cloud, the grays are as gray as ever, and the valley of the Rivière Blanche, choked with the immense amount of débris that has been thrown into it, is white like snow with the new ash that is periodically being swept over its course.

At Morne Rouge, which fell in the storm of August 30, not a house remained inhabited. The beautiful church under whose partially lifted roof good Père Mary had sought refuge for nearly his last hours, still stands with its foot in the ash. My attendant climbed into the belfry and tolled the bells that hung uninjured from the posts. It was the voice in the wilderness, for there were none to listen to it but ourselves. Perhaps far away on the hillsides, where specks of cottages appeared in the surrounding green, some may have recognized the beautiful resonant tones.

The exquisite woodland that, previous to August 30, bordered most of the road between here and Ajoupa-Bouillon, stood out now as ragged tree-trunks, spectres in the destroyed landscape, with naked arms and upturned roots, begging, as it were, from the new sunlight that surrounded them. Here and there the eye fell upon the returning fronds of the tree-fern and clumps of bamboo, on the melastome and broad-leaved heliconia; but they were merely visions of what had been before.

On June 13, in company with one of the officers of the French Scientific Commission, I made my fourth ascent of Pelée. The passing night promised everything. A few high clouds hovered about the blue and receding mornes that stretched off toward Carbet, but over the volcano itself there was nothing, and the great obelisk, its base fiery red with the molten lava that was being poured into it, stood out in bold relief against the green-blue western sky. We left our quarters early, so as to gain upon the clouds that viciously gather about the summit; but the clouds had preceded us, and already at the breakfast hour, by which time we had reached the former summit, everything was wrapt in cloud and mist, and little was visible beyond ourselves. We succeeded in steering a course across what had before been the basin of the Lac des Palmistes, and in a few minutes stood upon the edge of the great crater. Everything was gray within—not silent, however, for avalanches of rock were being precipitated and tumbled about in ruthless manner, and an occasional ominous roar told that the spirit of the mountain had not entirely departed. For the better part of six hours we vainly strove to penetrate the sea of cloud and fog that hung ahead of us. Each coming gust seemed to give us the chance for which we were waiting, but the rising crater-vapors kept the basin full, and even under a clear sky they allowed only "memories of a landscape" to escape. Although in no way unbearably hot, I found the crater rim uncomfortably warm and humid; it seemed to me more so than on my earlier visits. The actual temperature was only 85 degrees, however.

Shortly before two o'clock, the opportunity for which we had so impatiently waited seemed finally to have arrived. Clouds and vapors died down to one side, and the great tower, its crown hanging at a dizzy height above, began to unfold. Piece by piece was added to it—purple, brown, and gray—until at last it stood abreast of us virtually uncovered from base to summit. The spectacle was one of overwhelming grandeur, and one can hardly conceive of its terrorizing aspect. Nature's monument dedicated to the 30,000 dead who lay in the silent city below, it rises up a huge monolith, 830 feet above the newly constructed summit of the volcano, and 5,020 feet above the Caribbean surface. Nothing of this kind had ever been known to science before, and I felt—although not the first in the field to observe it—that my footsteps had been guided to an unknown world. None of the grandest scenes of nature which I had before seen—the Matterhorn, the Domes of the Yosemite, the colossus of Popocatepetl rising above the shoulders of Ixtaccihuatl, the Grand Cañon of the Colorado—seemed to impress me as this one did; and I am certain, at this distance from the field of observation, that none was more sublime. More restful scenes there certainly are.

In its geological conception, the "Tower of Pelée" means the extrusion vertically of a mass of solid lava, which in its non-fluent condition has been forced out in this way by the volcanic stress reacting upon its base. The entire tower, 300-350 feet thick where its base is implanted, and with a height twice that of the Washington Monument in Washington, is still being pushed up bodily, and at a rate that is all but incredible. During four days of my residence at Vivé the rise, as determined by the French Scientific Commission, was twenty-one feet; and the rate of ascent was far greater still in the preceding month. On the side where the great obelisk has pressed hardest on the encasing rock, the surface is smoothed, almost polished, and shows parallel lines of grooving. The other sides are slaggy, and bear evidence, especially on the side directed to Saint Pierre, of recurrent periods or episodes of eruption. These have not yet ceased.

The great volcano of Martinique is now "plugged" or "corked." How long it will remain in this condition, or how soon it may pass through another paroxysm, the future alone can determine. For the present the mountain presents alike to the tourist and the scientist an object of supreme interest. ANGELO HEILPRIN.

POEMS AND LEGENDS OF THE MIDDLE AGES.

PARIS, August 10, 1903.

M. Gaston Paris, who died a few months ago, was a prominent member of the Academy of Inscriptions and Belles-Lettres; he was also a member of the French Academy. He was preëminently a philologist, and in that capacity he belonged to nearly all the academies and universities of the world. His father, M. Paulin Paris, was a very distinguished man of letters, and the edition which he published (among other books) of the Memoirs of Tallemant des Réaux, has notes which rival the text itself in importance. It would require pages to give the titles of all the memoirs and articles published at different times and in a quantity of reviews and papers by M. Gaston Paris. He became a sort of centre for the serious devotees of literature; his last publication was a quarto volume entitled 'Poems and Legends of the Middle Ages'—the 'Chanson de Roland,' the 'Nibelungen,' 'Huon de Bordeaux,' 'Aucassin et Nicolette,' 'Tristan et Iseult,' 'Saint Josaphat,' 'Les Sept Infants de Lara.' The respective articles all have in common the study of the French poetry of the Middle Ages. "They have another bond," writes M. Gaston Paris, "in so far as they all consider French poetry in its relation to the poetry of other peoples and other times, and are essentially studies in com-

parative literature." In 'Huon de Bordeaux,' the author has drawn a parallel between French and German epic poetry; in another essay, he has proved the Germanic origin of Oberon, the king of fairyland; he has pointed out the Oriental origin of 'Aucassin et Nicolette,' which, as we know it, is so French in form and in spirit; he attributes a Celtic origin to the story of 'Tristan et Iseult,' which took new shape in England, France, and Germany successively, and has now been popularized by the magnificent music of Richard Wagner. He has shown the identity of Buddha with a saint very dear to the Middle Ages, Saint Jehoshaphat; he has likewise shown the French origin of the very Castilian legend, the 'Infants of Lara,' which in our time took on the stamp of French Romanticism under the pen of Victor Hugo.

The 'Chanson de Roland' is the finest and most truly national of our epic poems. It was altered and underwent a variety of fates when it emigrated, so to speak, to other countries, Spain, Italy, Germany. According to M. Gaston Paris, it holds the first rank among the numerous "chansons de geste" of the Middle Ages.

"It is the soul of feudal France as it existed in the eleventh century, which vivifies and inspires it. Every Christian knight might believe that he was himself the composer of those energetic verses in which he found all his own sentiments, ideas, life; and it is easy to understand that the Norman warriors at the battle of Hastings, at a moment so decisive for their chief and for themselves, felt their hearts full of the rude verses which sung the exploits of France, ready as they were themselves to conquer or to die, and had them on their lips."

The hero is the feudal baron. He belongs to a caste; he appears as a member of a peculiar social organization; he has no duties except to his lord, to the Church, to his companions in arms; he knows nothing of philanthropy. Warlike and feudal sentiments are the moving spirit of his life, and he conceives of religion only in its external and ceremonial aspects.

M. Gaston Paris considers the 'Nibelungen' inferior to the French national poem. "Like the Iliad," he says, "the 'Chanson de Roland' celebrates the great struggle of Europe against Asia; like the Iliad, it fosters and exalts the national sentiment." This character is wanting in the 'Nibelungen,' which is not national. Pagan in its primitive conception, it became Christian in the end, but religious sentiment has no place in it. The only really Germanic trait to be found in it is the absolute fidelity of the vassal to his lord. On the other hand, the German poem is more human; just because it is not national, it expresses more universal sentiments; women have a larger part in it; love, friendship, paternal affection, pacific scenes and feasts furnish more elements to the poem.

The existence of the French heroic poems of the Middle Ages was recognized only at the beginning of the nineteenth century. The eighteenth century was pretty ignorant of them, and we may say safely that if it had known them better, it would have treated them with contempt. I need give no other proof of this assertion than the success which Voltaire obtained when he ridiculed in his 'Pucelle' the heroic Joan of Arc, whom our age deservedly worships. It was only in 1829 that the first fragments of our poems of the Middle Ages were published. To do justice to the bibliophiles, who are often the initiators of important researches and studies, we owe to them the preservation and sometimes the discovery of many *chansons de geste* and poems. M. Gaston Paris enters into many details concerning the poem of 'Huon de Bordeaux,' one of the first published from the old manuscripts. Five thousand ten-syllable verses make us acquainted with the rash and impetuous but loyal, brave, and faithful Huon de Bordeaux, with Esclarmonde, who is very ardent and passionate as long as she is among the Saracens, but becomes pure and tender when converted to Christianity with Auberon, a type of many virtues, high-minded, just, indulgent. M. Gaston Paris studies the origin and history of this type of Auberon. A German poem, 'Ortnit,' of the thirteenth century, has often been compared to 'Huon de Bordeaux.' In it the king of dwarfs, Elberich or Alberich, plays a part somewhat similar to that of Auberon in 'Huon de Bordeaux.' The name Auberon (which was primitively Alberon) is but a variant of Alberich. The poem of 'Ortnit' belongs to a Germanic cycle, part of which was imitated from the French, and belongs to a series of stories from which it is inseparable ('Wolfdietrich,' 'Hugdietrich,' etc.). "In general," says M. Gaston Paris, "in cases of a well-established imitation, there are a hundred chances to one that the German has imitated the French. . . . The imitation of a German poem by a Frenchman would be almost unique." He concludes that 'Huon de Bordeaux' and 'Ortnit,' Elberich and Auberon, have a common origin. Both were inspired by a living tradition, by a common legend—very old, probably, since the two French and German poetical cycles have hardly any point of contact.

Many dramas have been inspired by certain episodes in 'Huon de Bordeaux.' In 1593 there was represented in London a piece which was probably made from a translation of the French prose version which had rapidly become popular. Everybody knows the part which Oberon plays in "A Midsummer Night's Dream," but the character which Shakspere gives to the king of fairyland is quite foreign to the primitive character of Auberon; M. Gaston Paris thinks that Shakspere derived his inspiration from Spenser, though the latter only names Oberon, and that Titania is a creation of Spenser's.

The chapter on "Tristan et Iseult" is one of the best in the book. The legend is well known. Its origin is purely Celtic. Nothing is more obscure than the history of the insular Celts after the departure of the Roman legions and the German invasion of Great Britain. Nothing remains, historically speaking, of the long and perpetual struggle between the Britons, the Celts, the Saxons, the Scandinavians. But a great mark was left by this confused story on poetry. Tristan became known to all Europe along with Arthur.

"There is," says M. Gaston Paris, "no more astonishing phenomenon in the literary history of the world than this poetical conquest of Romanized and Germanic Europe by a little obscure and despised people, forced to cross the sea or to take refuge in a corner of its ancient domain, and yet imposing on its conquerors, or on nations to which its very name was unknown, its ideal, its heroes, the music which expressed its soul, and the dreams which had cheered its imagination and consoled its sorrow. This Celtic poetry not only charmed the Middle Ages; modern poetry is still penetrated by its spirit, and owes to it two of its essential elements—the spirit of adventure and love—that is to say, the two forms of supreme individuality and the absolute possession of another being."

An excessive part may at one time have been allowed the Celtic element in the creation of the modern intellectual and moral ideal; there has been a reaction, and great efforts have been made to reduce this influence. Some German critics went so far as to deny the Celtic origin of the legend of Tristan, and discovered for it a continental origin. M. Gaston Paris, though he is a Frenchman, does not accept this view; the names of the legend, the scenery, the geography seem to him conclusive. In the great drama of Tristan the sea plays its part, is always in view. It is at sea, between Ireland and Cornwall, that Isolde and Tristan drink the fatal beverage which is the cause of their passion and their death. "Who does not feel that these images are born in the soul of a maritime nation, whose tribes are disseminated on the shores of Cambria, of Cornwall, of Armorica, and to which the sea was a highroad constantly crossed? How can we suppose that such stories were invented by the French *conteurs* of the twelfth century, who did not know, even by name, before their introduction to the Breton poetry, the Gallic or Armorican shores of the Oceanic coast?" The background of Tristan and Isolde is not the Roman and Christian civilization of the twelfth century; it is a sort of strange barbarism. The men lead an almost savage life, in forests; the kings live in huts; the souls of the heroes are strangely impulsive. Their conception of love is peculiar—it is a love stronger than honor, stronger than blood, stronger than death; the lovers are tied to each other by a chain which nothing can break. Love has a fatal character which gives them superhuman joys and superhuman sufferings. The story of Tristan and Isolde goes back to the tenth century, at a time when the vikings were kings at Dublin, and when there were constant relations between Ireland, Cornwall, and Brittany.

Correspondence.

NOT MOTLEY, BUT JOHN M. FORBES.

To the Editor of The Nation:

Sir: In an article entitled "Taine and his Statue," in the *Nation* of August 13, I find the following:

"Posthumous recognition of great men ordinarily presents few difficulties. For even a prophet whom they do not like, men are usually willing to build a tomb when they are once assured that he is 'thoroughly dead,' as Motley horrified the Londoners by saying that he hoped Stonewall Jackson was."

I apprehend the writer of the article referred to is mistaken in attributing the above expression to J. L. Motley. At the time of Jackson's death (May, 1863), Mr. Motley was not in London, but in Vienna. The reference is, I take it, to a letter of the late John M. Forbes, written from London at that time. Mr. Forbes was in England, on a secret mission intrusted to

him by the Navy Department. The incident, told in his own words, is given by his daughter, Mrs. Hughes, in her 'Letters and Recollections of John Murray Forbes' (vol. 2, pp. 17-18). It was at a dinner party at Russell Scott's. The Union defeat at Chancellorsville, the news of which had just been received in England, of course largely absorbed attention, leading to "many chilly remarks as to the folly of protracting the useless struggle to save the Union." Mr. Forbes then goes on:

"In one of the pauses which all dinner parties experience, our host appealed to me for information as to the truth of the sad, heartrending rumor that the hero, Stonewall Jackson, had been killed by his own soldiers on the evening of the rebel attack, and at the most critical period of the whole battle. With a hesitating voice, under the boiling feelings which had been aroused by the sentimental stuff which had been uttered, I replied; 'I don't know or care a brass farthing whether Jackson was killed by his own men or ours, so long as he is thoroughly killed, and stands no longer in the way of that success upon which the fate of everybody and everything I care for depends!' Had a naked Indian in war paint, with tomahawk and scalping-knife, appeared at the dinner table, the expression of horror and dismay at my barbarous utterance could hardly have been greater; but, anyhow, we heard no more that evening about the wisdom of concession to the 'erring sisters' and their chivalrous heroes and lamented leaders."

C. F. A.

Boston, August 21, 1903.

Notes.

The new edition of the Letters of Horace Walpole, arranged and annotated and analytically indexed by Mrs. Paget Toynbee—illustrated, moreover, with numerous portraits and facsimiles—will begin to make its appearance in November with the first four of sixteen volumes (Oxford: Clarendon Press; New York: H. Frowde). The accessions exceed 400 letters (100 hitherto unpublished), and there will be not a few rectifications of the text of those already printed. There will be three editions, one limited to 260 copies. After an interval (that is, not before 1906, for two years will be occupied in publication) the Letters of Madame du Deffand to Walpole will follow, under the same auspices. They have never been printed.

'London in the Time of the Stuarts,' by the late Walter Besant, is among the autumn announcements of Macmillan Co.

Harper & Brothers will publish 'Letters Home,' by William D. Howells; 'The Ambassadors,' by Henry James; 'The Heart of Hyacinth,' by Onoto Watanna; Maeterlinck's play, "Monna Vanna"; and the third volume of Poultney Bigelow's 'German Struggle for Liberty.'

A collection of sea-folk tales, 'The Strife of the Sea,' by T. Jenkins Hains, is in the press of the Baker & Taylor Company.

In preparation of a third edition of Baedeker's Guide to the United States, the editor, Mr. James F. Muirhead, is revisiting this country, and would be grateful for corrections or suggestions from users of former editions. He may be addressed in care of Messrs. Scribner.

Thomas E. Watson's 'Life and Times of Thomas Jefferson' is promised by D. Appleton & Co. for October 1.

Two daughters of the late Dr. Samuel G. Howe (Miss Maude Howe and Mrs. Florence Howe Hall) are to retell the story of Laura Bridgman in a volume bearing the imprint of Little, Brown & Co.

S. H. Wolfe has prepared, and the Insurance Press of this city will market, a work of 800 pages entitled 'Investment Directory: Insurance Companies, 1903,' being a description and classification of bonds and stocks held on January 1, 1903, by insurance companies transacting business in the United States.

The late Lord Acton's letters to Miss Mary Gladstone (Mrs. Drew) are to be brought out by George Allen in London and simultaneously in this country. The correspondence began in the seventies.

The Indian Government has decided to publish annually through the Royal Asiatic Society four volumes with historical documents pertaining to India. As reported by the *Athenæum*, the first two volumes will deal with the period antedating the advent of the English, and the next two with the British period. Rhys-Davids has charge of the former series. The first volume will treat of the geography of India with special reference to the data furnished by the Vedas.

Schwetschke & Son, Berlin, announce the publication of a new *Archiv für Reformationsgeschichte*, edited by Walter Friedensburg, and aiming chiefly to publish fresh documents on the Reformation period, especially data from sources not readily accessible. The editor was for many years connected with the Prussian Historical Institute in Rome, and has made a specialty of this literature.

The appearance of Julia Cartwright's 'Isabella d'Este' makes it opportune to revive the same writer's 'Beatrice d'Este,' which appeared in 1899 and was duly reviewed in these columns (London: Dent; New York: E. P. Dutton & Co.).

The Club for Colonial Reprints of Providence, R. I., has issued its first publication, viz., 'The Fourth Paper presented by Major Butler, with other papers edited and published by Roger Williams in London, 1652.' Only two copies of the original edition are known to be in existence, one in the John Carter Brown Library; one in the British Museum. The tract first became known to biographers of Williams in 1874, when J. Hammond Trumbull found a copy in a volume of seventeenth-century pamphlets which he purchased. This copy is the one now in the John Carter Brown Library. The present reprint is the only one that has ever been made, and is an exact reproduction of the original. It completes the reprints of the known tracts of Roger Williams. One hundred copies only are printed, on Van Gelder paper, with wide margins; well and attractively bound. Not the least interesting part of the publication are the introduction (pp. xxiii), and the notes (pp. 27-49), prepared by Mr. Clarence Saunders Brigham, the Librarian of the Rhode Island Historical Society. The Fourth Paper played a part in the effort to solve the problem how to secure religious liberty without undermining the power of the State. The introduction and notes call attention to the close relation existing between Puritans on both sides of the Atlantic in this effort.

The sixth volume of Mr. A. B. Hulbert's 'Historic Highways' (Cleveland: A. H. Clark Co.) is entitled 'Boone's Wilderness Road.' Cumberland Gap, where now three States join, was Boone's selection for a crossing of the Alleghanies when, in 1775, he cut out an ancient Indian trail for the pioneers of Kentucky. Of this highway, so important in the settlement of the country and in the history of the West and of the nation, James Lane Allen has said: "It is impossible to come upon this road without pausing, or to write of it without a tribute." Mr. Hulbert's monograph touches upon the influence of topography in history, with special reference to the successive tides that have flowed through Cumberland Gap; and some interesting material relating to the early settlement of Kentucky is reproduced, including Filson's Map, 1784. No other map is given. Like its predecessors of the series, this volume is a welcome contribution to the history of exploration and settlement, and like them it shows haste and negligence in preparation. The variety of spellings of an important geographical name almost calls for Federal interference. The river which in New York is officially "Allegany," becomes, by crossing the line into Pennsylvania, "Allegheny," while in the writings of Roosevelt and others the mountains are the "Alleghanies." Mr. Hulbert, however, prefers to call them the "Alleghenies," and the spellings found for both river and mountains in the authors whom he quotes are as numerous as those of the name of Shakspere.

'Rabbits, Cats, and Cavies,' by the well-known English fancier, Mr. C. H. Lane (E. P. Dutton & Co.), is a comprehensive manual for the breeder and exhibitor of all recognized varieties of the pet stock animals in question. Directions for rearing and mating, and details of feeding and housing, are fully and clearly set forth. The author has been a successful exhibitor, and illustrates the book with pictures of his winners. Readers who have any trace of the fancier in their nature will enjoy comparing these pictures with the standards of excellence given in the text. The subject of pedigrees and registration is not taken up—an omission that seems unfortunate in this day of careful breeding. One who is not familiar with the different kinds of rabbits, cats, and guinea pigs will be surprised to learn how many breeds there are and how much they differ from one another. Under the heading of rabbits, the food value of each variety is discussed; the Belgian hare receiving, of course, considerable attention. The book is concluded with a series of interesting anecdotes about pet animals.

Mr. John Whitelaw, jr.'s 'Surveying, as Practised by Civil Engineers and Surveyors' (D. Van Nostrand Co.) is a British manual. Our surveyors are accustomed to deem the British hopelessly behind the times; and there is some foundation for this judgment. This book, for example, says that the most precise method of determining the latitude *is* (not merely might be expected to be) by observations in the prime vertical, and never mentions the zenith-telescope. Yet the great difference in the conditions of the two countries accounts for some differences of practice. Thus, a plane-table (which, until of late years, was hardly known in England) loses much of its convenience where land is so precious that one has to work on such a scale that different points on the

plane-table are represented by sensibly different points on the map; and in a country where one is often surrounded by neighboring stone walls and hedges higher than the alidade telescope, the plane-table is hardly a practical instrument. This work has a chapter on "Surveys Abroad"; and we are all abroad in this country. We cannot say that the book will be of great value to young surveyors here. Older men may possibly find some hint or two in it that will prove useful.

The 'Elementary Applied Mechanics' of T. Alexander and A. W. Thomson (Macmillan) has barely escaped setting itself down as "an elementary treatise," which, in technological matters, is fast becoming the badge of whatever is ill-digested and heterogeneous. In the present case the appellation may be assumed to mean that the subject is taken up at the very beginning of it; that the calculus of variations and other equally abstruse mathematics are avoided, and that examples are given in the English style. It is confined to the statics of earthworks, linkwork structures, and blockwork. In no other sense is it distinctively elementary, but is a work of the highest value to the practical engineer, introducing solid improvements in the modes of solution of many problems. The authors are old scholars of Rankine, and the volume has a portrait of Rankine as its frontispiece; but why is it that Rankine's really great genius is not appreciated in Scotland? Is it that he was one of the authors of the mechanical theory of heat, so that to praise him unreservedly might sound like depreciation of Kelvin?

'Electricity as Applied to Mining,' by Arnold Lupton, G. D. Aspinall Parr, and Herbert Perkin (D. Van Nostrand Co.), is a work which a civil and mechanical engineer, an electrical engineer, and a mining engineer have put their heads together to produce, and has the appearance, upon such examination as we have been able to make of it, of inaugurating in a satisfactory manner a subject which no work in our language has hitherto treated; the very practice of lighting and working mines by electricity being itself one of the novelties of our generation.

The unparalleled growth of the manufactures of the United States from two hundred million dollars in 1810 to thirteen thousand millions in 1900 is traced, in the *National Geographic Magazine* for August, by Mr. O. P. Austin, Chief of the Bureau of Statistics. After showing the progress in each of the last five decades of the total value of the manufacturing interests, their relation to agriculture, distribution, etc., he treats of special branches such as iron and steel, coal, copper, and cotton. A comparison is instituted in most of these with France, Germany, and the United Kingdom, showing that in some instances the growth of this country has been equal to that of all combined. In railways, indeed, we exceed all Europe by 12 per cent. In 1850 Europe had fourteen thousand, this country nine thousand, miles of railway. In 1902 there were 179,000 miles in Europe and 200,000 in the United States. Among a great number of suggestive statements, one has a peculiar interest: "We are accustomed to think of the New England and Middle States as the chief seat of the manufacturing industries, and it is rather surprising to know that the centre of the manufacturing industries has steadily moved westward until it is now located in the State of Ohio. It is equally surprising to know that Ohio ranks first of all the States of the Union in the manufacture of carriages and wagons and of clay products, and second in agricultural implements and in iron and steel manufactures. Illinois holds first rank in the manufacture of agricultural implements, cars, bicycles, and distilled liquors, and second in men's clothing, furniture, musical instruments, soap, and candles. Wisconsin ranks first in lumber and timber production, Minnesota first in flour manufacturing, Missouri first in the manufacture of tobacco, Texas first in the manufacture of cottonseed-oil cake, Colorado first in lead, and California first in explosives, wines, and preserved fruits. The various manufacturing interests have extended far into the interior of the country, and in some cases across the entire continent." The whole subject is graphically illustrated by means of twenty-four diagrams.

Polar research is the principal feature of the *Geographical Journal* for July. Sir C. Markham summarizes the first year's work of the National Antarctic expedition, to which is appended the report of its commander, Capt. R. F. Scott. The exploration of the Parry archipelago is described by Capt. Otto Sverdrup, the head of the second Norwegian polar expedition in the *Fram*, with numerous illustrations and a sketch of the geological results. It is not too much to say that by this work, carried on for four and a quarter years, "the whole problem of Arctic geography has now been solved." Unlike the region about the south pole, an abundance of animal life, "especially musk oxen and smaller game, such as hares and ptarmigan, as well as foxes and wolves," was found in the newly discovered lands. But Capt. Sverdrup does not make mention of meeting any human beings, though "almost everywhere we discovered the remains of Eskimo habitations, winter houses built of stone and whalebone, as well as traces of tents, meat cellars, and fox-traps. These occurred upon almost every headland along the south and west coasts, and we also came across indications of human beings having visited the inner parts of the fjords." At one place, besides the usual Eskimo remains, there were two round towers built of stone.

The continued progress of Egypt under British rule is shown by the report upon its commerce, in the Consular Reports for August, by the late Consul-General, John G. Long. From the customs returns for the first quarter of the present year it appears that there has been an increase over the corresponding period of 1902 of five and a half million dollars, nearly two-thirds being in the exports. In these, cotton still holds the first rank, but next in importance is eggs, of which more than seventy-two millions were exported, nearly all to England. The trade with the United States, though still small, is increasing, the imports from this country having more than doubled, and the exports being nearly a third larger.

Attention may be called to the supplementary list of books from Township [School] Libraries, just issued at Madison, Wis., by the State Superintendent of Public Instruction. It is accompanied by a price list.

The genealogical passion in Massachusetts secured from the last Legislature a Vital Records Act, under which, *e. g.*, in Essex County the Essex Institute is enabled to print the births, marriages, and deaths in the cities and towns of that county from the earliest period to the middle of the nineteenth century. The Institute will go beyond the town clerk's record, supplementing it from church books, family Bibles, and other private records, gravestones, etc. Three copyists are already at work on Marblehead and Manchester records.

The high-water mark in the attendance of women at the German universities is evidently of the past. The marked decrease that appeared in the report of the winter term of 1902-1903, when the total was 1,271 in the twenty-two German universities, has been followed by another step backward, the enrolment during the present summer term being only 850. The chief cause for this retrogression is the fact that the Prussian authorities have passed stringent enactments making it anything but an easy matter for foreign women to enter a university of the kingdom. This was done chiefly because the testimonials presented by these candidates, notably the graduates of Russian women's gymnasia, proved very unsatisfactory, and both the universities and the polytechnic schools were compelled to keep off an unwelcome contingent. The decrease in the women's attendance has accordingly been most marked in Prussia, where the female enrolment is only 529, as compared with more than 900 last semester. Kiel is the only Prussian university with an increase of women, viz., 14 to 17, while Greifswald now has not one. Quite naturally there has been an increase in the two Baden universities, as it is only there that women are admitted to matriculation and examinations. The contingent at Heidelberg has advanced from 42 to 92, and at Freiburg from 14 to 22. The singular phenomenon that, notwithstanding the fact that at these two institutions alone women enjoy equal advantages with the men, they do not flock there, is explainable by the very small percentage of women who purpose completing a course and taking a degree; what they want is to enjoy the instruction of the best professors, and these are usually found at the Prussian institutions.

—'Ten Thousand Words Often Mispronounced' is the title of a useful little "handbook of difficulties in English pronunciation," by William Henry P. Phyfe (Putnams). It is a revised and enlarged edition of an earlier work by the same author called 'Seven Thousand Words Often Mispronounced.' This is alarming, for many people lack a vocabulary of ten or even seven thousand words; and while it is creditable to the author's enterprise to have added three thousand to his list, the first impression upon the mind is, that the reader mispronounces most of the words which he uses. A further examination will, however, restore a little of his self-confidence, for he will find himself occasionally compelled to doubt the infallibility of his guide. For instance, Walker is quoted as saying that *de'corous* is as bad as would be *ca'norous* or *so'norous;* but in the same breath

the author gives it as allowable. This is at least puzzling; it would have been better to omit the citation from Walker, or to have omitted *de'corous*. But this is perhaps an oversight. In most cases the author is clear and does not err on the side of liberality. We notice some omissions. For instance, if Tuesday is not to be pronounced *Toosday*, nor duke *dook*, surely we should be warned against *constitootion* and *institootion* and *restitootion*, especially as among the three thousand additional words *institoot* is placed under the ban. Some of the words given are foreign. Here we note with pleasure that the author has discovered a mispronunciation or two that we should have put down as almost inconceivable if we had not ourselves heard it. *Bona fide* is so commonly used as to be almost English; we can support Mr. Phyfe as authority for the statement that there are those who actually make it so by treating *fide* as an English word of one syllable.

—'Beginnings of Rhetoric and Composition,' by Adams Sherman Hill (American Book Company), is designed chiefly for "pupils in secondary schools who are learning to express themselves with the pen." It is full of practical exercises, and, though a handbook for teachers, is at the same time an interesting and original treatise. It is divided into three parts: "Correct and Incorrect Forms of Expression," "Essentials of Composition," and "Qualities of Expression," and introduced by a chapter on "Good English Defined," in which the author attacks a difficulty that never has been and possibly never will be overcome to everybody's satisfaction. Good English is admittedly what we desire to use; but what is "good English"? The test, according to Mr. Hill, is *present, reputable*, and *national* use. But unfortunately in the case of English there are two equal, independent, and sovereign nations concerned, and hence we have a divided authority, and it is often impossible to say more than that you must use the locally sanctioned expressions. In other words, there are often two national usages, and the American who would speak good English in America must speak good American English and vice versa. Thus, an American who should habitually speak of *coals, maize, stopping* (teeth), *tinned* (food), *reel of cotton* (for spool of thread), *lift* (for elevator), etc., would be suspected of affectation. But after all, there are the *apices* of language; the real tests of good English lie in grammar and composition, not in isolated words; and, as to grammar and composition, as any one can see by looking through Mr. Hill's pages, there is no substantial difference between good English and good American usage.

—Under the title of 'More Money for the Public Schools' President Eliot republishes three addresses to teachers delivered in 1902 (Doubleday, Page & Co.). They make a small volume of less than 200 pages, but cover a wide field. The first address offers facts showing the inadequate pecuniary support given to the public-school system at present, and appeals to the public for more "because of the failures and shortcomings in American education." This is the least satisfactory of the three, because the connection between the amount of money expended on education and the "shortcomings" on which Mr. Eliot dwells is to most minds not very clear. The "shortcomings" are admitted vices of American society, drunkenness, gambling, a blackguard or "yellow" press, industrial disturbance, violence and oppression, laxity of the marriage tie, bad city government, bad police, etc. Mr. Eliot is an avowed optimist, and consequently the picture he draws here of shortcomings is all the more striking; but the doubt which suggests itself to the mind of the reader is how far a larger expenditure of money on the public schools will correct these evils. Mr. Eliot's theory seems to be that a perfect school system (for we must suppose that the chief end of the money is to perfect it) would result in turning out perfect citizens, and perfect citizens would, *ex vi termini*, neither abuse the right of divorce, nor beat and maim their fellows to make them go on strike, nor burn negroes at the stake, nor defy the law in any way. But in fact the development of such "shortcomings" has gone on *pari passu* with the development and endowment of our educational system. So far as the evils complained of come from a lax administration of the law, they are properly administrative and political, and it is a mistake, in our judgment, to cultivate the idea that larger expenditure of money on the schools will have any appreciable effect on them, for it diverts public attention from the only possible effective remedies of an immediate sort.

—The second essay, asking for more money for the public schools "because of the gains made in 'American education,'" is more successful. Here Mr. Eliot is certainly at home, and makes, as he also does in the third address, on "The Needs of American Public Schools," many important and striking points—*e. g.*, that a pension system is a crying need of our school system. Pensions after a certain term of service would cost something, but not so much, directly and indirectly, as the present system, or want of system, which involves the "not uncommon method of keeping enfeebled or aged teachers and even superannuated or partially disabled teachers, at work on their full salaries." Another reason for more money is the fact that it is absolutely required in order that the individual pupil shall receive the attention to which he is entitled. The number of pupils placed under the care of a single teacher in the different school systems of the United States varies from forty to sixty. "The higher number is monstrous, and the lower far too large." Twenty-five, Mr. Eliot thinks, ought to be the limit, and no one will think this overliberal. Another expensive but necessary improvement is "the introduction of selection among studies as early as ten years of age." Unless this is done, and done soon, the public schools will "cease to be resorted to by the children of well-to-do Americans." The private and endowed schools offer a choice of foreign languages as early as ten years of age and even earlier. The volume as a whole is an extremely interesting and valuable contribution to the literature of the subject.

—The work of following up Gibbon which has been done in general by Professor Bury, is carried forward in the case of a particular incident by Mr. Edwin Pears 'The Destruction of the Greek Empire and the Story of the Capture of Constantinople by the Turks' (Longmans) has been written in the light of important materials which were unknown to Gibbon, and also with a desire of readjusting the point of view. Gibbon, in his account of the last struggle between Constantinople and its Moslem enemies, employed all the sources then known, but he had the misfortune to draw his information from authors who were bitterly hostile to the Byzantines. In 1439 the Greek representatives at the Council of Florence had made virtual submission to Rome, but their action was repudiated by the Greek Church at large. Thus the last fourteen years of the Eastern Empire witnessed a fierce feud between Greeks and Latins, which left its mark upon the historical literature of the age. Gibbon found in the hostile writings of the Latins enough to confirm his prejudice against the theological hair-splitting of the East. It is the function of Mr. Pears to give the debates over the Double Procession their proper place as a motive force. "When writing of this period," he says, "Gibbon did not realize that the religious question was nearly always a political one, and that union with Rome meant subjection to Rome. But unless it be realized how completely the citizens of Constantinople and the other great cities of the Empire were engrossed with semi-religious and semi-political questions, no true conception of the life of the Empire can be formed; these questions were of interest not merely to churchmen, but to all." Chief among the new documents which Mr. Pears employs are the diary of the Venetian Nicolò Barbaro, and the life of Mahomet by the Greek Critobulus. Of these the latter is perhaps the more interesting, although Barbaro's narrative of the siege bears marks of great honesty. Critobulus was a Greek who took service under Mahomet after the Turkish victory, and admitted freely the best qualities of the conquerors without losing his natural sympathy for his own people. While Barbaro and Critobulus are the most important of the new authorities, additional information is supplied by a large number of minor writings, and Mr. Pears has ample warrant for his volume. Like the works of Mordtmann and Millingen, it represents an original and thorough examination of all the contemporary accounts that are known to exist, and it is the first book in English which covers the ground with great fulness of detail. Mr. Pears has already become a recognized authority on the Fourth Crusade, and his residence at Constantinople supplies him with the local inspiration which is so valuable for an historical essay of this kind. Experts in historical terminology may be interested to know that Mr. Pears differs from Freeman and Professor Bury regarding the use of the term Eastern Roman Empire—at least in its application to the last days of the Byzantine régime. The state of which Constantinople was the capital had used a coinage with Greek inscriptions since the days of Heraclius, was the centre of a Greek church, and was known to the West as the Greek Empire. Hence Mr. Pears adopts this phrase in the title of his excellent monograph.

—From Lemcke & Buechner we receive the first two volumes of the new (sixth) edition of 'Meyer's Grosses Konversations-Lexikon' (Leipzig: Bibliographisches Institut). There is an irresistible tendency to enlargement in the periodic rewriting of

this standard work: the stock articles must be continued to date; new themes (like Appendicitis) claim a place; competition causes the illustrations to be multiplied. Under America, for example, there now appears a chronological table unknown to the fourth edition (the nearest to hand), showing the principal events in continental, interstate, and foreign relations, beginning with our Senate's assent to the House Chinese Exclusion Bill in July 3, 1884, and ending with the realization of the Cuban Republic last year; a handy conspectus. In general, the United States receives less attention than is desirable. The brief article on John Quincy Adams would have been scarcely made longer by mentioning his authorship of the "Monroe" Doctrine, and of that view of the war power over slavery which had so much weight with Lincoln in determining the emancipation proclamation. Nor would one suspect from the statement that the ex-President held an "independent" attitude in the House, that this was the most brilliant part of his career, and potent in the development of Northern resistance to slaveholding aggrandizement and aggression. Under Architecture we find named two leading technical journals in this country, but neither in the text nor in the illustrations is there any exemplification of our skill or our problems in the builder's art; no American statue enters into the pictorial muster from ancient times to Begas's Wilhelm I. (the curious parallel of Saint-Gaudens's Sherman). Of the illustrations, in number, variety, and excellence, accompanying A to Bismarck, we can speak only in praise. We mention a map of exploration in Central Asia, and portraits of the chief African explorers; several maps of the Dark Continent, a fine one of Egypt and Abyssinia; many plates of fauna and flora; plans of Antwerp and modern Athens; plates ethnological for Asia, Africa, and Australia, geological for the Alps; maps of Baden, Bavaria, and Belgium.

CHARLES JAMES FOX.

Charles James Fox: A Political Study. By J. L. Le B. Hammond. London: Methuen & Co. 1903.

What are we to think of Charles James Fox? This seems an odd question at this time of day, but it is raised by Mr. Hammond and possesses a certain interest.

Our author has no doubt whatever as to the proper answer to his inquiry. Fox is, in his eye, everything that is lovable, great, good, and wise; and any man who at any time opposed him, whether it were George III. or Pitt or Burke, will be found to be in the wrong. Mr. Hammond's book is, as he truly says, "in no sense a biography"; "it is an attempt to portray the great ideas Fox stood for, to vindicate the essential consistency of his career, and to appreciate the magnanimous inspirations he gave to politics." Mr. Hammond admits himself to be inspired by Trevelyan's 'Early Life of Charles James Fox' with "a sentiment which it is perhaps not an exaggeration to describe as a personal affection for the great Whig statesman." He comes forward, therefore, as a eulogist of his hero, and, let us add, as a eulogist who, as far as one can judge, possesses no special sources of information which were not open to any one else who has written on Fox's career, and were not well known to any one interested in the political history of England during Fox's lifetime.

If we ask why it is that Mr. Hammond has a "personal affection" for Fox, the answer lies ready to hand. Mr. Hammond, like Joseph Surface, or some one of Joseph Surface's admirers, "loves a man of sentiment"; and Fox, for good and bad, was, throughout life, the statesman of sentiment. The plain truth is that, even to bring out the best side of Fox's character, it would have been well if Mr. Hammond had placed a curb on his own personal affection, and tried to make a free use of whatever critical judgment he may possess. When readers are in substance told that a statesman whose whole career was, from one point, a lamentable failure, and whose faults were at least as conspicuous as his extraordinary talents, was (subject to a few youthful errors) the best and the wisest among the politicians of his day, it is a little difficult to do justice to the gifts and to the generous impulses of a man who, with all his faults, excited far more love among his followers than do most statesmen.

Let us put aside, however, the spirit of opposition almost inevitably engendered by Mr. Hammond's undiscriminating admiration, and, taking Fox as what he really was, namely, the statesman of sentiment, try to weigh his undoubted talents and virtues against his equally undoubted faults.

Even in considering the best side of Fox's character, it will be well to set aside one or two traits on which Fox's biographers dilate *ad nauseam*, but which have hardly any real bearing upon his statesmanship. What, for instance, does it matter that he was a good classical scholar, that he had a passion for Euripides, or that, when arrested (or on the point of being arrested) for debt, he consoled himself, though he hardly can thereby have given much comfort to his creditors, by reading Herodotus? It would have been much more to the purpose to show that he felt some regret for preëminently discreditable extravagance. Charles Surface was in so far a better man than Joseph Surface in that he was not a hypocrite; but, after all, Charles Surface was a very sorry sort of hero. Then, again, Fox's amiability and his personal charm (which was compatible, by the way, with a great deal of easy-going selfishness, or at least self-indulgence), though they account for the love of his friends, ought hardly to go for much when we try to measure his statesmanship. It were desirable that, at this time of day, critics should try to dismiss from their minds Fox's scholarship, his lovableness, and his wit, and fix their attention on the strong points of his statesmanship.

His strength, which was very real, lay in three qualities—the first two of them intellectual, the last moral. He was a consummate debater—the most skilful debater, it is probable, that the English Parliament has ever produced; he had also the capacity, always combined with genius for debate, for strenuous work and for mastering the details of business. These two intellectual gifts would have been of themselves enough to make Fox eminent among the men of his day. Yet it is not on his oratorical genius nor on his capacity for mastering intricate affairs that Fox's fame really rests. Such lasting reputation as he has is due to insight given by capacity for generous emotion. The well-known Roman Catholic lawyer, Charles Butler, has, in his reminiscences, left a comparison of Pitt and Fox, the sum of which is that, in nine questions out of ten, Pitt's judgment was right where Fox's judgment was wrong, but that the tenth question on which Fox was right was of more importance than all the other nine on which Pitt was right. This estimate is unduly favorable to Fox; still it has a real significance. It means that Fox's sentiment, his love of liberty, or his hatred of injustice, led him aright in cases where the far sounder judgment of Pitt, because it was accompanied by a certain coldness of nature, was at fault. It is on the generosity of Fox's sentiment and the insight or foresight acquired thereby, that a judicious eulogist must insist. Fox, it may be said, guided by the transcendent genius of Burke, denounced the folly and wickedness of the war with the insurgent colonies. Fox, again guided by Burke, was roused to indignation by the real or supposed iniquities of Hastings. Fox saw a very little way into the nature of the French Revolution, but his love of liberty made him sympathize with the French people in their struggle for freedom, and open his eyes to the likelihood, to which abler men than himself were blind, that a coalition which threatened the restoration of the *ancien régime* and the dismemberment of France would rouse the desperate resistance of French national feeling. He felt for the grievances of Roman Catholics and Dissenters; he perceived, at any rate more clearly than did Pitt, the dangers of a union enforced upon Ireland against the wishes of a large part of the Irish people—and here, too, it is possible, though not certain, that he was guided by sympathy with what we should now call the spirit of nationality. He was the friend of civil and religious freedom at a time when the love of freedom was in many men almost extinguished by their hatred of the enormities committed in the name of liberty. Fox was the statesman of sentiment, and in many respects his sentiment was generous and therefore partook of wisdom.

Never was there a man who more certainly than Fox displayed to the world the weak side of his good qualities. With his extraordinary oratorical powers, with his personal charm, with all his capacity for feeling and expressing generous emotions, he never, unless for a few months after the fall of Lord North, commanded the confidence of Englishmen; and the people of England were right in refusing to give him their trust.

His character was marred by two fatal defects—want of seriousness and lack of sound judgment. His superficiality or want of seriousness is a trait on which it is worth while to insist, because it lies at the bottom of half if not all of his practical errors. His admirers who boast his skill in debate, should remember that this rhetorical gift was displayed quite as strongly while he was parading as an out-and-out Tory in the Government of Lord North as when he was posing as the friend of liberty and threatening to bring Lord North to the scaffold. They should remember that the youthful Charles James Fox, as the unconverted Tory, bore a very strong resemblance to Charles James Fox the con-

verted Whig. His want of seriousness comes out at every turn. Lord North, at any rate, knew that the most violent invectives of Fox meant nothing. The leader of the Opposition had been pouring forth his scathing denunciations upon one of North's colleagues. When the debate was over, "I am glad, Charles," said his Lordship, "that you did not turn upon me to-night, you were in high feather." The compliment would have seemed to many men an insult; it meant, and Fox must have known it meant, that Fox's philippics were a rhetorical exercise, and had little more reality than has the declamation of undergraduates at a debating society.

Fox's want of self-control is illustrated by his incapacity to tear himself away from the gambling tables, where he lost not only his money but his character as a serious statesman. He seems hardly to have known what character meant; he never understood that Englishmen are governed in the long run by their morality, and therefore to the end of his life never saw why the coalition with North, whom Fox had denounced as the most incapable and infamous of Ministers, shocked the just moral sentiment of the public. Mr. Hammond, though his language is a little uncertain, apparently wishes on this matter to urge some kind of plea in arrest or in mitigation of judgment. If this be his intention, his labor is thrown away. Nothing but the production of new and unknown facts can avail to affect the verdict pronounced by men so little inclined to underrate the Whig statesman as Macaulay and Lecky. Fox has been found guilty of the grossest of political blunders, and the blunder originated in a want of seriousness. Even where Fox's kindliness and generosity might have kept him right, he falls a victim to the same fault. The Prince of Wales, by his own mendacity, led Fox to tell publicly an untruth, and an untruth which calumniated Mrs. Fitz-Herbert. Fox thought it enough to cut the Prince for a year. Fox sympathized with Grattan in resistance to the union of Ireland with England, but Fox did not feel it a duty to express his opposition in Parliament; but duty was one of those elementary ideas hardly intelligible to the lovable man of sentiment.

Here, however, we touch on that singular want of judgment which was not in reality want of sense nearly so much as the lack of a certain kind of morality. Fox's whole career was curiously influenced by personal feeling. A not unfounded dislike and distrust of George III. blinded him, as it did most of the Whigs, to the King's possession of political skill or cunning, and still more to the fact that the King's strength lay in his sharing the feeling of the nation. Fox, from personal feeling, never felt the contempt which every man of insight ought to have entertained for the Prince of Wales. He was certainly prepared to snatch power by the influence of the Prince as Regent, when he had ostentatiously made it his object to resist the influence of the King. His whole view of Parliament was, in a man who to Mr. Hammond represents Liberalism, almost grotesque. He began political life by urging on the House of Commons in the conflict with Wilkes, which was a conflict in reality with the nation. In 1783 he denied the Crown's right of dissolving Parliament, and, in denouncing a "penal dissolution," denied that right of an appeal to the electors which is the very basis of our modern Constitutionalism. A Whig might drink occasionally to the sovereignty of the people, but the Whig creed, as entertained by Fox, was summed up in the sovereignty of the House of Commons. His childish notion, connected with family prejudices, that Lord Hardwicke's Marriage Act was a violation of natural rights; and his conviction that the taking of the Bastille, stained as it was with cruelty and treachery, was the greatest and best event in the world's history, are queer instances of the triumph of sentimentalism over common sense and statesmanlike insight. But Fox's utter absence of sound judgment is most seen in such a deficient feeling of decent patriotism as to lead him constantly to offend every Englishman's love of England. Referring to the defeat of the Duke of Brunswick by the French, Fox wrote: "No public event, not excepting Saratoga and Yorktown, ever gave me so much delight." These expressions may possibly be excused on the plea that an Englishman in England had a right to sympathize with one party to a civil war carried on between Englishmen in America; but in 1801 he went a step further:

> "The truth is," he writes, "I am gone something further in hate to the English Government than perhaps you and the rest of my friends are, and certainly further than can with prudence be avowed. The triumph of the French Government over the English does, in fact, afford me a degree of pleasure which it is very difficult to disguise."

On this Mr. Hammond: "It is rather hard to erect the fugitive pleasure Fox took in the mortification of that party [to which he was opposed] into a serious and solemn impeachment of his patriotism." Such a plea is futile; it admits the truth of the charge that Fox exulted in the triumph of France over England because it involved the discredit of the Tories. Partisanship had extinguished patriotism.

MACDONALD'S MUSLIM THEOLOGY.

Development of Muslim Theology, Jurisprudence, and Constitutional Theory. By Duncan B. Macdonald, Professor of Semitic Languages in Hartford Theological Seminary. Charles Scribner's Sons. 1903. Pp. xii, 386.

This is a capital essay in a difficult field. It is one of a series of popular handbooks of Semitic science ("The Semitic Series," edited by Professor Craig, of the University of Michigan), and aims to provide a brief introduction to Mohammedan law, theology, and theory of the state, not only for the student, but also for the serious reading public generally. Obviously, the task of combining the qualities of a semi-popular treatise with those of a text-book for special students is here no easy one, and Professor Macdonald deserves corresponding credit for the measure of success which he has achieved. The book is, as its author justly claims, a pioneer of its kind, as a readable compendium of this somewhat remote material; it is also the work of a thorough scholar in the field, who has delved independently in the original sources, and can speak with authority.

The subject-matter is treated in three divisions. First, a sketch of Mohammedan constitutional history is given, tracing the development of the theory of the state, in its main ramifications, from the death of Mohammed down to the present time. This occupies about sixty pages. Then follows a similar panoramic view, in outline, of the growth of Muslim law, occupying fifty pages. Lastly, the theological development is traced, and of course much more fully treated (168 pages). The disadvantages of such a disposition of the material are obvious. Since very much the same actors appear in each of the three departments, a good deal of repetition is unavoidable; while, on the other hand, it constantly happens that material which would help to an understanding of the growth of constitutional or legal theory must needs be reserved for the section treating of theology, or *vice versa*. It may be doubted, however, whether the difficulty could well have been avoided, under the circumstances. The three subjects named in the title of the book do not form a true unity, but are somewhat arbitrarily chosen from a group of closely allied themes. Given the limitation and the complication which this choice entails, and it is not easy to see what better mode of procedure could be adopted than the one here followed. The three themes could undoubtedly be fused—and perhaps with less difficulty than the author seems to imply, on page 4—in one continuous history; but the result would be a nondescript, incomplete as a history of Islam, and unsatisfactory as a view of the three separate fields contemplated in the plan of the book.

As it is, we have three admirable sketches. The first two, dealing with Constitutional Theory and Jurisprudence, are especially well adapted to their purpose, though occasionally suffering from the formal defect just mentioned. The matter is selected with good judgment and a true sense of proportion. The main lines are plainly and vigorously drawn, and the salient points of the history are grasped so firmly and set forth so lucidly that even the reader quite new to the field cannot fail to get a clear idea of the course in which these currents of Mohammedan life ran. Especially good are the account of the origin of the Fatimids, the setting forth of present-day theories of the Caliphate and the Sultanate, and the luminous brevity with which the principal legal schools are characterized. It is a great satisfaction to see now brought together in convenient form these and many similar matters which have heretofore been found only in scattered and often hardly accessible treatises. The oft-repeated contrast between Umayyads (heathen kings) and Abbasids (pious caliphs) is perhaps too sharply drawn, in so far as it implies that much more "piety" might have been expected from the former line of rulers than they actually displayed, and that the orthodox Muslim historian is really justified in mentioning them collectively with a shudder. And were Mo'awiya and Abd el-Melik ibn Merwan really more "worldly-minded," after all, than Harun er-Rashid and el-Mutawekkil?

In his sketch of the history of Islamic theology, Professor Macdonald begins with the system of doctrine—so far as it could be called a system—which the first caliphs inherited. With the sources and character of the theology of Mohammed and the Koran he does not concern himself. As in the other cases, he traces the development down to the present day; this

time, however, the mode of treatment is largely biographical, as was to be expected. It must be borne in mind that a compendium of Muslim theology is a novelty in Occidental literature. For the earlier part of the history, there is the excellent treatise by Houtsma, especially, and for the development of philosophy the very good but meagre outline by De Boer; the greater part of the field, however, is covered only by scattered monographs—many of them of great importance, to be sure. The fact that our knowledge of Mohammedan theologians and theological movements is so fragmentary and imperfect at best has tended to discourage scholars from the attempt at a complete presentation, even in outline. Sources of the first importance are still unused, or inaccessible; great gaps remain to be filled. But the result of the present attempt is its ample justification, and its author has no need to apologize. Here, again, the presentation is in the main clear, though the greater difficulties of the subject-matter are apparent, and the enforced separation of theology from philosophy, in particular, occasionally works trouble.

The leaders of Mohammedan thought, Ash'ari, Ibn Hazm, Ghazali, Ibn Tumart, Ibn Rushd, Sha'rani, and their lesser fellows, are treated discriminatingly and with eminent fairness. The picture of Ghazali stands out with especial prominence, as was to be expected from the study which Professor Macdonald had previously given to him and his works. Ibn Sina, as philosopher rather than theologian, is barely mentioned. Some account is given of the rise of the dervish fraternities; modern liberal and mystic drifts, and the Wahhabi reaction from them, are noticed; and the sketch ends with a word on the tendencies of the present day. The whole account is written in an interesting way, it should be added. The writer shows himself to be in sympathy with the native scholars, not impatient with their crudest notions, and—what is comparatively rare among Occidental commentators on Oriental writings—appreciative of their sense of humor.

In spite of such literary excellences as these, which will appeal to all classes of readers alike, the volume is not one which the general public will find it easy to read. Its author nowhere entirely forgets the non-professional reader, it is true; but the one for whom he actually writes is the special student beginning the study of Muslim institutions, and expecting to do more or less reading in the original sources. Hence the multitude of Arabic words and phrases, used sometimes without either translation or explanation (so, for example, pp. 171, 209, 234, 272, 275, 286), and very frequently in such a way as to be really useful only to the advanced student of Arabic. In some of these cases help might be had from the cross-references in the index; but the labor of such a search is too much to expect of even the interested reader. Allusions abound, moreover, which the specialist will understand, but which will certainly be lost on the tyro.

The importance of the book is considerably enhanced by an Appendix (pp. 291-357) consisting of illustrative documents and extracts which the author himself has rendered into English. These are: Shahrastani's classification of Muslim sects; two traditions from the Prophet as to the essentials of Islam; creeds of Ash'ari, Ghazali, and Nasafi; Fudali's system of theology (36 pages); and the analysis of a treatise in canon law. Professor Macdonald's translations are sometimes so literal as to be obscure or inelegant, but the reader can depend upon their accuracy. Any one who is well acquainted with Mohammedan literature of this class will know how to value the wording and phrasing of his version. Painstaking care and a wide acquaintance with the field are everywhere in evidence. The Bibliography which constitutes Appendix II. (pp. 358-367) is well chosen, and will be very useful. In the section dealing with Muslim tradition we miss a reference to the valuable article by the late Professor Salisbury, published in the Journal of the American Oriental Society (vol. vii., pp. 60-142). A full Chronological Table and a good Index (including the technical terms used) complete the book.

The system of transliteration adopted, aside from the fact that it is uncompromisingly stiff, provides real difficulties for the inexpert reader. There is nothing to give any hint as to how proper names and technical terms should be pronounced; not even the accented syllable is marked. The help of the ear is thus denied the reader. It is true that all of these words (excepting one or two which are accidentally omitted) are more exactly transliterated in an index—though even there in an unsatisfactory way; but an index does not by any means meet the need. It should be said, in justice to the author, that this defect is very likely not his fault.

The number of errata due to hasty proofreading and like causes is unusually small. Such are "Emessa [*sic*] in the Lebanon" (p. 163); the mention of the Ayyubids in the table of contents of chapter ii. (p. 34); and the second reference to al-Baghawi in the index (p. 375). On page 187, line 30, a reference to page 38 should be given, or else the name should be written uniformly. A few other minor slips will easily be corrected by the reader. To sum up: This work, unpretentious as it is, is a credit to American scholarship, and will be welcomed everywhere in the learned world as an important contribution to the literature of its class. All those, especially, who are seriously concerned with Mohammedan studies, will feel themselves deeply in its author's debt.

A Naturalist in Indian Seas; or, Four Years with the Royal Indian Marine Survey Ship *Investigator*. By A. Alcock, LL.D. London: John Murray; New York: E. P. Dutton & Co. 8vo, pp. xxiv, 328. Illustrated.

This volume relates to seas, shores, islands, and their inhabitants encountered in voyages in the Bay of Bengal and the eastern parts of the Arabian Sea, northern reaches of the Indian Ocean. It is the work of a good observer and a charming writer; its contents are full of profit and entertainment. Its facts were gathered some twelve or fourteen years ago, but the regions to which it pertains are not subject to as rapid change as some parts of the world, and so the accounts are very little behind the times. Popular interest will be greater in what concerns the isolated little island worlds, their people, customs, and governments, or in visits to shores more or less out of the way; but all of the narrative will pay for time and attention bestowed upon it, and much of it has more than temporary value in its records for future comparisons. The substance of both the scientific and the popular sections has been printed elsewhere, in places not accessible to most readers.

The centre of interest for the student is in the deep-sea research, in the revelations of collections made far below the surface. The discoveries were published so long ago that in some cases the work of subsequent expeditions has rendered modifications necessary, yet the author prefers to reprint his first reports, thereby making some openings for a critic. That there was once a continuity of sea and shore between India and Japan and the Mediterranean is most likely—it is proved by the affinities of the animals found in these various localities; but the author goes too far in asserting identity of species. Such a species as his *Bembrops platyrhynchus*, which he makes identical with the earlier *B. caudimacula* of the mid-Atlantic, differs so much that it had better be kept separate. And so with other fishes. Years ago it was pointed out that the description of *Lamprogrammus* was faulty, but the errors are again published. It is said of this fish that the scales of the lateral line are modified to produce light, that the black skin covering this line is loop-holed opposite every scale to expose a spindle-shaped cavity dug in the scale itself, etc., and that when the lamps are lighted, the fish shows a row of portholes lit up like those of a ship. Evidently this was drawn from a partly-destroyed specimen, which of course is no excuse for republishing. Unmutilated, the black skin covering the line has its armature of scales, like the skin over the body; it has no "portholes"; what Dr. Alcock calls the spindle-shaped cavity dug into the scales is only a remnant, after maceration, of a glandular body that rests upon the scale in the lateral line, and this scale was modified because of its connection with the light-producing apparatus.

Many students of the depths have been disappointed by inability to find living types representative of forms now known only by their fossils. The *Investigator* succeeded no better than other explorers in regard to persistent types. It does not seem reasonable to expect species to persist unchanged upon descent into conditions less and less favorable for the maintenance of life, no matter how changeless such conditions may be. Farther and farther from light, heat, and vegetation, forms more and more degraded are to be expected, as we find them—forms less fitted for persistence because of adverse effects on structure and propagation, and less like the fossils and less adapted for fossilization because of loss of mineral matter in tissues, the firmness of which has come to depend on pressure. Dr. Alcock discovered no primitive types, no connecting links in his collections, but from absence of Lophobranchs and Plectognaths at great depths, he decides that the bathybial fishes, as compared with marine forms near the surface, are somewhat more antiquated. We should agree better if he had said degraded—for it is likely that the feeding habits of Lophobranchs and Plectognaths have tended to keep them near the surface of the abysses.

Memories of Yale Life and Men, 1845-1899. By Timothy Dwight. Dodd, Mead & Co. 1903. Portrait illustrations.

The years covered by these memories constitute the most interesting and the most eventful period in the history of Yale. The college has become a university, and all its methods have been changed. President Dwight knew it when it was small, when everything was severely plain, when its poverty was, according to modern standards, extreme. He has seen numbers increase, comfort and even luxury succeed indigence, and learning become vastly extended and diversified. These changes he contemplates with equanimity and records impartially. He is no *laudator temporis acti;* knowing by experience how sore a hindrance the scanty resources of former years have been, he welcomes the ampler means which make the acquisition of knowledge easier and pleasanter. Yet, as to the character of the students graduated then and now, while he finds no deterioration, he does not find the modern man altogether superior. His knowledge is more varied and more extensive, but his powers are no greater. Even in the matter of physical culture, he asserts that the hard students of the days when gymnasiums and college sports were unknown were quite as healthful as the average athletes of the more recent times. There is, in his opinion, no greater error than to suppose "that students in the college years lose their health because they give themselves devotedly to scholarly work."

Many views presented here deserve consideration by those concerned with instruction, but the chief interest of the book lies in its account of the former teachers at Yale, and the manners and customs of earlier days. Old graduates will enjoy the characterization of the men they knew; the lineaments are clear, and the foibles and limitations of these half-forgotten worthies are not omitted. But the colors are dim and faint. Readers who have had no personal acquaintance with these men will be apt to think it no misfortune, and to find most of these appreciations rather dull and tiresome. Something the same is true of the descriptions of the life of the earlier period. They may be accurate, and the reflections may be judicious, but they lack life and spirit. To read the book is a little like walking through a cemetery; the monuments are so numerous as to distract the attention; most are commonplace, and none is so striking as to arouse deep feeling. The inscriptions here are more veracious than those carved in stone, and give us some idea of the manner of men there were aforetime. They will not, however, do much more than the generality of mortuary tributes to confer immortality on their subjects. Yet the book contains so much wisdom, the result of long experience and large charity, as will keep fresh the memory of the venerable author long after he shall have rejoined the men whose acts he has here commemorated.

Self-Government in Canada, and How It was Achieved: The Story of Lord Durham's Report. By F. Bradshaw, B.A., Senior Hulme Exhibitioner, Brasenose College, Oxford. London: P. S. King & Co., 1903. Pp. 414.

Mr. Bradshaw's 'Self-Government in Canada' will be found to be not a work on the general subject, but an historical account of Lord Durham's mission and its sequel. Nor does it contain anything very new in the way of facts. It is, nevertheless, a book to be read by any one who is dealing with Canadian history.

Mr. Bradshaw's estimate of Lord Durham is high. Durham's character was a striking, though not very uncommon, union of the social aristocrat with the political reformer. In Canada he went to the verge of the ridiculous in playing royalty. The reformer, however, in him, as well as the aristocrat, was genuine. His Report shows a large and liberal mind. How far it was really his own work, how far it was the work of Wakefield and Buller, seems to remain doubtful. "Wakefield thought it; Buller wrote it; Durham signed it," is, in Mr. Bradshaw's opinion, more epigrammatic than true. The literary excellence, however, seems to point to Buller. Durham certainly exceeded his legal powers in undertaking to banish traitors to Bermuda and threatening them with death if they returned. Altogether, in Canada as well as in the English Cabinet, his hot and overbearing temper was his bane. But his intentions were liberal and clement; his resettlement of Canada shines brightly in comparison with the re-settlement of the Transvaal. One part of the Report provokes a smile:

"I entertain no doubts as to the national character which must be given to Lower Canada; it must be that of the British Empire—that of the majority of the population of British America—that of the great race which must, in the lapse of no long period of time, be predominant over the whole North American Continent. Without effecting the change so rapidly or so roughly as to shock the feelings and trample on the welfare of the existing generation, it must henceforth be the first and steady purpose of the British Government to establish an English population, with English laws and language, in this province, and to trust its Government to none but a decidedly English Legislature."

It is needless to say that the French nationality of Quebec has not been absorbed into that of "the great race."

After reading the Durham Report, the history of the mission recounted by Mr. Bradshaw, and the sequel, one cannot help thinking that all this trouble might have been spared. The people about whose political settlement there was so much ado, were probably above the average in practical good sense as well as in pioneer energy; while it may safely be assumed that they best knew their own interest. Had they been simply let alone without the interference of the Colonial Office or paternal regulation of any kind, they would probably have evolved institutions suited to their need—most likely after the general model of those of England—and administered them economically and well.

State Experiments in Australia and New Zealand. By William Pember Reeves. 2 vols. E. P. Dutton & Co. 1903.

The British colonies in Australasia furnish most attractive material for the student of comparative politics. In the scientific sense, it is true, the method of experiment is not applicable to social organizations. The differences are always so numerous as to make it impracticable to isolate causes and to assign consequences to particular antecedents. But in the case of these colonies we discern one common tendency, whether it be a conscious aim or not. Nearly all the new laws are intended to accomplish what was sought in the French Revolution—the equalization of wealth. By land laws, by progressive taxes, by labor legislation, by state ownership, the attempt is constantly made to discourage the accumulation of wealth in few hands, and to favor its distribution among the people. The French laws of inheritance have not been introduced, nor has the doctrine that rent belongs to the community made much progress. But these experiments may yet be tried; and meanwhile there are experiments enough going on to absorb our attention.

These experiments are literally too numerous to mention, and we can only say that Mr. Reeves's account of them is lucid and interesting. His style is excellent, and his descriptions of the peculiar aspects and qualities of the different parts of Australia and New Zealand constitute an admirable geographical essay. While his sympathies are strongly with the party of progress, he has tried to be impartial, and he has generally succeeded. He is obviously satisfied that most of the "State experiments" are beneficial, and that they will result in better conditions of life. It is well to remember, however, that these colonies have been developed largely with borrowed capital, and that they are near the end of their credit. Their aggregate debt is very large, and their birth-rate is surprisingly small. Within thirty-five years it has declined from 42 in the thousand to 27; and a death rate of 11.36 per thousand cannot be permanent. Immigration, moreover, has greatly fallen off. In the decade ending with 1900 the excess of arrivals in Australia over departures was but 26,515. And, finally, the tendency of population to concentrate in cities is very marked. These facts indicate that future development will be brought about mainly by the present inhabitants and their descendants, using their own resources. What the issue will be we do not feel able to predict, but the process will be intently watched by the world, and every one who desires to understand it will find Mr. Reeves's book serviceable.

BOOKS OF THE WEEK.

Henry Holt & Company's

Recent and Forthcoming Books in History, Finance, English and Foreign Languages.

Fournier's Napoleon I. Translation edited by Prof. E. G. BOURNE, of Yale. With full bibliography. About 750 pp., 12mo. (Oct.)

Lord's Regency of Marie de Medicis, with illustrations from old portraits. 180 pp. 12mo. (In press.)

Scott's Money and Banking. By Prof. W. A. SCOTT of the University of Wisconsin. x+381 pp. 8vo. $2.00 *net.*

Prof. Allyn A. Young of Adelbert College:—"There has been great need of a book on these subjects adapted to the use of college classes. Prof. Scott's work seems to supply the want admirably.

Adams's Science of Finance. Cheaper Edition, 573 pp. 8vo. $2.75 *net.*

Alden's English Verse. Specimens illustrating its principles and history, chosen and edited by Prof. RAYMOND M. ALDEN, of Stanford University. xiv+459 pp. 16mo. $1.25 *net.*

Prof. Henry Van Dyke, of Princeton: "It seems to me an excellent book, much needed and thoroughly well-made."

Shakespeare's Merchant of Venice. Edited by Prof. THOMAS MARC PARROTT of Princeton. xli+220 pp. 16mo. 50c. *net.*

Yale Studies in English. Paper 8vo. (*List on application.*) **KING ALFRED'S OLD ENGLISH VERSION OF ST. AUGUSTINE'S SOLILOQUIES.** (HARGROVE.) lvii+120 pp. $1.00 *net.* **PLUTARCH AND BASIL THE GREAT ON THE STUDY AND USE OF POETRY.** (PADELFORD.) 136 pp. 75 cents *net.*

Vos's Essentials of German. By Prof. B. J. Vos, of Johns Hopkins University. 222 pp. 12mo. 80c. *net.*

The book presents in a comparatively small compass an outline of the main facts of German grammar. Copious exercises have been provided, the vocabulary being limited as far as practicable to the more common words of the language.

Bierwirth's Beginning German. 30 Short Lessons with an Abstract of Grammar. By Dr. H. C. BIERWIRTH of Harvard, author of "The Elements of German." 214 pp. 8vo. 80 cents *net.*

The exercises are based on 800 of the commonest words.

TEXTS.—FULDA'S DER TALISMAN. Edited by Dr. E. MEYER. Western Reserve Univ. xli+171 pp. 35 cents *net.*
KLEIST: MICHAEL KOHLHAAS. Edited by Dr. WM. KURRELMEYER, Johns Hopkins, xxv+149 pp. 50 cents *net.* The impressive story of a humble patriot.
WIEDEMANN; BIBLISCHE GESCHICHTEN. Edited by Prof. L. A. RHOADES, Univ. of Ills. *Vocab.* 93 pp. 30 cents *net.*

"THE BEST SELECTIONS" SERIES

Edited by SHERWIN CODY

A Selection from THE BEST ENGLISH ESSAYS

Illustrative of the History of English Prose Style. With Historical and Critical Introduction by the Editor.

The student of English prose style, whether he wishes to write prose himself, or to learn its elements, that he may judge the style of current writers, will find this a most suggestive and enlightening book. The general introduction defines and analyzes the essential elements of artistic prose, and the introductions to the different essayists point out the really important characteristic of each style. The selection, too, is fortunate in giving examples of ten great styles, all different and individual, which the student of English is invited to study and imitate.

"By reading such a book, with its intelligent historical and critical comments, it is possible for the average reader to get an idea of the English essay that cannot be secured elsewhere."—*Indianapolis Sentinel.*

"His choice, both of writers and their works, may be heartily commended."—*Boston Transcript.*

"He has written for the book a preface that is a gem."—*The Argonaut.*

A Selection from THE WORLD'S GREATEST SHORT STORIES

Illustrative of the History of Short Story Writing. With Critical and Historical Comments by the Editor.

Since its publication Mr. Cody's book has been adopted by twelve large universities and a score of smaller institutions, which is a demonstration of its practical worth. Nothing just like it has ever been available, and students of literature have been quick to recognize this fact. This volume is far more than a collection of short tales that may as conveniently be read elsewhere, as the series of fourteen introductions to the various stories constitute the only comprehensive history of short story writing as an art ever published.

In form and shape these books are especially convenient, being printed on thin Bible paper, so that in spite of their extensive contents they are scarcely three-quarters of an inch thick.

18mo. Price, $1.00 net; delivered, $1.06.

IN PREPARATION

THE BEST TALES OF EDGAR ALLAN POE
THE BEST POEMS AND ESSAYS OF EDGAR ALLAN POE

The publishers believe that these two volumes, especially the second one, offer the most original and striking study of Poe's art and personality ever printed. Even old students of Poe will be surprised to find in the new arrangement of Poe's criticism a detailed analysis of the general principles of novel-writing, and short-story writing, as well as the better known essays on poetry and examples of criticism of poetry, with his many pithy remarks on life and literature gathered from his journalistic book reviews.

The books will be of the same handy form and size as the "Short Stories" and "Best Essays."

Price, $1.00 net per volume.

A. C. McCLURG & CO. : : PUBLISHERS : : CHICAGO

IMPORTANT NEW BOOKS

Allen and Greenough's new Latin Grammar

for Higher Schools and Colleges.

By J. B. GREENOUGH, late Professor of Latin in Harvard University; Professors G. L. KITTREDGE and A. A. HOWARD, of Harvard University, and BENJAMIN L. D'OOGE, Professor of Latin in the Michigan State Normal College. (*In press.*) List price, $1.20.

This well known Latin grammar, although in a new form, still remains the Allen and Greenough Grammar in scope and in general plan, and retains the characteristic qualities that have given the book a world wide distinction. **But the work has been revised in every detail to bring it into harmony with the latest results of scholarship, and has been rearranged where necessary to make it as convenient for use as is possible.** The paragraphs have been renumbered throughout and the typography of the book has been completely changed. A new scheme of type display unquestionably marks the highest typographical achievement in books of this character.

A Latin Grammar

for Schools and Colleges

By W. G. HALE, Professor of Latin, and CARL DARLING BUCK, Professor of Comparative Philology in the University of Chicago. List price, $1.00.

A working text-book adapted to the needs of high-school and college students, and at the same time presenting the facts of the Latin language in their true relations to one another. In subject-matter, in arrangement, and even in its convenient and attractive mechanical form, this grammar stands out as a superior book which will repay the careful study of all teachers of Latin.

The Standard English Classic Series

Macaulay's Life of Samuel Johnson

With a Selection from his Essay on Johnson. Edited with Introduction and Notes by CHARLES LANE HANSON, Instructor in English, Mechanic Arts High School, Boston. 16mo. Cloth. xxxiii+94 pages. With frontispiece. List price, 25 cents.

Irving's Life of Goldsmith

Edited by CHARLES ROBERT GASTON, Teacher in the High School Department of Public School No. 52, New York City. 16mo. Cloth. With frontispiece. (*In Press.*)

These two new volumes in the Standard English Classics Series are the first to appear in the new binding of the series, which is characterized by its convenient size (16mo) and its semi-flexible green cloth stamped very clearly in gold ink.

College Entrance Examination Board Questions Set at the Examinations

Held June 15-20, 1903. 8vo. Half cloth. 118 pages. List price 60 cents.

This volume, which is issued in our Department of Special Publication, presents by arrangement with the College Entrance Examination Board, the examination questions in all subjects set by the Board at the examinations held June 15-20, 1903. The volume is uniform in size and binding with those containing the questions of the preceding years.

The New International ENCYCLOPAEDIA

It's a Glorious Thing to Know, and to Know That You Know

How to know—where to go for information—that's the question

Here's a Rich Mine That's Open to You

The New International Encyclopaedia

Is new, thorough, comprehensive—superior to all other works of similar nature. That's a very positive statement, but the facts justify it

Under the searchlight opposite, incontrovertible evidence is shown

The NEW INTERNATIONAL ENCYCLOPAEDIA

Includes 65,000 titles—over 100,000 subjects. 30,000 more than are covered by any other encyclopaedia.

In other words, The New International Encyclopaedia answers fully fifty per cent. more questions than any other encyclopaedia.

It contains 100 full page colored plates—over 7,000 other excellent illustrations. Comprises 17 large volumes—over 16,000 pages.

It's wholly new—brought down to to-day by the country's ablest specialists and editors.

It has the endorsement of America's leading thinkers, teachers and scholars. And that's what the searchlight shows.

Adopt Scribner Books

If Considered You Will Adopt These!

Gordy and Mead's Language Lessons (A First Book in English)
Burt's The Literary Primer
James and Sanford's Government in State and Nation
James and Sanford's "Our Government" (Local, State, and National)
Gordy's American Leaders and Heroes
Gordy's History of the United States
Ashton & Marsh's Plane and Spherical Trigonometry
Miller & Foerste's Elementary Physics

A Sufficient Reason in One Sentence

Gordy and Mead's Language Lessons are the simplest, straightest paths to writing, speaking, and knowing our English Language.

Burt's The Literary Primer is based upon word-getting, teaching of sounds, repetition of vocabulary, child's own activities, and contact with permanent literature.

James and Sanford's Government in State and Nation brings pupils face to face with government AS IT REALLY OPERATES and conditions as they really exist.

James and Sanford's Our Government is just as good for elementary classes (either first year of High School or last year of Grammar School) as the larger book is for more advanced students.

[*Wisconsin, Iowa, Illinois, New York, and Pennsylvania Supplements are in preparation.*]

Gordy's American Leaders and Heroes makes the personal character of our great men stand out clear as crystal in an epoch or crisis, and the beginning child learns that history is the record of human life.

Gordy's History of the United States was written by a GRAMMAR SCHOOL MASTER, and that is a great distinction nowadays.

Ashton and Marsh's Trigonometry moves in a direct line to the solution of triangles.

Miller and Foerste's Elementary Physics is elementary, and the experiments ARE the bases of the text.

HARVARD UNIVERSITY

FACULTY OF ARTS AND SCIENCES.

Admission to the Freshman Class.

Examinations for admission to the Freshman Class of Harvard College and the First-Year Class of the Lawrence Scientific School will be held in Cambridge, from September 21 to 26, 1903. For the programme of examinations, the rules governing them, and specimen papers, application should be made to JOHN G. HART, Secretary, 6 University Hall, Cambridge, Mass.

Admission to the Graduate School.

Graduates of approved colleges and technical schools are admitted to the Graduate School without examination. For information concerning the requirements of residence and study, and the terms of admission to candidacy for the degrees of A.M., S.M., Ph.D., and S.D., application should be made to the DEAN OF THE GRADUATE SCHOOL, 6 University Hall, Cambridge, Mass.

Admission as Special Students, or to advanced standing.

Persons who give satisfactory evidence of their ability to pursue courses of study under the Faculty of Arts and Sciences, may be admitted without examination as Special Students in Harvard College or the Lawrence Scientific School, or be assigned to whatever class in those departments (above the Freshman Class) their previous training may qualify them to enter. Application should be made to JOHN G. HART, Secretary, 6 University Hall, Cambridge, Mass.

MASSACHUSETTS, ANDOVER.
The Oldest Congregational Seminary
ANDOVER.
Begins its 96th year Sept. 16th, 1903.
Historic New England environment. 2,000 graduates, including men of all denominations. Student associate church work. Special lectures on Missions, Polity and practical questions. For catalogue, map and views fully descriptive of location, buildings, courses of study, lectureships and facilities, and for special information desired
Apply to Prof. C. O. DAY

MISS GIBSON'S FAMILY & DAY SCHOOL for Girls
2322 (formerly 2037) DeLancey Pl., Phila., Pa. 32d yr. Fall term begins Oct. 1, 1903. College Preparatory.

School Agencies.

THE FISK TEACHERS' AGENCIES,
EVERETT O. FISK & Co., Proprietors.
Ashburton Place, Boston; 1505 Pa. Ave., Washington; 156 Fifth Ave., New York; 414 Cent. Bldg., Minneapolis; 533 Cooper Bldg, Denver; 80 Third St., Portland; 203 Mich. Bldg., Chicago; 525 Stimson Block, Los Angeles, Hyde Block, Spokane; 420 Parrot Bldg, San Francisco.

ALBANY TEACHERS' AGENCY, 81 Chapel St., Albany, N. Y.—Provides schools of all grades with competent teachers. Assists teachers in obtaining positions.
HARLAN P. FRENCH, Proprietor.

SCHERMERHORN Teachers' Agency. Teachers—Schools—Tutors—Governess—Property. Tel. 6129 18th. JOHN C. ROCKWELL, Mgr., 3 E. 14th St., N. Y. C.

Teachers, etc.

A LADY, having Library School training and seven years' experience in library work desires a position in or near Philadelphia. A reference library or a private library preferred. She would also undertake indexing or other bibliographical work.
H., care of the *Nation.*

A LADY OF EXPERIENCE in Teaching and Travel desires a position or private pupils. Specialties, Greek and Latin of college and secondary school grade. Highest references. Address
"A," care of the *Nation.*

A LADY OF EXPERIENCE and Ability seeks an engagement as teacher, housekeeper, or chaperon. Thorough in English, Languages, and Music. Address SUCCESSFUL, office of the *Nation.*

To Let.

FOR RENT.—One of the most attractive houses in Asheville N. C.
House has never before been rented; is located in Victoria; completely furnished (linen and plate), with fine stables and all modern improvements.

THE MONARCH BILLIONAIRE
$1. By MORRISON I. SWIFT

Books on Scientific Socialism. Catalogue free. CHARLES H. KERR & Co., 56 Fifth Avenue, Chicago.

SCIENTIFIC PUBLICATIONS

Geographic Influences in American History

By Albert Perry Brigham, Professor of Geology in Colgate University. Author of "A Text-Book of Geology," etc. *Ready in September.*

This volume describes the physiographic features of America in order to show how they have guided the unfolding of our industrial and national life. The arrangement is mainly geographical. Closing chapters deal with the unity and diversity of American life and with physiography as affecting American destiny. The book is designed for the general reader and for students and teachers of geography and history.

Agriculture for Beginners

By C. W. Burkett, Professor of Agriculture; F. L. Stevens, Professor of Biology; and D. H. Hill, Professor of English in the North Carolina College of Agriculture and Mechanic Arts. 267 pages. Illustrated. List price, 75 cents.

The authors have prepared this little book in the belief that there is no line of separation between the science of agriculture and the practical art of agriculture, and that the subject is eminently teachable. Theory and practice are presented at one and the same time, so that the pupil is taught the fundamental principles of farming just as he is taught the fundamental truths of arithmetic, geography, or grammar.

Lessons in Physics

By Lothrop D. Higgins, Instructor in Physics in the Morgan School, Clinton, Conn. 379 pages. Illustrated. List price 90 cents.

Higgins' "Lessons in Physics" provides a thorough course in physics for schools which offer little or no laboratory work. Principles are explained by references to common or familiar phenomena rather than to set laboratory experiments.

Laboratory Physics

A Student's Manual of a Series of Quantitative Experiments

By Dayton Clarence Miller, Professor of Physics in the Case School of Applied Science, Cleveland, Ohio. (*Ready in September.*)

This Manual is designed to be a student's handbook for the performance of experimental problems in physics. The explanations contain the general principles and the real scientific meaning of the experiments, and outline in a systematic manner details of manipulation that will benefit the student and aid the instructor.

Mechanics, Molecular Physics and Heat

A Twelve-Weeks College Course

By Robert Andrews Millikan, Assistant Professor of Physics in the University of Chicago. 8vo, cloth, 242 pages. Illustrated. (*Nearly ready.*)

A book that combines the qualities of a class-room text-book and a laboratory manual. It aims to take the place of both and thus to obviate the most common difficulty in the teaching of physics; that is, the lack of an intimate correlation between the class-room discussion and the laboratory exercises.

The American Naturalist (New Series)

An Illustrated Magazine of Natural History. In its thirty-seventh year. Annual subscription $4.00 *net*, in advance. Single copies 35 cents. Foreign subscription $4.60.

It has a permanent constituency among the best classes of people.
It is found in nearly every library in the world.
It is quoted as an authority on scientific questions, so that even its early volumes are in constant use.
In its pages prominent scientific men discuss the most important phases of scientific advancement.

OXFORD UNIVERSITY PRESS

New Edition of the

LETTERS OF HORACE WALPOLE

Edited by Mrs. PAGET TOYNBEE

THE DELEGATES OF THE CLARENDON PRESS have arranged with MRS. PAGET TOYNBEE for the publication of *The Letters of Horace Walpole*, in as complete a form as possible. The work is now in the press, and will be issued in sixteen volumes. The first portion (vols. i-iv) will be published in November, 1903, vols. v-x will be ready in November, 1904, and the remainder (vols. xi-xvi) in November, 1905.

It is confidently expected that this new edition, the first for nearly fifty years, of the greatest English letter-writer of the eighteenth (or perhaps of any) century, will be practically final, no pains having been spared in tracing letters in the hands of private owners, and in public collections, in this country, in England, and on the Continent.

Mrs. Toynbee has been so fortunate as to obtain the use of over four hundred letters not included in the latest edition of the Collected Letters; more than a hundred of these have never before been printed.

The work will be issued in three editions, as follows:

I. 16 volumes, demy, 8vo, on hand-made paper, the number of copies limited to 260, at the subscription price of $125.00 *net* in cloth boards; $175.00 *net* in full morocco.

II. 8 double volumes, crown 8vo, on Oxford India paper, at the subscription price of $35.00 *net*.

III. 16 volumes, crown 8vo, on ordinary paper, at the subscription price of $27.00 *net*.

Specimen pages and further particulars will be sent on request.

OXFORD UNIVERSITY PRESS, American Branch,

91 and 93 Fifth Avenue, New York.

GANOT'S PHYSICS

SIXTEENTH EDITION.

REVISED AND IMPROVED.

BY

A. W. REINOLD, M.A., F.R.S.

Professor of Physics, Royal Naval College, Greenwich, England.

A General Elementary Treatise on Physics, surpassing all previous Editions.

William Wood & Co.

51 FIFTH AVENUE, NEW YORK

REMINGTON
Standard Typewriter
327 BROADWAY, NEW YORK

Take note of the following three good novels for your reading list:

ELEANOR DAYTON
By NATHANIEL STEPHENSON
Author of "They that Took the Sword."

THE MS. in a RED BOX
By the "dark" author

THE HOUSE on the SANDS
By CHARLES MARRIOTT
Author of "The Column."

The above all just published at $1.50 each, to be had of all good booksellers.

JOHN LANE : NEW YORK

FREE, masterpieces by Twain, Caldwell, Dr. Wayland (from MODERN ELOQUENCE), on New England Weather, etc. Send for Booklet No. 349, containing them complete. John D. Morris & Co., Suite 63, Commonwealth Bldg., Philadelphia.

LITTLE, BROWN & CO., Publishers, Boston.

Harvard Studies in Classical Philology.

VOL. XIV.

DEDICATED TO

PROFESSOR JAMES BRADSTREET GREENOUGH

NOW READY

This and other volumes of the Series may be had at $1.50 per volume, postpaid, of the

PUBLICATION AGENT OF HARVARD UNIVERSITY,
CAMBRIDGE, MASS.

A list of the Series, with Tables of Contents, sent on application.

The problem of learning to **speak** foreign languages has been solved. The following books are no longer an experiment:

How to Think in French
9th Edition. $1.00.

How to Think in German
7th Edition. $1.50.

How to Think in Spanish
6th Edition. $1.50.

If your bookseller does not keep them, send to the author, Prof. CHAS. F. KROEH, Stevens Institute of Technology, Hoboken, N. J.

By direct association the pupil acquires the command of the words and phrases of common life and learns to use them grammatically in all the ways possible to a native.

STUDY AND PRACTICE OF FRENCH in 4 Parts
L. C. BONAME, Author and Publisher.
930 Chestnut St. PHILADELPHIA, Pa.

Well-graded series for Preparatory Schools and Colleges. No time wasted in superficial or mechanical work. *French Text:* Numerous exercises in conversation, translation, composition. *Part I.* (60 cts.); Primary grade; thorough drill in Pronunciation. *Part II.* (90 cts.): Intermediate grade; Essentials of Grammar; 4th edition, revised, with Vocabulary; most carefully graded. *Part III.* ($1.00): Composition, Idioms, Syntax; meets requirements for admission to college. *Part IV.* (35 cts.): *Handbook of Pronunciation* for advanced grade; concise and comprehensive.

JOHN WILEY & SONS'

Scientific Publications

Quantitative Chemical Analysis

By the late C. REMIGIUS FRESENIUS. New Authorized Translation from the latest German edition in two volumes, by ALFRED I. COHN. Recalculated on the basis of the latest atomic weights, and also greatly amplified by the translator. 8vo, cloth. 2,000 pages. $12.50. *(October.)*

Introduction to the Rarer Elements

By PHILIP E. BROWNING, PH.D., Assistant Professor of Chemistry, Kent Chemical Laboratory, Yale University. 8vo, cloth, $1.50 *net.*

A Text-Book of Volumetric Analysis

With Special Reference to the Volumetric Processes of the Pharmacopœia of the United States. Designed for the use of Pharmacists and Pharmaceutical Students. By HENRY W. SCHIMPF, PH.G., M.D., Professor of Inorganic Chemistry in the Brooklyn College of Pharmacy. Fourth edition partly rewritten, 1903. 12mo, 582 pages, cloth, $2 50.

The Praxis of Urinary Analysis

A Guide to the Chemical Analysis of Urine. With directions for preparing artificial pathological urines for practising the various tests and an appendix on the analysis of stomach contents. By DR. LASSAR-COHN, Professor in the University of Koenigsberg. Authorized translation from the author's enlarged and revised second edition. By H. W. F. LORENZ, A.M., Ph.D. (Berlin), late Instructor of Organic Chemistry in the University of Pennsylvania. 12mo, cloth, $1.00.

Thermodynamics and Chemistry

A Non-Mathematical Treatise for Chemists and Students of Chemistry. By P. DUHEM, Correspondent de l'Institut de France, Professor of Theoretical Physics at the University of Bordeaux Authorized Translation by GEORGE K. BURGESS, Docteur de l'Université de Paris, Instructor in Physics, University of California. 8vo, cloth, 450 pages, 140 figures, $4.00. *(Shortly.)*

Essentials of Volumetric Analysis

By HENRY W. SCHIMPF. 12mo, cloth. *In preparation.*

Disinfection and Preservation of Food

By SAMUEL RIDEAL. 3d edition, Revised. 8vo, cloth. *In preparation.*

Treadwell's Analytical Chemistry

Vol. II. Quantitative Analysis, translated by W. T. HALL, Instructor in Chemistry, Massachusetts Institute of Technology. *In preparation.*

A Laboratory Guide to Qualitative Analysis

With the Blowpipe. By F. W. MARTIN, Ph.D. 12mo. Cloth. *In preparation.*

A Laboratory Manual of Physiological and Pathological Chemistry

By Professor E. SALKOWSKI. Authorized Translation from the second German edition by William Ridgely Orndorff, Professor of Organic and Physiological Chemistry in Cornell University. 8vo, cloth. *In preparation.*

Electrical Engineering

An Elementary Text-Book. Suitable for persons employed in the mechanical and electrical engineering trades, for elementary students of electrical engineering, and for all who wish to acquire a knowledge of the chief principles and practice of the subject. By E. ROSENBERG. Translated by W. W. HALDENE GEE, B.Sc. (Lond.), A.M.I.E.E., and CARL KINZBRUNNER. xiii+267 pages, 263 figures, 8vo, cloth, $1.50, *net.*

Systematic Pomology

Being Part II. of American Horticultural Manual. By J. L. BUDD, Professor Emeritus of Horticulture in the Iowa State College of Agriculture and the Mechanic Arts, Assisted by N. E. HANSEN, Professor in the South Dakota Agricultural College. vi. + 491 pages. 12mo, cloth, $1.50.

Principles of American Forestry

By SAMUEL B. GREEN, Professor of Horticulture and Forestry, University of Minnesota; Member of the Forest Reserve Board of the State of Minnesota; Author of "Forestry in Minnesota." 12mo, xiii+334 pages, 73 figures, including many half-tones. Cloth, $1.50.

The Gas Engine

A treatise on the Internal Combustion Engine using Gas and Liquid Hydrocarbons for Stationary and Automobile Practice. By F. R. HUTTON, Professor of Mechanical Engineering in Columbia University. 8vo, cloth, 500 pages, $5.00.

The Art of Pattern Making

By I. MCKIM CHASE. 215 figures, 275 pages, 12mo, cloth, $2 50.

Rustless Coatings

The Corrosion and Electrolysis of Iron and Steel. With illustrations. By M. P. WOOD, Member of the American Society Mechanical Engineers. American Association Advancement of Science, Consulting and Contracting Engineer. 8vo, cloth. *In Preparation.*

Free Hand Lettering

By VICTOR T. WILSON. *In preparation.*

The Elasticity and Resistance of the Materials of Engineering

By WILLIAM H. BURR, C.E., Professor of Civil Engineering in Columbia University in the City of New York. Sixth Edition, Rewritten and Enlarged. 8vo. 1,100 pages, illustrated, cloth, $7.50.

A Treatise on Concrete

By FREDERIC W. TAYLOR, M.E., and SANFORD E THOMPSON, Assoc. M. Am. Soc., C.E. 8vo, cloth *In preparation.*

Graphic Statics

With applications to Trusses, Beams and Arches. By JEROME SONDERICKER, Associate Professor of Applied Mechanics, Massachusetts Institute of Technology. 8vo, cloth, $2.00.

Irrigation Engineering

By H.M. WILSON. Fourth edition, reset and brought up to date. 8vo, cloth, $4,00.

Water Power

By Jos. P. FRIZELL. Third edition, revised and enlarged. 8vo, cloth, $5.00.

Architect and Builder's Pocket Book

By F. E. KIDDER. A new edition rewritten, 16mo, cloth, $5.00. *In preparation.*

Naval Architecture

By C. H. PEABODY, Massachusetts Institute of Technology. 8vo, cloth. *In preparation.*

Rational Geometry

A text book for the science of space, based on Hilbert's Foundations By GEO. BRUCE HALSTED. *In preparation.*

Technical Mechanics, Part II.

Completing the Work. By E. R. MAURER. *At once.*

Logarithmic and Trigonometric Tables

To Four and one-half Decimal Places. With Decimal Subdivision of the Degree. Prepared for the convenient use of officers and enlisted men of the U. S. Artillery Corps. By HENRY H. LUDLOW, Major Artillery Corps U. S. Army. 8vo, cloth. *In preparation.*

Mineral Tables

By ARTHUR S. EAKLE, Assistant Professor of Mineralogy, University of California. 8vo, cloth. *In preparation.*

JOHN WILEY & SONS,

43-45 East 19th Street, NEW YORK.

EARLY IN OCTOBER

WILL BE READY FOR THE UNITED STATES THE *THIRD* AND *LAST* VOLUME OF

CHAMBERS'S CYCLOPÆDIA OF ENGLISH LITERATURE

¶ This will *complete* what is conceded by every English-speaking critic in the world to be the most authoritative, comprehensive, accurate, and convenient general work of reference upon English literature in existence. It includes the whole range of English literature, from the earliest times to this day, and in all quarters of the globe.

¶ It contains over two thousand five hundred pages, 5½ x 8½ inches in type measure, clearly and handsomely printed on a fine, strong, white paper, and illustrated with approved portraits and drawings.

¶ It is substantially bound in sober green cloth, with dignified design and lettering in gold, and has gilt tops.

¶ It is edited by DAVID PATRICK, assisted by Mr. Edmund Gosse, Dr. Stopford Brooke, Professor Bradley, Professor Hume Brown, Mr. A. H. Bullen, Mr. Austin Dobson, Dr. Samuel R. Gardiner, Professor W. P. Ker, Mr. Andrew Lang, Mr. Gregory Smith, Dr. T. G Law, Mr. Sidney Lee, Mr. A. W. Pollard, Professor Saintsbury, Dr. William Wallace, and others.

THERE IS A DETAILED TABLE OF CONTENTS IN EACH VOLUME

The Price of

CHAMBERS'S CYCLOPÆDIA of ENGLISH LITERATURE is $5.00, *net*, per volume. Carriage extra

LONGMANS, GREEN, & CO.'S NEW BOOKS

HIGHER MATHEMATICS FOR STUDENTS OF CHEMISTRY AND PHYSICS

With Special Reference to Practical Work. By J W. Mellor, D.Sc. With 142 Diagrams. 8vo, 544 pages. Price, $4.00.

JOUBERT'S ELEMENTARY TREATISE ON ELECTRICITY AND MAGNETISM

By G. Carey Foster, F.R.S., Fellow and Emeritus Professor of Physics in University College, London; and Alfred W. Porter, B.Sc., Fellow and Assistant Professor of Physics in University College, London. Founded on Joubert's "Traité Elémentaire d'Electricité." Second Edition. With 374 Illustrations and Diagrams. 8vo, pp. xx—568. $3.50.

ELECTRIC AND MAGNETIC CIRCUITS

By Ellis H. Crapper, M.I.A.E., Head of the Electrical Engineering Department in the University College, Sheffield. 8vo, pp. xii—380. $3.60

A FIRST COURSE IN INFINITESIMAL CALCULUS

By Daniel A. Murray, Ph.D., formerly Scholar and Fellow of Johns Hopkins University; Professor of Mathematics Dalhousie College, Halifax, N. S. 8vo. [*In Press.*]

TREATISE ON THERMODYNAMICS

By Dr. Max Planck, Professor of Theoretical Physics in the University of Berlin. Translated, with the Author's sanction, by Alexander Ogg, M.A., B.Sc., Ph.D., late 1851 Exhibition Scholar, Aberdeen University; Assistant Master, Royal Naval Engineering College, Devonport. 8vo, $3.00.

FERMENTATION ORGANISMS

A Laboratory Handbook

By ALB. KLÖCKER, Assistant in the Carlsberg Laboratory, Copenhagen. Translated from the German by G. E. Allan, B.Sc., Lecturer n the University of Birmingham, and J. H. Millar, F.I.C., formerly Lecturer in the British School of Malting and Brewing. and Revised by the Author. With 146 Illustrations in the Text. 8vo. $4.20 *net*. By mail, $4.42.

THE CHEMICAL CHANGES AND PRODUCTS RESULTING FROM FERMENTATIONS

By R. H. Aders Plimmer, D.Sc. (Lond.). Octavo, pp. vi—184. $1.80 *net*. By mail, $1.90.

THE TEACHING OF CHEMISTRY AND PHYSICS IN THE SECONDARY SCHOOLS

By Alexander Smith, B.Sc., Ph D., Associate Professor in the University of Chicago, and Edwin R. Hall, Professor in Harvard University. With 21 Diagrams, References and Bibliographies and Index. Crown. 8vo, $1.50.

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 3, 1903.

The Week.

On the supposition that the Panama Canal treaty is dead, the friends of the Nicaragua route are again bestirring themselves. They are urging the President to proceed at once under the terms of the act of the last session which require him, in the event of failure to secure the right to build through the Isthmus of Panama, "to cause to be excavated and constructed a ship canal and waterway by what is known as the Nicaragua route." This he is required to do if the treaty with Colombia is not ratified "within a reasonable time." The President must decide for himself what is a reasonable time, but he will naturally seek the advice and concurrence of the leading members of the Senate and House of Representatives before taking an irrevocable step. The public temper is not now favorable to hasty action. Two years ago it was so prepossessed in favor of the Nicaragua route that Congress actually passed a bill appropriating money for it while a Government commission was on the isthmus examining the various routes for the purpose of deciding on the best and cheapest one. The final report of the commission and the lapse of time have served to cool the heated brains of all except Senator Morgan of Alabama. That the preponderance of public sentiment is now in favor of the Panama route is attested in many ways: by the ratification, on our part, of the treaty itself, by the appropriation of money to buy the property of the French Company, by the tone of the press, and by the very irritation which the adverse decision of the Colombian Senate has caused. If the inhabitants of Panama should revolt against that decision, it would be the first revolution in Central America in which we should feel a decided interest.

To read the sensational press, one might imagine that war with Turkey was imminent. The young lions of the yellow order are clamoring for revenge —for an offence which has not been committed; and are demanding a blockade which shall be "tantamount to a declaration of war." A newspaper which is planning to raise journalism to a place among the learned professions, is particularly active in this manufacture of fuss and fury. At present, bluster about Turkish matters seems safe enough; but if, out of the evil times that have fallen upon the Ottoman Empire, should arise a real cause of offence, the ravings of the baser press might inflame public opinion to the utter folly of driving the nation into the thick of the Eastern question. Those who boasted that the war in Cuba was "our war," would hardly halt before a greater crime against humanity—the full import of which they lack the moral sense to perceive. There is no longer any occasion, so far as public advices indicate, for sending a single American warship to any Turkish port; and yet the Mediterranean squadron is to rendezvous at Beirut, where it is not even certain that the American Consul has been murderously assaulted. Gilbertian comedy will hardly equal the dispatch of a squadron in the hope that it will find on arrival an outrage to justify its sailing orders. In the whole transaction, the President has shown a somewhat characteristic zeal for the attainment of ill-defined ends through inconsiderate means.

Gov. Taft retires on physicians' orders. That, it is explained, is the only reason why he has consented to withdraw from a work into which he has poured so much energy and devotion. Even his original rude health has been broken down by the Philippine climate. How long will his successor, Gen. Wright, be able to endure it? Are we to go on indefinitely, like the Spaniards and English, with a melancholy procession of high officials in the tropics invalided home? We have heard it maintained that one incidental blessing of our new insular dependencies would be the development of many "great administrators." What their fate will be, however, we may infer from the case of Gov. Taft. They will exhaust their vitality, and ruin their health—all for the sake of doing what can be better done by the natives. Gov. Taft's forced relinquishment of his post is one argument more for allowing the Filipinos to manage their own affairs. We but use up our stamina as well as our principles in forcing a government upon them.

The only question of importance in regard to Gen. Wright's accession to the Governorship is whether or not he will follow in Gov. Taft's footsteps. Is his promotion to mean that he will yield to the demands of 75 per cent. of the Americans in the archipelago, and give them the best offices and limitless chances to exploit the islands; or is he to stand upon his predecessor's platform of "the Philippines for the Filipinos"? The expectation in Manila is and has been that Gen. Wright, being a Southerner with a Southerner's view of men of color, will "put the niggers where they belong." But we think that the vulgar crowd of adventurers and shady characters, who form so large a part of our representation in the archipelago, are certain to be disappointed in their hopes. Behind Gen. Wright there will stand President Roosevelt, who supported and encouraged Gov. Taft in his every contention. To think that the President would permit Gen. Wright to play into the hands of the fortune-hunters, even if he so desired, is to believe the impossible. Whatever approval of its Philippine policy the Republican party has won, it has gained because of a belief that, despite its mistakes, it meant to do justice to the Filipinos in the long run. The President can honor himself and the country by making it clear that the policy of Gov. Taft is the policy of the Administration, no matter who the Governor-General may be.

The *Sun* points to the damning figures of the Philippine carrying trade—less than 2 per cent. going to "help" American shipping, while 98 per cent. went to pay dividends on foreign ships, "mostly British"—and asks, "When will Congress see the point?" Congress has already seen the point, and that is exactly what troubles the merchants engaged in business with the Philippines. When the law comes into effect which Congress has passed excluding foreign ships from the trade between Philippine ports and our own, what are the importers of hemp, for example, to do? The statistics cited show how inadequate, or else extremely expensive, is the American shipping service in the Pacific. It is roundly asserted by those who ought to know that the requisite shipping does not, and will not next year, exist, under the American flag. The real "point" is, therefore, whether Congress, in attempting to make the Philippine trade a part of our coasting commerce, has not rashly taken the most effective way to hamper it.

As befits one of the Executive Committee of the National Good Roads Association, Lieut.-Gen. Miles's final recommendations as Commanding General deal largely with roadmaking and vehicles which require smooth highways. Cavalry, to his mind, is now obsolete—in spite of the extraordinary successes of the mounted Boers—and so he would dismount 5,000 of our horsemen and set them to roadmaking and experimenting with bicycles, motor cycles, and automobiles. At the same time they are to supervise the construction by machinery of military highways, to be the joy of archæologists some centuries hence. A corps of 5,000 men engaged in national roadmaking would unquestionably add greatly to the country's prosperity and welfare. Who, for instance, could overestimate the change which would come over

any one of the Southern States if such a corps could operate in it for two years? It would almost amount to a social revolution, and the work would be vastly better for our troops than killing Filipinos or keeping them in subjection. But the military world will say that while martial Europe experiments with motor vehicles, there is no need for us to do anything but watch her. Experts will prove that while our cowboys might "overrun Mexico and Canada," they would not be soldiers in any other sense than were the Rough Riders in 1898, and will declare that all armies are turning towards the mounted infantry, which our cavalry is and always has been. And the scoffer will ask why Gen. Miles does not trot out that unutterably foolish "testudo," or two-wheeled shield for soldiers, on which he wasted thousands of Government dollars, and with which he blocked the railroads in 1898.

A very little investigation has disclosed the fact that every member of the Dawes Commission has a business interest in the purchase of Indian land. In other words, the entire Commission, which was appointed to see that the Indians got full value for the sale of any or all of their treaty rights, is bound by its relations to various land companies to induce the Indians to sell those rights cheaply. The disclosure of so callous a disregard of the ordinary obligations of official honor is humiliating to every right-feeling American, all the more that these double-dealing Government employees coolly defend their practices. Mr. Bixby, the President of the Commission, sees no impropriety in "private investment" in companies whose transactions he has to revise as a public officer, and adds, "My interest in trust [*i. e.*, land] companies amounts to very little." Apparently, Mr. Bixby would defend the United States Marshal who should take stock in a "moonshine" still—provided it were only a little one.

From two quarters comes illuminating comment as to the oath of membership prescribed by the Typographical Union: On one hand a Roman Catholic priest points out that the oath makes the union higher than the Church, and hence can be taken by no good Catholic; on the other hand, an inspector investigating the Chicago Post-office shows that men who have taken the vow of the Typographical Union cannot, without perjury, swear to support the Constitution of the United States. In other words, they would be ineligible for Government service should President Roosevelt's plan of swearing in all employees of the nation be put in effect. The vow which, though typographers take it readily, offends both Church and State, runs as follows:

"I hereby solemnly and sincerely swear that my fidelity to the Typographical Union and my duty to the members thereof shall in no sense be interfered with by any allegiance that I may now or hereafter owe to any other organization, social, political, or religious."

Of course, the Church and the State are in the strictest sense religious and political organizations. If the oath means what it says, it is treasonable; if it is to be taken in some Pickwickian sense, it is time for a Mr. Pickwick among the typographers to rise and explain what in the world it does mean.

It is reported that John Mitchell's forthcoming book, 'Unionism in America,' will contain much praise of President Roosevelt for interposing in the anthracite strike, and will contend that the principle of Government intervention in great strikes has now been established. That depends. If the miners, as it is rumored they intend to do, seize the Presidential year for a violation of their agreement and a renewal of their strike, which they might hope to win in a political exigency, the "intervention" would be apt to be of a very different sort from that of last year. The truth is, that the action of 1902 was highly exceptional, and cannot be depended on as a precedent. The President's course was extra-legal. But there might easily be a legal and obligatory intervention by the Chief Executive which the unions would not at all like. Domestic violence might go to such lengths in a strike that the authorities of the State would appeal to Washington. The Federal Government would be bound to take note. So it would of the failure of a republican form of government in any State—a plight to which the unions would push us if their proscriptive policy were fully carried out. Precedents for precedents, Mitchell may find that they are stronger against unionism than in its favor.

The conviction and sentence of Parks, the walking delegate, for extortion have aroused public interest extraordinarily. This would be unaccountable were not the case one where the mere individual is swallowed up in a movement in which something like a crisis has arrived. Otherwise, we should not see so many men of weight and sane judgment hailing the downfall of Parks as a momentous event. It is not that they care particularly about his repellent and reckless personality, but they have seen in him a type. If he were to succeed in his wild ambitions and lawless methods, he would embolden the thousands of agitators who were breathlessly watching his career, and would drive on the new trades unionism into fresh audacities of tyranny and corruption. Symptomatic of this is the action of the housesmiths in voting to continue Parks's salary while he is in prison, and to make him marshal of their coming parade, *in absentia*, by displaying his sash and uniform on the horse he would have ridden. This latter honor is suggestively like that paid at a military funeral.

Mr. Chamberlain's scheme found an unexpectedly cool reception at the Montreal meeting of the British Chambers of Commerce. At the outset Sir Wilfrid Laurier declared anything like Imperial Federation to be impossible, and asserted that all measures of Imperial reciprocity must be of a purely commercial nature:

"If we are to obtain," he said in part, "from the people of Great Britain a concession for which we should be prepared to give an equivalent, and if we are to obtain it also at the expense of the surrender of some of our political rights, for my part, I would simply say, 'Let us go no further, for already we have come to the parting of the ways.' Canada values too highly the system which has made her what she is, to consent willingly to part with any part of it for whatever consideration and even, sir, for the maintenance of the British Empire."

Although Sir Wilfrid hastened to add that he believed Mr. Chamberlain's plan involved no encroachment upon Canadian nationality, his previous plain speaking had been virtually a refutation of Mr. Chamberlain's main contention that a closer union between England and the colonies is indispensable. If Sir Wilfrid speaks for Canada in this matter (and his remarks were greeted with applause), it is evident that the Dominion is interested only in the bargain-and-barter side of the preferential scheme, and that to her prosperous citizens the sentimental considerations advanced by Mr. Chamberlain look like so much moonshine. Courtesy forbade saying so at the meeting, but the difficulty experienced in passing a very harmless resolution approving the reciprocity plan revealed vigorous dissent among the few and indifference among the many. In fact, there was a point at which it seemed likely that the merchants and manufacturers constituting the conference would refuse even a grudging vote of confidence. Only the personal interposition of the Governor-General saved Mr. Chamberlain that humiliation. By some slight jugglery with the phrasing of the resolutions, Lord Minto carried the delegates for some undefined form of Imperial reciprocity, with the proviso, however, that "due consideration be given to the fiscal and industrial needs of the component parts of the Empire."

In the Argyllshire bye-election, the first square fight on the Chamberlain tariff proposals, Chamberlainism was utterly routed. The western islands, in an election characterized by vigorous debate, returned the Liberal candidate by a majority of over 1,500, as against 600 for a Conservative in the last election. The constituency is made up of a group of

islands inhabited mostly by fishermen, small farmers, and the dependents of great families. Experimentally, then, it was ideal for Mr. Chamberlain's purposes. It is such people whom he must convince that the dear loaf will not increase the cost of living. But the point has been too fine to appeal to the shrewd peasants of the western islands. Their Scotch verdict on Mr. Chamberlain's glittering promises augurs ill for the success of his scheme in the Midlands. It should give Mr. Balfour pause, if he has imagined that Mr. Chamberlain's new issue would change the luck of unfavorable bye-elections.

The revelations in regard to the hopeless incompetency of the British War Office need astonish no one. They were sufficiently indicated on the firing line during the Boer war to have been thoroughly discounted. What the British public will now ask, as it turns over the humiliating record of the costly blunders and criminal errors just published by the Royal Commission is, What has been done and what will be done to reform the War Office and the army? So far Mr. Brodrick has next to nothing to show. His plan of dividing up the forces into army corps has met with a trifle more success than was anticipated. That is, the decentralization process has gone so far as to take some authority from the War Office and place it in the hands of corps and division commanders. But these army corps still exist largely upon paper. Mr. Brodrick has also done something in the way of reducing the regimental expenses of officers. But there have been no sweeping reforms, no real profiting by the lessons of the war. No general staff has been created, as in the United States and no attempt has been made to improve and coördinate the system of instruction for officers. The Commander-in-chief is almost as much without power as was our own Commanding General, and the War Office is still the scene of social and family intrigue. Nor is there any one in sight who can really reform the army. Mr. Brodrick has shown himself, both in his office and on the floor of the House, wholly unable to think out and carry through the drastic reorganization so earnestly needed.

The split in the councils of the Social Democrat party in Germany is of far more than local interest. The question at issue is whether the organization is to continue its policy of stubborn hostility to the Government, or whether it is to become a progressive and enlightened opposition, capable of formulating and carrying to the front constructive measures for the betterment of social conditions. The younger element in the party, as led by Herr Bernstein, is in favor of assuming legislative responsibilities and of having a representative of the Social Democracy among the vice-presidents of the Reichstag, even if that official should have to stand in the presence of the Emperor from time to time. The hissing of Bebel, the veteran who still clings to the obstructionist theory, in the present convention in Berlin would seem to indicate that for the moment the younger men are in the ascendency. Should the change of policy occur, it will show that parties, like demagogues, are sobered by responsibility. It would doubtless draw to the Social Democrats many voters who still think of the party as one bearing the torch of anarchy, or of revolution, and fail to perceive in it the party of genuine social progress and reform, which it is slowly becoming.

The order for a retrial of the ensign, Hüssener, who last spring stabbed and killed a classmate for failure to salute him properly, is the announcement of a great victory for public opinion. Generally, in such cases, the military overlords from whose domination Germany suffers, pay no attention to the demands of an outraged people or of the press. But the Hüssener case has stirred the country as nothing heretofore—not even the "German Dreyfus case," when two innocent sergeants were almost done to death for the murder of their captain. Largely owing to the teachings of the Social Democrats, the average citizen is beginning to open his eyes to the true meaning of militarism, while the friction between officers and civilians grows apace. The Hüssener case itself illustrates the advantages gained by the public in doing away with secret courts-martial. The facts, as brought out, were soon spread broadcast throughout the land. To add to the popular indignation, there have been several brutal non-commissioned officers found guilty within the last few weeks of hundreds of outrages upon their unfortunate subordinates—in one instance there were 1,800 specifications. The sad suicide of a one-year volunteer of excellent family because he could no longer endure the tortures inflicted upon him, is another case which has shocked the country. And the Emperor could in a day or a month end it all—brutalities by non-commissioned officers, hazing, duelling, ill-treatment of subordinates by officers, and the frequent killings in defence of "military honor."

Spain's troubled condition is witnessed to in many ways. The frequent changes of Ministry imply a breaking down of the party system, such as it is, by which the Peninsula has been so long governed. The new Premier, Señor Villaverde, is primarily a financier, and his absorbing concern is with reorganization of the public service and economy. With this last, however, the demand of the military element and, it is said, of the young King himself, it at war. Their cry is for a restoration of the navy and the strengthening of the army. But the Prime Minister, while professing warm sympathy with all national aspirations, insists upon putting the demand of the pieman upon Simple Simon, "Show me first your penny." All this makes trouble, and on top of it comes a threatening revival of the Republican agitation. Linked partly with Socialism and the workingmen's movement, this party contends that the monarchy is a failure, and that the present government is driving the people to despair. "The only Indies which Spain has left," declares one Republican orator, Señor Joaquin Costa, "are the working classes. Let her be on her guard against losing them also!" Premier Villaverde presents, on this side, too, an unyielding front; but the difficulties before him are unquestionably enormous. So great are they that the Madrid correspondent of the London *Times* predicts something like a revolution in Spain within the near future.

The announcement is made that the Czar has appointed M. de Witte President of the Committee of Ministers. It is assumed in the press dispatches that this act makes him virtually Premier of Russia, and introduces some change in the political system of the Empire approaching the methods of western Europe, in place of the autocracy heretofore existing. In particular the appointment of a Prime Minister would tend to coördinate the now badly adjusted Ministries, and so might work a radical reform of the unwieldy Russian bureaucracy. If such a change has been made or is contemplated, the appointment of M. de Witte to the chief place in the councils of the Czar is an auspicious omen, since he, more than any other Russian statesman known to the outer world, stands for peace and the internal development of the Empire. All his reports as Minister of Finance have dwelt upon the necessity of peace to the great work of uniting and harmonizing the diverse and widely separated parts of the Czar's dominions. The future greatness, perhaps the continued existence, of the Empire depends upon its economical progress and betterment. The recent strikes, with their bloody consequences, are the outgrowth of desperate poverty among the working classes. It is M. de Witte's policy to restore order by removing the causes of discontent rather than by shooting down the strikers. It has been his aim also to avoid troubles in eastern Asia by letting time do its work for Russia in Mantchuria instead of inviting collisions with Japan, or other Powers, which would interrupt the civilizing agencies now in operation and absorb the resources upon which they depend.

THE CASTE NOTION OF SUFFRAGE.

Southern newspapers have persuaded themselves that the raising of the question of the negro's political rights may elect a Democratic President. Thus, the New Orleans *Daily States* declares that the Republican managers are "afraid of the race question." On the other hand, the Macon *Telegraph* represents the Democratic leaders as eager to make it the main issue. "A campaign on this issue in the North would at least win enough Republican votes in the doubtful States to offset the vote of the negroes." More telling, however, than any such vague forecasts is the revelation which the *Evening Post* was able to make last Friday of the real attitude of Northern Democrats. If they are so hot to take up the issue of discriminating, by suffrage laws, against educated and property-owning negroes, it is somewhat surprising that more of them were not, on that journal's individual solicitation, willing to say so. The astonishing silence which a direct question has produced in men ordinarily voluble, is of great political significance.

The truth is, of course, that the issue of equality before the law, for the negro as for everybody else, is one upon which, when nakedly presented, all Americans must publicly agree. Privately, men may say that they are for inequality. They may even vote for it, in secret; but they cannot speak for it. And let it be borne in mind that it is simply the question of treating the negro citizen like every other citizen which is now pressing to the front. There is no demand that the South make electoral laws which will admit every ignorant or vicious colored man to the ballot. Let the qualifications for the suffrage be what the separate States see fit to make them; only let them be impartially and honestly applied. What is destructive of all justice is discrimination against the intelligent and well-to-do negro, at the same time that the door is flung wide open for white men whom the very framers of Southern State Constitutions admit to be steeped in ignorance and vice. That is an attempt to build a democracy on the exclusion of a race; and if is the word of an American statesman who, being dead, yet speaketh, that no nation so builded can endure. This is the thing—unequal enforcement of the law; making flesh of the white man and fish of the negro; the adroit effort, under cover of crafty statutes, to destroy the political rights written into the supreme law of our land by what Sumner called "irreversible guarantees"—it is this which has begun again powerfully to stir the hearts and consciences of lovers of liberty in this country.

Mr. Shepard, who alone replied squarely and at length to the *Evening Post's* inquiry (Mr. Cleveland professed himself unwilling to trench on his vacation), admits, as might have been expected, that his sense of justice is offended by the exclusion of qualified negroes from the suffrage. To favor whites above the blacks dwelling under the same laws is, he candidly says, to trample upon the Declaration of Independence and violate the express law of the land. This is a grievous and terrible thing, in Mr. Shepard's eyes, yet he would have nothing done to correct it. The penalties specifically pointed out in the Constitution he would leave unenforced. Even that political redress which Mr. Justice Holmes pointed out as the sure remedy for oppression of the negro citizen, Mr. Shepard deprecates. He excuses the South while blessing her. She is only doing what the North would do in her place. And then we have the familiar old talk about "racial" inferiority and the superiority of the white man as such.

Now this, to be perfectly frank, is the talk of a man who believes in caste. The idea of the suffrage now inculcated in the South is one which Mr. Shepard would apparently endorse—namely, that the most embruted white man is better fitted to vote than the most cultivated black man. It is the inveterate prejudice, the superstition, even, of caste which speaks in that. It dismisses all facts, flouts the noblest sentiments, spurns the most pathetic appeals—and all on the old unproved assertion that the worst white man is better qualified for representative government than the best black man.

We see from Mr. Shepard's words, as we may from Mr. Bryan's dreadful inconsistencies, how hollow will ring Democratic protests against the oppression of the Filipinos while there is Democratic acquiescence in injustice to the negro. It would even appear that the great reason for making the Philippines independent is lest, if we hold them, we shall keep the brown men under our heel abroad as we mean to keep the black men at home. Self-government, the right of representation, all the traditional cries of American freemen, are to be kept purely for use 7,000 miles away, while conveniently forgotten in this country. The campaign of the Democrats would be, in that respect, one of overflowing love for the brown brother whom they cannot see, but of callous disregard of the black brother whom they can see.

Open discrimination against the negro as a voter cannot stop there. It really means discrimination against him as a man. That is why we think it so hateful and perilous. It signifies a willingness to extinguish the hope of an entire race. Instead of encouraging its members to rise, and rewarding them when they do rise, it would close the door of opportunity to them all. That is the true implication of the exhortation to the colored men to give up their "nonsense" about political rights and to turn to "useful" pursuits. It means that what is wanted is a subject class of willing or forced workers. Wrapped up in the caste spirit which would shut the negro out from his political rights, is the intention to deny him his human rights.

WORKING OF THE NEW MILITIA LAW.

The disbandment of the famous Washington Artillery of New Orleans because its members declined to serve under the Dick militia law, the passage of which was one of the achievements of Secretary Root, indicates one of several misunderstandings of the statute. Indeed, it may be doubted whether the public has any clear idea as to what Congress has accomplished by this legislation. In the South, particularly, there has been much uneasiness. Some of the newspapers have read into the law an invasion of State rights. One Louisiana journal has even feared that Mr. Roosevelt might use Southern militia to back him up in his anarchistic policy of giving office to an occasional worthy negro.

All of this anxiety is needless. As far as the power of the States over their militia is concerned, the Dick law merely reaffirms what was already in the Revised Statutes. It is true that the President is given the right to fix the number of men in a company, and to prescribe such rules and regulations as he sees fit. Whether the States will accept them is another matter. This question they have five years to decide. The President has no means to force New York, for instance, to accept the rifle-practice regulations which have already issued from the War Department for the guidance of the militia, unless it be by withholding the State's share of the Federal militia appropriation. When it comes to the ordering out of the State troops, the President has no real powers beyond those granted by previous legislation. He can still, in accordance with the Constitution, call out the militia to repel invasion, to put down insurrection, or to enforce the laws. For this purpose he may send an order direct to such militia officers as he may select. But in all this procedure there is nothing new or revolutionary.

Looking at the development of the militia as a whole, its friends may be said to be divided into two camps, those who would make of the militia a trained, national reserve for the regular army, and those who would make it primarily a more efficient body of State troops. The views of the former were set forth by Lieut.-Col. James Parker of the army in the August *North American Review*. He has been up to this time in charge of National Guard matters in the War Department, and therefore speaks with considerable authority. His idea is that the State troops will become "our second line of defence." In imagination he sees,

on the outbreak of war, our National Guard regiments taking the field with the regulars, uniformed, armed, and equipped like them, and ready to go to the firing-line until relieved by newly formed regiments of volunteers—the "third line."

Those who oppose these views laugh at the belief that State troops can ever be made ready to take the field at once as complete organizations. They are right, for the Dick law (section 7), it now appears, requires the physical examination of all such soldiers to ascertain if they are "fit." To muster in our New York regiments according to regular-army tests would merely result in the discharge as unfit of three-quarters of each regiment, the enlisting of raw recruits by the hundreds, and all the chaos of 1898 over again. The militia cannot be recruited in peace times, in any State, according to army physical standards—not even in New York city. On the other hand, there cannot be two physical standards in war time, one for regulars and one for militia—the protection of the Treasury from pension grabbers forbids this. Plainly, the idea of a "second line," ready for instant service, is blocked by this impassable obstacle. As before, the militia in war time will be able to take the field only after a reorganization, in which the militiamen physically able to enter the United States service will be the instructors of the recruits who will flock to each regiment. How foolish, in view of these facts, appears Lieut.-Col. Parker's statement that "under this law the President is able to muster into the service of the United States, at once, . . . the whole National Guard of 150,000 men [*sic*] in brigades, regiments, and battalions, *as they stand*, fully armed and equipped, mobilized, and ready for active service at six hours' notice."

Yet there are distinct benefits to be expected. The law fixes the War Department's attention on the militia. It enables the Department to offer substantial advantages in the way of joint manœuvres of regulars and militia, without cost to the latter; to instruct militia officers at the service schools; to furnish arms, ammunition, and equipments to States in greater quantities than heretofore, and also larger cash allowances. It creates a list of tested volunteer officers to be called upon in war time. It permits the appointment of regular officers to duty with State troops, and, above all, it repeals a number of obsolete laws and brings together in one place various scattered parts of the statute law relating to the militia. There is thus no valid excuse now for the man who fails to understand precisely to what State and national duties he pledges himself when he enlists in the National Guard. Finally, the law requires the annual inspection of each company, and twenty-four drills in each year.

Just how much the State troops will benefit in the long run by the new régime will depend largely on the amount of tact and intelligence displayed by the War Department. If the problem is approached in the proper spirit, a great deal should be accomplished by unifying the various militia systems, and by inducing State Executives and commanding officers to follow regular-army methods wherever possible. Shortcomings should be freely pointed out, but in such a way as to win the sympathy and interest of State officers, Manœuvres, for instance, should be planned with regard to the needs of State troops, and not merely in the interest of the higher regular officers who would make experiments in strategy. In issuing suggestions, in the form of orders, to the militia, care should be taken to advise the adoption of rules and regulations which are within the powers of the National Guard.

But whether the administration of the law is to be wise or shortsighted, the fact remains that there has been no radical change in our militia, and that it is the same body of State troops it was before the passage of the Dick bill. Each Governor may order his troops where and when he pleases. The State Legislatures alone can determine the size of their militia. If the Federal Government calls out State troops, it can do so only for nine months, as in 1861, and it can no more send them overseas than it could in those stormy days.

TOM JOHNSON'S "VICTORY."

Ohio political manœuvring is doubtless to be judged by Ohio standards. Under an ethical code which has given peculiar significance to the term "Ohio politics," gaining control of a convention by throwing out the other fellow's delegates amounts to a demonstration of energy, astuteness, industry, and political ability in general. Tom L. Johnson accordingly appears to have proved his possession of these valuable qualities. He "owns" the Democratic State Central Committee. This body passes first upon the credentials of delegates and makes up the temporary list. No person whose name is not on this list is admitted to the convention, and the committees, including the committee on credentials, are appointed by a temporary chairman chosen by these admitted delegates. Thus to control a convention, begin with the State Central Committee. After that, everything else is easy. Some opposing delegates may be elected, but it is not difficult to get up a contest, and the committee will do the rest. One who accomplishes this successfully is certain to be hailed as a political master—in Ohio.

In many respects Johnson's victory in the Ohio convention is empty. Election figures in that State since 1896, when the blight of Bryanism began to thin the ranks of the Democratic party, show the process of elimination by which Johnson has maintained himself in power. In 1897 Bushnell, the Republican candidate for Governor, received a plurality of 28,000. Nash increased this in 1899 to 49,000. In 1901 Gov. Nash was reëlected, this time with a plurality of 67,000. Last year Laylin, the Republican candidate for Secretary of State, was elected by a plurality of more than 90,000. There is small reason to expect that the progressive decline will be checked this year. Johnson's policy of elimination was never carried on more vigorously than at present. To cast out those who oppose him seems to be in him a fundamental political instinct. He possesses it in common with many another minority leader.

Whatever importance attaches to the convention centres about Johnson as a possible national figure. He has been widely advertised as the probable heir of Bryan, whom in many respects he greatly resembles. If he intends to claim the inheritance, the late convention was undoubtedly offered as a pledge of good faith. It was a Bryan convention. It reaffirmed the Kansas City platform; it invited Bryan to come in person to Ohio to engage in the canvass; it did everything in its power to disgust and affront those who would have the party forget its past follies and again become a living force in the nation. There were few conservative delegates to protest, for the Credentials Committee, under Johnson's orders, had refused to seat them, for the most part. The only real contest which took place, over endorsing a candidate for United States Senator, was between Johnson's followers and even more radical Bryan men, who refused to follow their leader in the support of Clarke because, in 1896, Clarke voted for McKinley rather than for Bryan. That he returned to the fold in 1900 was not enough. If there had not been an evident confusion in Johnson's own mind as to the best course to follow, the ultra-Bryan element would doubtless have had its way, in the endorsement of some straight-out silver man for Senator.

It is not easy to see how Johnson has gained anything by his victory, bought, as it appears, at a very high price. He has shown himself a willing heir of the disaster of the Bryan régime; but he has revealed no capacity for a better sort of leadership. There is nothing to indicate that, if he were nominated for the Presidency by the Democrats next year, he could win one vote which would not more readily be cast for Bryan himself. For nearly a decade Bryan has been adding steadily to the strength and power of the worst Republicans. The Quays, the Platts, the Hannas of the party have found in him a ready and trusty, if unconscious, ally. Bryan's warfare, nom-

inally against Republican policies, has really been directed against the element of his own party which refused to follow him. To this conflict he has devoted his best energies. For this he has rallied his followers when ready to abandon the rest of the fight. It is this leadership which Johnson has taken up. In bitterness toward those who do not agree with him, in the reckless use of methods which deplete the ranks of his party yet for this very reason add to the strength of his control, Johnson has proved himself the equal of Bryan. If this is the quality which the Democratic party is looking for, after its experiences of 1896 and 1900, Johnson is the logical candidate in 1904.

Evidently, the break from Bryanism is not to be easily accomplished. This is one of the clearest lessons of the Ohio convention. It is not in that State alone that the domination of the Bryanites will continue for a time because of their possession of the party machinery. It is not to be supposed for a moment that there is no Democratic voice in Ohio raised for conservatism and wiser policies. But this sentiment was practically unrepresented in the convention because the State Committee was in the hands of the Bryanites. The same condition will rule elsewhere. It took the Democrats of Iowa two years to rid themselves of the party incubus. An attempt in 1901 to ignore the Kansas City platform was defeated on the floor of the convention by a vote of 669 to 550, and it was not until this year, and then only by the narrow margin of 464 to 353, that reaffirmation was outvoted. A longer process, it is now plain, will be required in Ohio, for Johnson's power over the machine was increased rather than diminished last week. The Democrats of Nebraska, likewise, have renewed their devotion to Bryanism, Populist alliance and all.

TRUSTS AND THE BAR ASSOCIATION

Whatever may be said of the value of the specific recommendation in regard to Trusts, made on Thursday by the American Bar Association's Committee on Commercial Law, there is no denying the importance of any utterance from such a source. The Bar Association is still one of the most influential bodies in our national life, and one of the most representative. When it is the unanimous opinion of one of its committees that the American Bar should lead in the work of regulating the great combinations of capital which are now the striking feature of our industrial life, lawmakers and publicists everywhere must give their attention.

There can be no dissent from the committee's belief that a United States Securities Company might easily have followed the Northern Securities Company. Nor is the picture of a future J. Pierpont Morgan combining all the industries of the land, so that there shall be but one possible employer and but one possible seller, without some warrant in view of our present industrial tendencies. When the heads of great railroads and commercial combinations openly state their belief in the continuation of such amalgamations as we have witnessed, and even on a larger scale than heretofore, it would ill become those who have to deal with the law to pay no attention to the future. For the courts must follow, however fast trade and industry may lead. Coincident with the growth of Trusts has been the creation of a law of Trusts. But the question really before the legal profession, as well as the nation, is simply whether the courts and the legislatures behind them shall hinder or facilitate the process of industrial combination.

The Bar Association's committee is not content with a mere verbal opposition to monopolies present and future. It proposes three distinct remedies: taxation to death or until the growth of great combinations is impeded; regulation in the case of all companies which are subject to the interstate commerce laws; and competition by the State. None of these is new, but their presentation at this moment should recall to the public mind the extent of the powers which inhere in the Government. That the power to destroy by taxation may be wielded by the Federal Legislature has been implied in decisions of our highest tribunal. The extent of its powers of regulation, under both the interstate commerce clause of the Constitution and recent legislation, is now in process of development in the Federal courts. But into no interpretation of the Constitution has there yet been read the right of the Government to engage in any form of manufacture, or to become the competitor of the Trusts.

This suggestion of the committee sounds rather like a counsel of desperation. It will be welcomed only by those who desire the nationalization of all industry, like the speaker at the Peace Conference at Mystic on the same day, who would purchase industrial peace by the common ownership of all the machinery of production and distribution. But the proposal itself is another sign that, as all roads lead to Rome, so all the highways of combination over which we are now passing lead inevitably to national ownership. The advocates of collectivism rejoice in the growth of the Standard Oil Company as they do in that of the United States Steel Company. They affirm with truth that the greater these combinations become, the greater is the evident necessity for the public to defend itself against them. They are confident that in the long run the only possible means of defence is for the people to take the power from the hands of a few enormously wealthy men. Similarly, the single-taxers see in the piling up of capital and the growth of monopolies the rapid approach of the millennium in which they believe.

In short, in the soil of our present industrial conditions there flourishes many a noxious growth. "Golden Rule" Jones and "Tom" Johnson find their opportunity to take root in it and develop strength they could not have in saner—and poorer—times. Moreover, they are too significant to be dismissed with a word. As long as our Trusts wax unchecked, there is powerful ammunition at hand for men like these. We must confess to a regret, therefore, that the Bar Association's committee wasted a moment upon the futile vision of a government underselling a Steel Trust or an oil monopoly. Even if the Constitutional power were at hand, who could conceive of such a state of affairs in practice? In certain limited fields, such as the making of rifles, and cannon, and the construction of warships, the Federal Government has become a manufacturer. We know of no case where such industrial ventures have equalled, much less surpassed, the achievements of private capital similarly invested. And of what use as a regulator of Trusts would be a Government concern which could not outstrip its rivals in economy and speed of production?

Encouraging as it is to have the Bar Association's committee describe the remedies within reach, they might well have looked a little further into the future and portrayed the ultimate goal of unchecked combinations. This is the psychological moment for such an authoritative utterance, not merely because of the growth of Trusts, but because of the unions of laborers on the one side and employers on the other. If any one doubts the evils which follow such associations, let him read Mr. Ray Stannard Baker's account, in *McClure's*, of the way employers and laborers have fleeced the middlemen in Chicago. The same tendency is brought out in the letters of the staff correspondent of the *Evening Post* from that city. The inevitable result of such alliances is the plundering of the consumer and the stifling of competition, which is to-day as much as ever the very life of trade and the surest foundation of national prosperity.

LABOR IN SOUTH AFRICA.

"A topheavy community" is the term applied to Johannesburg by Mr. Arthur Hawkes in a vivacious article in the *Review of Reviews*. The phrase describes well enough British South Africa as a whole. The gold and diamond craze, ably abetted by the campaign of Cecil Rhodes's agents, has peopled the country with managers and employers. Labor is deficient. The British South Africans, unlike the strudy pioneers of Australia or of our West, have evaded the

common pains of conquering a new country. South Africa may have been won in the smoke of British rifles; it has not been redeemed by the sweat of British brows. During the great period of expansion the syndicates and their salaried employees made up a large part of the immigrants, and so a top-heavy community has arisen, created prematurely from Lombard Street, and unprovided with that foundation of a healthy social order, an industrious laboring class.

The advance agents of empire seem to have left out of their South African calculations South African human nature. The Beits, Rhodeses, and Barnatos were apparently as indifferent to the human material with which they had to work as Mr. Chamberlain and Mr. Milner were later contemptuous of Boer ways of thinking. In the heyday of the syndicates a very thinly veiled form of peonage kept the Kaffirs at work in the mines; now that the powers of the companies have been abridged it is difficult to get labor for the mines, while projected new railroads and the rehabilitation of farming and ranching will still further deplete the labor supply of the Rand. In addition to the actual shortage of laborers the easy, desultory habits of the native blacks bring about in South Africa generally a more distracting condition than exists in the darkest regions of our own South. The farm laborer in Rhodesia, after a short term service, buys him a wife, supported by whom he lives happy ever after. Of the Kaffirs writes Mr. Hawkes: "They work part of the time, rest most of the time, and talk all the time."

Before this emergency two views are commonly advocated. First, the natives must be forced to work; second, workmen must be imported in great numbers to carry on existing and planned enterprises. Most colonists frankly preach the gospel of work—for the native—or the cowhide and prison pen. As Dr. Blyden, a former Minister of Liberia, put it euphemistically, when discussing the Belgian practices in the Congo State: "It needs something more than persuasion or denunciation to make the native see that it is his bounden duty to toil in order that a foreigner may enrich himself and live at ease." But that "something more" is abhorrent to the humanity of stay-at-home Imperialists, and it is not surprising that Lord Milner and Mr. Chamberlain choose to hang on the other horn of the dilemma—wholesale importation of contract laborers.

In the very instructive correspondence between the Colonial Secretary and the Governor-General, the latter has consistently taken the ground that the Kaffirs are fitted only for underground labor, and that they are morally an appurtenance of the mining industry. He accordingly proposes that, for Government railroads and the like, coolies or Chinese be imported under contract for a term of years—seven is suggested, with provision for their control while in South Africa and for their subsequent deportation. To this plan Mr. Chamberlain has given a qualified assent, insisting, however, that this temporary wardship must be conducted in a manner acceptable to the moral sensibilities of England and to the wishes of the Indian Government.

Since those sensibilities are pretty thoroughly seasoned from South African exposure, obstacles to Lord Milner's impressment will come less from humanitarian holders of "Kaffirs" than from leaders at the Cape and elsewhere who fear the further complication of a race problem already involved enough. One need not, with the alarmist press of Germany, imagine British South Africa on the brink of servile insurrection, to perceive that there is, from Rhodesia to the Cape, a race problem as threatening as our own. Chinamen, so long as Lord Milner's principle of "Kaffirs below ground, foreigners above ground," was lived up to, would perhaps get along with the natives. Coolies would probably be a very dangerous element in the South African chaos. In slipping such a foundation under the wobbling Imperial structure, the repairers might be very like workmen who lay their bricks in dynamite.

Nobody seems to consider the obvious moral solution of the crux—repentance and patience: repentance of an exploitation conducted with reckless haste; patience until the Kaffirs shall have learned to work, or until the natural demand shall have drawn to South Africa laborers who come not under bondage, but of their own free will. So simple an attitude will hardly be taken by those who have gold or diamonds to dig, or rails to lay on the veldt. Those peaceful processes which have hitherto made pioneer nations great, are too slow for Lombard Street pioneers with dividends to pay. It seems as if the gods, having given to our generation boundless energy, had withheld wisdom. No more telling instance of the arrogance of the new Imperialism could be furnished than this, that, lacking the absolute power of life and limb of the old Imperialism, it constitutes itself a special Providence and moves human beings about as counters on the industrial board. Let whoever still cherishes the Disraeli vision of *imperium et libertas*, ponder Lord Milner's plan of impressing yellow men for seven years of "compound" life in distant British possessions.

KHARTUM AND OMDURMAN.

KHARTUM, March, 1903.

The Mahdi captured Khartum, and Gordon was killed on the night of January 26-27, 1885; and till Kitchener defeated the Khalifa on September 2, 1898, at Omdurman, and reoccupied the heap of ruins which had once been a town of some 70,000 inhabitants, this district was as inaccessible as any part of Thibet. What happened on that awful day, when the victorious army of fanatics which had been kept at bay for 317 days by the valor and personal influence of one man, broke through the flimsy defence of this town of Khartum, will never be accurately known. Four thousand are said to have been massacred before the Mahdi ordered his followers to stay their hand. Gordon was one of the 4,000, and met his death with as calm a sense of certainty that the spear-thrusts of his enemies simply admitted him to the realm of the immortals, as that which inspired the successor of his opponent, the Khalifa Abdallah, fifteen years later—when utterly defeated by Col. F. R. Wingate at Om Dekribat on November 24, 1899—to seat himself with his emirs within range of the rifle fire, and invite death rather than surrender.

The battle of Kerreri took place less than five years ago, and we have just returned from the public garden where, for two hours, the Sudanese Military Band, led by a bandmaster as black as coal, dressed as trimly in European uniform as the bandmaster of an English regiment, played an overture by Auber, and waltzes and Molloy's songs, accurately, in tune and with feeling. In these same public gardens an agricultural and industrial exhibition had recently been held, and they are approached from the front by a boulevard on the banks of the Blue Nile, lined for a distance of two miles from the recently completed Gordon College with handsome Government buildings and private villas. The Khedival Avenue, from which the public gardens open on the rear, has been laid out with four rows of shade trees, and is being rapidly lined with substantial business and private houses, including two banks. Parallel to these, other spacious thoroughfares have been cut through the site of the old native town, and of the cemetery where so many of Gordon's faithful followers lie unnamed, whose lives were troubled by his enemies, and whose remains are now being disturbed by his friends. And these avenues are crossed by streets laid out on the same most liberal scale, and which are being so rapidly built upon that the wide space between the town and the defensive walls and trenches which Gordon built and dug between the Blue and the White Nile, will from all appearances soon be occupied; and those fortifications on which he so fruitlessly relied will become mere matters of record, like the romantic events of which they are to-day almost the only, vanishing monuments.

The amount of regenerative work done in the short period since the crushing battle of Omdurman or Kerreri is astonishing, but it is not so amazing as the faith in the future of the country and in their own ability to develop its latent resources which is thus evinced by its conquerors. It seems so short a time ago since Khartum was abandoned to utter darkness and the tyranny of the Mahdi, yet now you reach it by travelling over 575 miles of the Sudanese Government Railroad in sleeping-car trains, provided with excellent diners and

lighted by electricity, to be received on landing in the Grand Hotel of Khartum—"Grand," however, only by courtesy—owned and run by the L. S. D. Company, which it is believed will mean ultimately Pounds, Shillings, and Pence, but for the present means the emblems of hope of the London Sudanese Development Syndicate. One feature of the railroad management might be imitated midway on our own transcontinental roads. After a dusty night's drive between Wady Halfa and Abu Hamed, over 230 miles of hot and sandy desert, the train stops sufficiently long to enable the passengers to enjoy at their option a hot or cold bath in a clean, well-equipped bathing establishment. All these seem very commonplace and matter-of-fact themes—railroads, dining-cars, sleepers, baths, hotels, etc.—and they are in truth but poor duplicates of what we can enjoy with far less trouble and at far less expense at home. But they are none the less a most inspiring phenomenon in these outskirts of Africa, because they express a most emphatic prophecy and forecast of the speed with which the whole continent will, for better or worse, be forced into the circle of civilization.

The railroad was built as a military measure, but is now an artery of commerce, though still owned and operated by the Government. Before the Sudan was abandoned after Gordon's death, the Egyptian Government planned and commenced accumulating material for a railroad to follow the Nile valley above the First Cataract. Of this road a few miles were subsequently built, and two trains a week are now run over it to New Dongola, whence a steamship service gives access to the once populous and prosperous province of Dongola. It was thus by the river that Kitchener commenced his advance, but before he had proceeded far he decided that it would be quicker and cheaper to lay a track upon the level desert, across the peninsula, which is enclosed by the Nile, between Wady Halfa, at the foot of the Second Cataract, and Abu Hamed, at the head of the Fourth Cataract, where the Nile resumes its north and south course. No engineering difficulty presented itself. The chief dilemma was to secure with sufficient speed the construction material and the equipment. As a consequence of taking what was offered, there are now no less than five different types of locomotives on the road, which was enabled to be built across the desert, and thence along the river bank to Halfaiya, opposite Khartum, at the rate of one mile a day. Delay might have been occasioned in crossing the Atbara River but for the bid for the long bridge by an American firm on promise of prompt delivery, which promise was faithfully kept.

The gauge of the railroad is forty-two inches, and is found so efficient that the same gauge is to be adopted on the Suakin-Berber road, soon to be built, which will virtually throw out of service the existing road from Wady Halfa to Berber; for from Suakin, a port on the Red Sea, to Berber on the Nile is only 240 miles, whereas from Wady Halfa to Berber is 361 miles, and from Alexandria to Wady Halfa is 686 miles by rail and 226 miles by boat. From Berber to Khartum is by rail 216 miles. At present, therefore, to reach Khartum by steamer from the nearest seaport, Alexandria, one travels 1,261 miles by rail and 226 by steamer; whereas, when the Suakin-Berber cut-off is built, Khartum will be brought within reach of a seaport by 455 miles of railroad. And as every act of the Government bespeaks unwavering faith in the future of that rich region, situated between the fertilizing waters of the Blue and the White Niles, and as to prosperity cheap transportation is essential, this further step towards the development of the Sudan must soon be taken. The Suakin-Berber Railroad will traverse a desert, but, except for some 20 miles on the Red Sea littoral, the cost of construction should not exceed that of the Halfa-Abu Hamed section, which it is understood was about $10,000 a mile, for the desert offers as favorable a location for a railroad as the prairie itself, and, in the 243 miles traversed by the Halfa-Abu Hamed section, sand offers less obstacle than a road of equal length in our own Southwest encounters from the same difficulty.

The desert, in approaching the Nile or approaching springs, supports scattered acacia trees, our Western mesquite, and a growth of yuccas and coarse grass like our Western bear grass, but few or no cacti. At however short a distance from water, it presents, for stretches of league after league, an absolute prairie surface, covered with coarse sand and gravel out of which rocky masses rise, attaining sometimes the dignity of short ranges. These are absolutely devoid of vegetation, but streaked to their very summits with yellow sand, which has been blown into their ravines from the adjacent desert, and thus looks from the distance like tawny glaciers. The surface of this vast plain exposed to the action of the high winds has, by a natural sifting process, been deprived of the finer particles of sand, and therefore only such coarse sand and heavy gravel as nothing but a hurricane can move, covers them, and gives the railroad builder a most excellent material for his road bed. Although the whole line from Halfa or Suakin to Khartum is well within the tropics, it is only as Khartum is approached that heavy rains are liable to obstruct traffic during three or four of our summer months. Owing, therefore, to the aridity of the region, the scenery continues for 150 miles further south than Khartum to retain all the characteristics of that of Egypt, and agriculture is and can be practised only by the aid of irrigation. The climate is consequently less enervating than in the moist, forest-clad, and marshy equatorial region; and, though Europeans will not be engaged in the manual labor of winning from the fertile soil its bountiful crops, Europeans can superintend the large industries which will grow up, and can supervise their administration. Mining may even supplement agriculture; for, though it would be premature to count on the profitable production of the baser and more precious metals, they are known to exist. The Mahdi coined a considerable amount of copper. His large pennies, though not current, are sold for a trifle as curiosities. One of them, which I have had analyzed, contains, in addition to the copper, not less than 1,109 ounces of silver and 1.61 ounces of gold to the ton. The metal must have been derived from some native source, as no such copper is in the market.

Khartum lies within the angle formed by the junction of the Blue Nile, which takes its rise in Abyssinia, and the White Nile, which flows out of the Great Lakes. So sharp is the angle that Gordon threw a line of fortifications from one river to the other in order to protect the town. Immediately opposite Khartum, on the Blue Nile, is Halfaiya, the terminus of the Sudan Railroad, where the Government and the Development Company are building large shops, and to which they hope to transfer the trade of Omdurman. This capital of the Mahdi and subsequently of the Khalifa is situated opposite what will be the western suburb of Khartum when it covers the whole angle between the rivers. It extends partially down the bank of the White Nile and of the main river below the junction of its branches. If Khartum represents Europe transplanted into Africa, Omdurman is still Africa undiluted. It stretches for four miles along the river bank, for when it was the depot into which the Khalifa herded the population under the protection or the surveillance of his army, it contained not fewer than 500,000 souls. The people lived in one-storied mud huts lining streets laid out on an orderly system; but the warriors of the Khalifa's own tribe, some 10,000 in number, occupied a walled enclosure flanked with towers, in which they could resist any uprising of the disaffected, and which it would have been difficult for the invading army to take without great loss. The only two-storied house in this great human ant-hill was the house of the Khalifa; that even of the Mahdi was almost indistinguishable from the abode of his followers. Both were built near the great square of prayers, for, in the Sudan, Mohammedan architecture as well as the creed itself is reduced to its simplest elements. There are few or no mosques and no minarets, and therefore it must have been an inspiring sight to view the vast aggregate of humanity filling this grand square at the hour of prayer, and bowing simultaneously in the direction of Mecca.

The simplicity of the monotheistic creed of Mohammed, compared with the more intricate dogmatic system of Christianity, has always appealed strongly to the simple African mind, quite apart from the more attractive heaven which the Prophet promised to his followers. The Arab slave merchant has therefore been generally a successful missionary. But though the tribes of northern Sudan are Moslem, this is not the case with the natives of the Bahr el-Ghazal and others of the southern tribes, among whom the Government encourages Christian missionary effort. The field nevertheless has been occupied by only two agencies, to whom Lord Cromer referred in the following passage of his speech at Khartum last January:

"Let me also testify to the special pleasure which it afforded me to visit the admirably conducted establishments of the American missionaries on the Sobat and that of the Austrians on the White Nile—one Protestant, the other Roman Catholic; but I make no distinction between the two. Both are admirably conducted. I entirely concur with Sir Reginald Wingate and with, I believe, every responsible authority in this country, in thinking that the time is still distant when mission work can be permitted amongst the Moslem population of the Sudan. But such efforts as are now being made amongst the pagan tribes in the southern provinces deserve, and shall certainly receive, any reasonable amount of encouragement and assistance which can be afforded to them."

The material which the missionary will have to work upon is infinitely more tractable than the negro of the West Coast, because intellectually far superior, if one may judge by the fine specimens of the interior tribesmen one sees in the bazaars of Omdurman. It is the great mart of the gum-arabic, ivory, and ostrich-feather trade of northeastern Africa, and representatives of some thirty tribes may be seen in its markets. They are remarkably well formed in frame, and even handsome in features. The prognathous characters of the West Coast face are conspicuously absent; and, though we can well conceive this people to be fierce and sanguinary, their expression is not vicious, and the women are not only stately in figure, but even pretty, in spite of their color.

Omdurman after the battle was almost deserted, but population is returning with trade and with prosperity, and it is now said to harbor about 50,000 inhabitants. Still, only a small section of the original city is occupied, and a mile of empty streets and ruined adobe houses intervenes between the quarter containing the Grand Square, the bazaars, the departmental headquarters and barracks, and the cluster of houses further down the river around the machine shops of the Development Company. Desolation oppresses you, and that death itself was once rampant you are reminded by unearthing human bones as your donkey ploughs through the dust of the streets. Disease in that crowded, unsanitary, starving town must have carried off its hundreds of thousands before the thousands fell on the plain to the north.

The hopeless character of the struggle of barbarism and fanaticism against modern arms and modern methods is well displayed in the heaps of old-fashioned weapons picked up on the Kerreri battlefield. Though the Mahdi had the thousands of modern rifles taken from the obliterated armies of Hicks Pasha and Baker Pasha, and a battery of rapid-fire guns, which is still in his old armory, the most of his men who were provided with any firearms used old-fashioned flint-lock muskets and pistols, which are now heaped in huge piles within the same receptacle of antiquities and sold by the Government to tourists as curiosities for a few shillings apiece. Many are guns of even an older type than the "Old Brown Bess." I picked out a flintlock which, having lost even its primitive mechanism, was fired by a match like an old matchlock.
